Error -4315: Failed to send command to VM

AdminStudio 2019 | Automated Application Converter

The following table documents this message:

**Table 10-73 • Error -4315: Failed to send command to VM**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Message:</strong></td>
<td>Error -4315 controlling virtual machine: Failed to send command to VM</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>There was a network error sending a command from the host machine to the Guest Agent on the virtual machine.</td>
</tr>
</tbody>
</table>
| **Resolution:** | To resolve this error, try the following:  
- Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer).  
- Verify that the Guest Agent running on the virtual machine has not crashed.  
- Update the Guest Agent on the virtual machine by running the latest version of the Virtual Machine Preparation Tool (VMCfg.exe) and taking a new snapshot. |

Error -4316: Failed getting response from VM

AdminStudio 2019 | Automated Application Converter

The following table documents this message:

<tr>
<td><strong>Cause:</strong></td>
<td>The Automated Application Converter did not receive a response from the virtual machine.</td>
</tr>
</tbody>
</table>
| **Resolution:** | To resolve this error, try the following:  
- Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer).  
- Verify that the Guest Agent running on the virtual machine has not crashed.  
- Update the Guest Agent on the virtual machine by running the latest version of the Virtual Machine Preparation Tool (VMCfg.exe) and taking a new snapshot. |
## Error -4317: Failed running pre-snapshot

AdminStudio 2019 | Automated Application Converter

The following table documents this message:

**Table 10-75 • Error -4317: Failed running pre-snapshot**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message:</td>
<td>Error -4317 processing package: Failed running pre-snapshot</td>
</tr>
<tr>
<td>Cause:</td>
<td>The virtual machine could not create the output cache location or could not run Repackager.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this error, try the following:</td>
</tr>
</tbody>
</table>

- Ensure that the host machine has access to the network and is visible to/accessible from the virtual machine (if it is running on a different computer).
- Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly.
- Verify that the virtual machine’s **Output Cache Path** and **Repackager Cache Path** properties on the **Machines** tab for this virtual machine are set to a drive on the virtual machine, especially if the virtual machine does not have a C: drive.
- Consider changing the **Repackaging Method** property for the package to **Installation monitoring**, which would eliminate the need for a pre-snapshot.

## Error -4318: Failed running post-snapshot

AdminStudio 2019 | Automated Application Converter

Troubleshooting

Error -4320: Failed creating folder on VM

AdminStudio 2019 | Automated Application Converter

The following table documents this message:

Table 10-78 • Error -4320: Failed creating folder on VM

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message:</td>
<td>Error -4320 processing package: Failed creating folder on VM</td>
</tr>
<tr>
<td>Cause:</td>
<td>Virtual machine was unable to create the Setup Cache folder.</td>
</tr>
</tbody>
</table>

Note • This error may be related to Error -4313: Failed to access the package.

Resolution:

• Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer).

• Verify that the Guest Username and Guest Password properties on the Machines tab for the virtual machine are set correctly.

• Verify that the virtual machine’s Setup Cache Path property on the Machines tab for this virtual machine is set to a drive on the virtual machine, especially if the virtual machine does not have a C: drive.

Error -4333: Preparing command-line...

AdminStudio 2019 | Automated Application Converter

The following table documents this message:

Table 10-79 • Error -4333: Preparing command-line...

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message:</td>
<td>Error -4333 processing package: Preparing command-line...</td>
</tr>
<tr>
<td>Cause:</td>
<td>The virtual machine could not query the associated program for the provided extension.</td>
</tr>
</tbody>
</table>

Resolution:

• Ensure that the virtual machine has access to the network and is visible to/accessible from the host machine (if it is running on a different computer).

• Verify that the package’s source file (as specified in the Setup Cache Path property on the Machines tab) can run when double-clicked on the virtual machine.

• If any special tools are required (script engines, etc.) to run the command line, install them on the virtual machine and retake the snapshot.
Error -4380: Failed to prepare AppV

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message:</td>
<td>Error -4389 controlling virtual machine: Failed connecting to server</td>
</tr>
<tr>
<td>Cause:</td>
<td>The Automated Application Converter was unable to connect to the virtual machine server. The server machine may be unavailable.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this error, try the following:</td>
</tr>
<tr>
<td></td>
<td>• Verify that the Server Address, Server Username, and Server Password properties under Virtual Machine Server on the Machines tab are set correctly for this virtual machine.</td>
</tr>
<tr>
<td></td>
<td>• Verify that the Hyper-V or VMware ESX/ESXi server is running.</td>
</tr>
<tr>
<td></td>
<td>• Ensure that the virtual server has access to the network and is visible to/accessible from the host machine (if it is running on a different computer).</td>
</tr>
<tr>
<td></td>
<td>• If you are using VMware and you received XE values 22002 (55F2) or 22003 (55F3), verify that the VMware vSphere API is installed. See VMware vSphere API Requirement on the AdminStudio Machine.</td>
</tr>
</tbody>
</table>
Error -4390: Failed connecting to image

The following table documents this message:

**Table 10-83 • Error -4390: Failed connecting to image**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Message:</strong></td>
<td>Error -4390 controlling virtual machine: Failed connecting to image</td>
</tr>
<tr>
<td><strong>Cause:</strong></td>
<td>The Automated Application Converter was unable to connect to the virtual machine. The virtual machine may be unavailable or the virtual machine credentials may be incorrect.</td>
</tr>
</tbody>
</table>
| **Resolution:** | To resolve this error, try the following:  
* Verify that the virtual machine has not been deleted.  
* Verify that the **Guest Username** and **Guest Password** properties on the **Machines** tab for the virtual machine are set correctly.  
* If you are using VMware ESXi Server and you received an XE value of 0020 (corresponding to a **vSphere.E_LICENSE** error), this indicates that you may need to purchase a license for your VMware ESXi Server in order to use it with the Automated Application Converter. |

Note • This error may be related to Error -4313: Failed to access the package.
Virtualization Conversion Error Messages

When converting a Windows Installer package to a virtual application, error and warning messages are generated. Some of these messages are generic to package virtualization, and others are specific to the virtualization solution you are preparing packages for.

This section includes information on how to resolve error messages that could be generated by during virtualization using the Automated Application Converter, App-V Assistant, VMware ThinApp Assistant, and Citrix Assistant.

Troubleshooting

Table 10-93 • Error -9006: Error Decompressing Package

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cause:</td>
<td>You encounter this error when the package is a compressed Windows Installer package (.msi) and errors were generated when AdminStudio attempted to perform an administrative installation to extract the files.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>When this error occurred, you should have also received a return error code from Windows Installer. Look up that error code in the Windows Installer Help Library to determine the cause of the problem. If you did not receive a return error code from Windows Installer, this error could have been caused by the package not being authored properly. In the Windows Installer package, check to see if the AdminExecuteSequence table was defined. If that table is missing, the package cannot be decompressed.</td>

</table>

Warning -9018: Custom Actions Ignored

The following table documents this message:

Table 10-105 • Warning -9018: Custom Actions Ignored

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Warning</td>
</tr>
<tr>
<td>Message</td>
<td>Custom action 'CustomActionName' will be ignored.</td>
</tr>
<tr>
<td>Cause</td>
<td>When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile.</td>
</tr>
</tbody>
</table>

Note • When a custom action that does not modify the system or perform any part of the installation (such as an InstallShield Editor predefined custom action or a Type 19 custom action) is encountered, no message is generated. If a Type 51 custom action is encountered (which sets a property from a formatted text string), it is automatically resolved. If a Type 35 custom action is encountered, it is only resolved if it is referenced in the Directory table.
Warning -9019: Conditionalized Components

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>There exist one or more conditionalized components which may not be converted correctly</td>
</tr>
<tr>
<td>Cause:</td>
<td>This warning is generated when attempting to convert conditionalized components because conditions on components are not evaluated.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Repackage the application on a machine that has a similar environment to the machines where the profile will be deployed. Then rebuild the Citrix profile. You can also evaluate the conditions on the listed components and remove the components you know are not needed for your target machines. Then rebuild the Citrix profile.</td>
</tr>

</table>
Error -9020: Directory With Null Parent

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

Table 10-107 • Error -9020: Directory With Null Parent

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type: Error</td>
<td></td>
</tr>
<tr>
<td>Message: Directory 'DirectoryName' has a null parent and will be ignored.</td>
<td></td>
</tr>
<tr>
<td>Cause: This error occurs if a directory table entry (other than TARGETDIR) is null.</td>
<td></td>
</tr>
<tr>
<td>Resolution: Evaluate the ThinApp application to see if it works. If it does not work properly, you may want to consider repackaging the package.</td>
<td></td>
</tr>
</tbody>
</table>

Error -9021: Unable to Extract COM Data

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

Table 10-108 • Error -9021: Unable to Extract COM Data

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type: Error</td>
<td></td>
</tr>
<tr>
<td>Message: Unable to extract COM data for 'FileName'</td>
<td></td>
</tr>
<tr>
<td>Cause: This Windows Installer package has an entry in the TypeLib or SelfReg table that contains COM data that AdminStudio cannot convert to application data. Depending upon which file cannot be COM extracted, it is possible that this application will still work properly in Citrix XenApp isolation environment if you repackage this Windows Installer package with COM table mapping turned off. COM data is stored in the Windows Registry. So, if you repackage this Windows Installer package, the capture process will be able to obtain all of this data because it captures all modifications to the Registry and does not have to rely on COM extraction.</td>
<td></td>
</tr>
<tr>
<td>Resolution: To resolve this issue, you need to repackage your Windows Installer package with COM table mapping turned off.</td>
<td></td>
</tr>
</tbody>
</table>
Error -9022: Complus Table

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

Table 10-109 • Error -9022: Complus Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'Complus'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a Complus table. During the conversion process, the Complus table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The Complus table contains information needed to install COM+ applications. While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, this application cannot be deployed on Citrix XenApp.</td>
</tr>
</tbody>
</table>

Error -9024: FileSFPCatalog

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

Table 10-110 • Error -9024: FileSFPCatalog

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'FileSFPCatalog'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a FileSFPCatalog table. During the conversion process, the FileSFPCatalog table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The FileSFPCatalog table associates specified files with the catalog files used by system file protection. If this file is necessary for the function of the application, you need to use Repackager to repackage the application.</td>
</tr>
</tbody>
</table>
Warning -9026: LaunchCondition Table

The following table documents this message:

**Table 10-111 • Warning -9026: LaunchCondition Table**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'LaunchCondition'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this warning when the Windows Installer package that you are converting includes a LaunchCondition table. During the conversion process, the LaunchCondition table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The LaunchCondition table contains a list of conditions that all must be satisfied for the installation to begin. For example, if an application requires Windows 7 to run, Windows 7 is listed in the LaunchCondition table. Because this table is not read, no check is performed. Therefore, when a user on an operating system other than Windows 7 launches this Citrix profile, the application may not function properly. To resolve this issue, perform one of the following tasks:</td>
</tr>
<tr>
<td></td>
<td>• Option 1: Set Requirements on the Profile Requirements Page—If the launch conditions only include operating system, service pack, and language requirements, open this package in the InstallShield Editor Citrix Assistant / ThinApp Assistant, and set those Operating System and Language requirements on the Profile Requirements page. Then deploy this application as a Citrix profile.</td>
</tr>
<tr>
<td></td>
<td>• Option 2: Determine if Launch Conditions are Met—Review the launch conditions listed in the table, and determine if the desktops in your enterprise meet those requirements. If all of the desktops meet those requirements, you can deploy this application as a Citrix profile. If the desktops do not meet those requirements, upgrade those desktops to meet these requirements, and then deploy this application as a Citrix profile.</td>
</tr>
</tbody>
</table>

Warning -9027: LockPermissions Table

</tbody>
</table>
Troubleshooting

**Error -9028: MoveFile Table**

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message.

Table 10-113 • Error -9028: MoveFile Table

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'MoveFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a MoveFile table. During the conversion process, the MoveFile table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>This MoveFile table contains a list of files to be moved or copied from a specified source directory to a specified destination directory. Because this table is not read, you need to do one of the following to resolve this issue:</td>
</tr>
<tr>
<td></td>
<td>• Option 1: Edit the Windows Installer Package—Open the Windows Installer package in InstallShield Editor and modify it to eliminate the use of the MoveFile table by installing additional files in the specified directories.</td>
</tr>
<tr>
<td></td>
<td>• Option 2: Repackage the Application—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</td>
</tr>
<tr>
<td></td>
<td>• Option 3: Write a Pre-Launch Script—Write a pre-launch script that performs the file moving operations identified in the MoveFile table upon application launch.</td>
</tr>
</tbody>
</table>
## Error -9029: MsiDriverPackages Table

### Description

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'MsiDriverPackages'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a MsiDriverPackages table. During the conversion process, the MsiDriverPackages table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The MsiDriverPackages table includes one record for each driver package component in the application. Citrix XenApp does not support any type of driver. For example, when installing a printer, you can install the printer software within the isolation environment, but not the printer drivers. Therefore, to resolve this issue, you need to install any required drivers outside of the isolation environment on the user desktop machines.</td>
</tr>
</tbody>
</table>

## Warning -9030: ODBCTranslator Table

### Description

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'ODBCTranslator'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a ODBCTranslator table. During the conversion process, the ODBCTranslator table is not read.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The ODBCTranslator table lists the ODBC translators belonging to the installation. ODBC translators translate one form of raw data into another form that can be used with a specific database type. Ignoring the ODBCTranslator table should not prevent your application from functioning properly. However, if it does, you need to use Repackager to repackage the application.</td>
</tr>

</table>
Error -9039: ISSQLScriptFile Table

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

**Table 10-122 • Error -9039: ISSQLScriptFile Table**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The conversion process does not support data in the MSI table 'ISSQLScriptFile'.</td>
</tr>
<tr>
<td>Cause:</td>
<td>You encounter this error when the Windows Installer package that you are converting includes a <strong>ISSQLScriptFile</strong> table. During the conversion process, the <strong>ISSQLScriptFile</strong> table is not read.</td>
</tr>
</tbody>
</table>
| Resolution: | The **ISSQLScriptFile** table lists SQL scripts. When a Windows Installer package is installed, it can run an SQL script to update a database. An application running as a Citrix profile cannot update a database. To resolve this issue, you need to update the database prior to using the converted Citrix profile using one of the following methods:  
  - Use scripts to update the database manually.  
  - Update it by running the Windows Installer installation on one of the machines in your network that has access to that database. |

Error -9040: ISVRoot Table

</tr>
</tbody>
</table>
Warning -9136: Some Files May Not Be Decompressed

The following table documents this message:

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message:</td>
<td>Some files may not be decompressed from this package because it contains features with a default install level of 0.</td>
</tr>
<tr>
<td>Cause:</td>
<td>When installing a compressed Windows Installer package, the build engine runs an administrative installation of it to decompress it. One limitation of an administrative installation is that it does not decompress a file if the feature it is contained in has a default install level of 0. If there are any files in any components contained within those features, AdminStudio will generate an error when it attempts to copy those files into the Citrix profile, because they will not exist in the source location.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>To resolve this issue, edit the Windows Installer package and set the default install level of that feature to something other than 0.</td>
</tr>
</tbody>
</table>

Warning -9137: Destination Directory Cannot Be Found

The following table documents this message:

<table>
<thead>
<tr>

<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>The destination directory for the 'FileName' file cannot be found. You should consider Repackaging this application before proceeding with the conversion process.</td>
</tr>
<tr>
<td>Cause:</td>
<td>This is an internal error.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Contact AdminStudio Technical Support.</td>
</tr>
</tbody>
</table>
Warning -9138: Ignoring a DuplicateFile Table Entry

AdminStudio 2019

The following table documents this message:

**Table 10-161 • Warning -9138: Ignoring a DuplicateFile Table Entry**

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
<tr>
<td>Message:</td>
<td>Ignoring a DuplicateFile table entry because unable to resolve the property used for the DestFolder: 'INVALIDPATH'</td>
</tr>
<tr>
<td>Cause:</td>
<td>You might encounter this error when the Windows Installer package that you are converting includes one or more entries in the DuplicateFile table, and a property that is used in the DestFolder column for one of those entries in the DuplicateFile table cannot be resolved. For example, if the destination for a duplicate file is set by a custom action, that destination cannot be resolved during the conversion.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>The DuplicateFile table contains a list of files that need to be duplicated during installation, either to a different directory than the original file or to the same directory but with a different name. Because a destination in this table cannot be resolved, you need to do one of the following to resolve this issue:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Option 1: Edit the Windows Installer Package</strong>—Open the Windows Installer package in InstallShield and modify it to eliminate the use of the problematic entry in the DuplicateFile table by including any additional copies of that file.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Option 2: Repackage the Application</strong>—Use the Repackaging Wizard to repackage this application, and then build the Repackager project to generate a revised Windows Installer package.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Option 3: Write a Pre-Launch Script</strong>—Write a pre-launch script that—upon application launch—performs the file copy operations for the problematic entry in the DuplicateFile table.</td>
</tr>
</tbody>
</table>

</table>

**Error -9422: Package Cannot Be Opened**

AdminStudio 2019 | Automated Application Converter / Microsoft App-V Assistant

The following table documents this message:

Table 10-202 • Error -9422: Package Cannot Be Opened

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Error</td>
</tr>
<tr>
<td>Message:</td>
<td>The previous package '[SFT_FILE_NAME]' could not be opened. Please verify that the package is a valid SFT file.</td>
</tr>
<tr>
<td>Cause:</td>
<td>This error indicates that there was a problem reading information from the previous .sft file which is necessary to configure an upgrade. This could mean that the previous .sft file is corrupt, missing, or is not really an .sft file.</td>
</tr>
<tr>
<td>Resolution:</td>
<td>Verify that the file is present and accessible. Verify that the file is not corrupt. One way this could be done is by trying to deploy the App-V package on a machine with the App-V client.</td>
</tr>
</tbody>
</table>

**Warning -9423: No Shortcuts Detected**

AdminStudio 2019 | Automated Application Converter / App-V Assistant / ThinApp Assistant / Citrix Assistant

The following table documents this message:

Table 10-203 • Warning -9423: No Shortcuts Detected

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td>Warning</td>
</tr>
</tbody>
</table>
Table 10-203 • Warning -9423: No Shortcuts Detected

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
</table>
| Message  | For App-V packages:  
No shortcuts were detected in the source package. This can be a valid scenario for packages with file type association entry points and/or those that are meant to be dependencies of other App-V packages through the use of Dynamic Suite Composition functionality.  
For XenApp and ThinApp packages:  
This package contains no shortcuts. Shortcuts are necessary to define the entry point into the virtual application. |

| Cause | Package contains no shortcuts.  
• **App-V**—For conversion to App-V packages, this issue is acceptable in some scenarios, such as packages which provide dependencies to others which dynamically suite it. However, if this package merely provides a plug-in to another application, it must contain a shortcut to launch that application in this package’s virtual context.  
• **ThinApp and XenApp**—For conversion to ThinApp and XenApp formats, shortcuts are necessary to define the entry point into the virtual application. |

| Resolution: | One potential resolution to this issue is to use InstallShield Editor to add shortcut(s) to the Windows Installer package. |

Error -9424: Windows 8 or Windows 2012 OS Required

<td>Automated Application Converter will exclude the shortcut to the .URL file.</td>
</tr>
</tbody>
</table>
Steps to Take Before Calling Technical Support

Before contacting AdminStudio Technical Support, perform the following steps to attempt to clearly identify the problem you are having:

- **Check package**—To determine if this error is caused by a problem with the specific package you are converting, try to build a virtual package of a simple package that contains only one file.

- **Check machine and OS**—To determine if this error is caused by a configuration on a particular machine or operating system, attempt to build this virtual package on another machine or operating system.

- **Check prerequisites**—Check to make sure that the machine where you are performing the conversion has all of the required prerequisite software installed:
  - **App-V**—See Comparison of the App-V 5.0 Conversion Methods.
  - **VMware ThinApp**—See Prerequisites for Building a ThinApp Application.

- **Check individual files**—To determine if this error is limited to a specific item, find out if removing or excluding a particular item will build error free.

Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the application profile to run on Citrix XenApp.

One action you could take to try to include ignored features in a Citrix profile is to first repackage the application using the Repackaging Wizard, and then convert the repackaged application to a Citrix profile.
The following table lists the application features which require additional, manual conversion steps:

**Table 10-225 • Application Features Ignored During Profile Conversion**

<table>
<thead>
<tr>
<th>Windows Installer Feature</th>
<th>Manual Conversion Steps</th>
</tr>
</thead>
</table>
| **User-Defined Custom Actions**   | When converting a Windows Installer package to a Citrix profile, all custom actions are ignored. For user-defined custom actions, a warning message is generated. Any modifications to a target machine that a custom action in this Windows Installer package may create will not be propagated into the Citrix profile. The resolution that you should perform depends upon the purpose of the custom action:  
  - If the custom action merely automatically enters a value or makes some other kind of minor modification, you can ignore this warning.  
  - If the custom action does something which could change the behavior of the installation (such as setting a Property), you may need to resolve this issue.  
  
To resolve this issue, first attempt to launch the converted package on Citrix XenApp. If you receive any application errors, you need to repackage this application, by performing the following steps.  

  * **To successfully convert a package with user-defined custom actions:**  
    1. Use the Repackaging Wizard to repackage this application. The Repackaging Wizard monitors system changes as an application is installed, and then that data is converted into a Repackager project.  
    2. Build the Repackager project to generate a revised Windows Installer package. This new Windows Installer package does not contain any custom actions, but (as a result of being repackaged) it will include the functionality performed by the original custom action.  

| Services                          | Citrix XenApp does not support any type of services. Therefore, to resolve this issue, you need to install any required services outside of the isolation environment on the user desktop machines.  

  * **To successfully convert a package with services:**  
    1. If you have an application and a service bundled in the same Windows Installer package, you need to create a separate Windows Installer package containing just the service.  
    2. Install the service on each of the user desktop machines. The Citrix profile of this application should now be able to run in an isolation environment on machines that already have the service installed.  

While Citrix XenApp supports communicating with COM+ applications, it does not support installing COM+ services. Therefore, an application that contains COM+ services cannot be deployed on Citrix XenApp.

### Table 10-225 • Application Features Ignored During Profile Conversion

About Virtualization

Virtualization enables you to isolate an application in its own environment so that it does not conflict with existing applications or modify the underlying operating system.
Limitations of a Standard Installation Environment

A typical Windows-based application has dependencies on components that are shared by multiple applications. Applications access these shared system resources, such as the registry or Windows system files. When an installation author recognizes that their application references a shared system component, they include a merge module to install that component.

When one of these shared components is installed, it is possible that a previously installed version of the same component could be overwritten; this may cause the existing application to break. A similar problem could occur when one of these applications containing a shared component is uninstalled. Because of these possible problems, extensive compatibility testing needs to be performed before an application can be distributed in the enterprise environment.

The following diagram provides an example of two conflicting installed applications.

![Example of Conflicts Between Two Installed Applications](image)

**Figure 11-1:** Example of Conflicts Between Two Installed Applications

Benefits of Application Virtualization

Virtual applications run in virtual environments that keep each application layer and the operating system layer separate. Each application includes its own configuration information in its virtual environment. As a result, many applications can run side-by-side with other applications on the same computer without any conflicts.

Even though virtual applications are not installed on the local machine, they exhibit the same functionality and access to local services as locally installed applications, and also nearly the same performance characteristics.

The following diagram provides an example of how application virtualization would solve the conflicts that are shown in the previous example.
Application virtualization allows the configuration of an application to be standardized to an isolation environment, rather than to an individual user’s desktop machine. Application objects, files, and registry settings are contained within this isolation environment. Critical application resources are managed locally by the isolation environment, thus minimizing resource dependencies between applications.

Application virtualization greatly reduces the scope for conflicts between applications and, therefore, simplifies regression testing.

About the Virtual Package Editor

About the Virtual Package Editor

Microsoft Application Virtualization (App-V) enables you to deploy applications to end users without requiring the applications to be installed locally; only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middleware, plug-ins, and other applications. Using App-V enables you to centralize the deployment of applications and reduce application-to-application conflicts.

The Virtual Package Editor is a powerful tool that lets you edit App-V packages to customize your App-V applications, resolve virtualization best practice issues and application conflicts, and fix run-time problems. You can save your App-V packages as new packages that can be deployed alongside earlier versions of the virtual package in the same virtual environment; you can also create update packages that can upgrade earlier versions of your virtual applications.
Components of an App-V Package

AdminStudio 2019 | Virtual Package Editor

The files that comprise an App-V package depend on the version of the App-V package.

**Components of an App-V 5 Package (.appv)**

The following table describes the main components of an App-V 5 package (.appv):

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.appv</td>
<td>The .appv file is the compressed package file that contains all of the other parts of the package.</td>
</tr>
<tr>
<td>[Content_Types].xml</td>
<td>This file contains a list of file extensions that the package supports and the type of content to which each extension type maps.</td>
</tr>
<tr>
<td>AppxBlockMap.xml</td>
<td>This file contains a list of files with details such as header size and file size.</td>
</tr>
<tr>
<td>AppxManifest.xml</td>
<td>This file contains metadata about the package.</td>
</tr>
<tr>
<td>FilesystemMetadata.xml</td>
<td>This file contains information such as short file names, the directory-file hierarchy, and the mapping between the root folder and INSTALLDIR.</td>
</tr>
<tr>
<td>Registry.dat</td>
<td>This file contains registry data for the package.</td>
</tr>
<tr>
<td>StreamMap.xml</td>
<td>This file contains feature block 1 information.</td>
</tr>
</tbody>
</table>

**Components of an App-V 4.x Package (.sft)**

The following table describes the main components of an App-V 4.x package (.sft):

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.sft</td>
<td>The .sft file contains all of the files, registry information, and other configuration details of the package.</td>
</tr>
<tr>
<td>Manifest file</td>
<td>This file is an XML file that lists all of the .osd files in an App-V application.</td>
</tr>
<tr>
<td>.osd</td>
<td>The .osd files are XML-based files that describe the package’s individual targets (or applications) that can be run.</td>
</tr>
<tr>
<td>.ico</td>
<td>The .ico files are icons files that are used for published shortcuts and file type associations.</td>
</tr>
</tbody>
</table>
Chapter 11  Using the Virtual Package Editor

Getting Started with the Virtual Package Editor

The Virtual Package Editor provides powerful features that make editing virtual packages easy. This section of the documentation contains information to help you become familiar with the Virtual Package Editor, begin editing a virtual package, and customize the Virtual Package Editor user interface.

See Also
About Virtualization

Starting the Virtual Package Editor

To open the Virtual Package Editor, do one of the following:

- On the Tools tab in AdminStudio, right-click Virtual Package Editor and then click Launch Tool.
- Launch Application Manager. On the Products tab, right-click an existing App-V package that you want to open, and then click Edit with Virtual Package Editor.

When you launch the Virtual Package Editor through the Tools tab, the Start Page opens. The Start Page provides access to product information, recently opened virtual packages, and product resources.

If you launch the Virtual Package Editor by opening a virtual package in the Application Manager, the Virtual Package Editor displays one of the views for the virtual package.

Virtual Package Editor Start Page
Opening an Existing Virtual Package

Opening an Existing Virtual Package

The Virtual Package Editor offers several ways to open an existing virtual package (.appv or .sft).
Task  

**To open an existing virtual package:**

1. Do one of the following:
   - On the **File** menu, click **Open**.
   - Press CTRL+O.
   - On the toolbar, click the **Open** button.
   - On the **Start Page** in the **Package Tasks** area, click the **Open an Existing Package** link.

   The **Open** dialog box opens.

2. Browse to the virtual package (.appv or .sft), and then click the **Open** button.

   The Virtual Package Editor opens the virtual package, enabling you to edit it as needed.

**Tip**  
As an alternative, you can open a recently opened virtual package. To do so, perform one of the following tasks:

- On the **Start Page** in the **Package Tasks** area, click the **Open an Existing Package** link.
- On the **File** menu, click a recently opened .appv or .sft file name.

You can also open a virtual package from within Application Manager: On the **Products** tab, right-click an existing App-V package that you want to open, and then click **Edit with Virtual Package Editor**. Application Manager lets you check out the file. When you save the virtual package in the Virtual Package Editor, your changes are saved in a temporary location. The version that is stored in Application Manager is updated when you check your changes in to the Application Manager.

### Saving a Virtual Package

The Virtual Package Editor offers several machine-wide, user-specific options for saving a virtual package (.appv or .sft). Before you save your virtual package as either a new package or an upgrade package, select the appropriate options.
Selecting the Appropriate Save Options

To select the appropriate save options:

On the **File** menu, point to **Save Options**, and then click the appropriate command to select or clear an option. The following table describes each option. If an option is selected, its menu command includes a check mark.

### Table 11-4 • Save Options

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Include App-V Launcher</strong></td>
<td>If you want to use the AdminStudio App-V Application Launcher to test a newly built App-V package locally before moving it to a deployment server, select this command. To learn more, see <em>Using the App-V Application Launcher to Test the Virtual Package</em>. This command is selected by default.</td>
</tr>
<tr>
<td><strong>Append Package Version</strong></td>
<td>If you want the Virtual Package Editor to append the package version number to the name of the file whenever you save an App-V package, select this command. This command is selected by default.</td>
</tr>
<tr>
<td><strong>Build Wrapper MSI</strong></td>
<td>If you want to build a Windows Installer package to assist in the distribution of each App-V package that you save in the Virtual Package Editor, select this command. If you enable this option, the Virtual Package Editor creates an InstallShield project (.ism file) and uses it to build an .msi package. If you run the .msi package, it “installs” the App-V application files in the local App-V client system cache. The wrapper .msi package can optionally include the App-V package, depending on whether the Include SFT in Wrapper MSI command is selected.</td>
</tr>
</tbody>
</table>

**Note** • The Microsoft Application Virtualization Client must be installed on the local machine before you can install an App-V application through a wrapper .msi package. The installation determines whether the App-V client is present; if it is not, the installation displays an error message and exits.

Building a wrapper .msi file simplifies the deployment of an App-V application by enabling you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management.

This command is cleared by default.
You can save a virtual package in either of the following ways:

- Save the package as a new package. You can deploy a new package alongside earlier versions of the virtual package in the same virtual environment.
- Save the package as an update package. An update package can upgrade earlier versions of the virtual application.

**Tip** • *If you are using the Virtual Package Editor to edit a virtual package that is part of your application catalog, the Virtual Package Editor saves your changes in a temporary location. To update your application catalog with the latest changes to your virtual package, use Application Manager to check in your virtual package.*

### Saving a Virtual Package as a New Package

**Task** • *To save a virtual package as a new package, do one of the following:*

- On the File menu, click **Save**.
- Press CTRL+S.
- On the toolbar, click the **Save** button.

The Virtual Package Editor saves your virtual package as a new package. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.
Important • If you want to deploy two copies of a package side by side, you must do some additional work before saving the package:

- In the General Information view, change the value of the Root Folder Name setting. This value must be unique because two packages with the same root folder name cannot be deployed simultaneously.
- In the General Information view, change the value of the Name setting. It is recommended that this value be different for each package.
- In the Shortcuts view, change the value of the Name setting, the Target Version setting, or both of those settings for each target in your package. The combination of the name and version must be unique for the targets in each new package; otherwise, the two packages cannot be deployed simultaneously.

**Saving a Virtual Package as an Update Package**

**Task**  
To save a virtual package as an update package:

1. On the **File** menu, click **Save As**. The **Save As** dialog box opens.
2. Click the **Save as a new package** option.

The Virtual Package Editor saves your virtual package as an update package. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.

**Saving a Virtual Package (an Update Package or a New Package) with a New Name and Location**

1. On the **File** menu, click **Save As**. The **Save As** dialog box opens.
2. In the **Virtual Package** box, enter the path and file name that you want to use for the .appv or .sft file. As an alternative, you can click the ellipsis button (...) to browse to the file.
3. Click the **Save as an update package** option or the **Save as a new package** option.

The Virtual Package Editor saves your virtual package as specified. To open a Windows Explorer window that shows the App-V package, press CTRL+E, or on the View menu, click Show in Explorer.

**See Also**  
Using the App-V Application Launcher to Test the Virtual Package

**Closing a Virtual Package**

**Task**  
To close a virtual package in the Virtual Package Editor:

1. Select the tab of the file that you want to close.
2. Do one of the following:
   - On the **File** menu, click **Close**.
• Click the tab’s **Close** button.

**See Also**

Opening an Existing Virtual Package

---

**Working with the Virtual Package Editor Interface**

The Virtual Package Editor interface is a graphical user interface with conventional Windows-based elements such as a menu bar, a toolbar, and dialog boxes. This section includes topics that explain how to perform basic tasks using these elements and how to customize the interface.

---

**Configuring the Value of a Setting for More Than One Item at a Time**

In many views of the Virtual Package Editor, you can select multiple items—such as files, registry keys, file extensions, or virtual services—and then change the value for one of the settings. The Virtual Package Editor lets you use the same value in that setting for all of the selected items in that view. This feature may save you time by enabling you to make extensive changes to multiple items simultaneously, instead of requiring you to edit the setting for each item individually.

For example, in the Files and Folders view, you may want to change the value of the **Isolation** setting for a large number of folders. If all of the folders need to be configured the same way, you can simply select all of the pertinent folders, and then change the value of the Isolation setting as needed. Therefore, it is not necessary to separately select and configure each folder that you want to modify.

Note that the values of some settings may not be equivalent for each selected item. For example, your virtual package may contain one folder whose Isolation setting is **Override**, and another file whose Isolation setting is **Merge**. If you select both of those folders in the Files and Folders view, you will see the following unequal sign as the value of the Isolation setting, indicating that the selected items have different values:

≠

In this example, you can select both folders and select the appropriate value—**Override** or **Merge**—to have the Virtual Package Editor use the same value for both folders.

In some cases, the Virtual Package Editor does not allow you to change unequal values for more than one selected item. For example, if you select two files that are in the same folder, you cannot change the value of the **Name** setting for both of those files simultaneously, since each file in a folder must have a different file name.

***Note***: If you select two or more items and you want to delete the entry in a setting that shows the unequal sign to indicate different values, you must first enter a value in the setting; then you can delete that value. For example, if you want to delete the value of the **Description** setting for two selected file extensions, and those file extensions have different values in the **Description** setting, you must first enter a value, so that they both match. Then you can delete that value for both file extensions at the same time.

The Virtual Package Editor provides several methods for selecting multiple items in a view.
To select multiple items in a view so that you can configure some of their settings simultaneously, do one of the following:

- To select multiple consecutive items that are near each other, drag your mouse pointer to create a box that surrounds each item that you want to select. When you do this, ensure that you start dragging your mouse pointer in empty space; otherwise, you may drag one or more item to a new location.
- To select multiple consecutive files or folders, select the first file or folder, press and hold SHIFT, and select the last file or folder.
- To select multiple nonconsecutive files or folders, select one file or folder, press and hold CTRL, and select each additional file or folder.

Configuring the Isolation Setting for All of the Subkeys Under One or More Keys

Showing or Hiding the Start Page in the Virtual Package Editor

The Virtual Package Editor Start Page is a tab that provides quick access to product information, to recently opened projects, and to Virtual Package Editor resources. You can show or hide this tab as necessary.

To show the Start Page:
On the File menu, click Start Page.

To hide the Start Page, do one of the following:
- On the Start Page tab, click the Close button.
- Click the Start Page tab. On the File menu, click Close.

Virtual Package Editor Start Page

Rearranging the Start Page and Virtual Package Tabs

Each virtual package that you have open in the Virtual Package Editor is displayed on a separate tab. The Start Page is also displayed on a separate tab. The Virtual Package Editor lets you change the order of these tabs.

To change the order of the open tabs:
Drag the tab that you want to move to the new location in the rows of tabs.
Showing or Hiding the Settings and Output Windows

The Settings window in the Virtual Package Editor contains a grid that lists information about the item that is selected in an open view. The Output window displays task-specific information such as details about the virtual package that you are opening. It also shows save information.

The Settings window and the Output window can be shown or hidden as necessary.

**Task**

To show or hide the Output window or the Settings window:

On the View menu, click Output Window or click Settings.

If the window was visible, the Virtual Package Editor hides it. If the window was hidden, the Virtual Package Editor shows it.

Note that closing the Output window clears its contents. The Virtual Package Editor automatically shows the Output window whenever a task—such as saving or opening a virtual package—generates output.

Moving the Settings, Output, and Script Windows

The Settings window, the Output window, and the Script window can be moved to any side of the workspace in the Virtual Package Editor.

If you drag the Settings, Output, or Script window to the edge of a different side of the Virtual Package Editor interface, it becomes a docked window in that location.

**Task**

To move the Settings window, Output window, the or the Script window:

Drag the title bar of the Settings window, the Output window, or the Script window to the new location. Resize the window as needed.

**See Also**

Getting Started with the Virtual Package Editor

Showing or Hiding Toolbars

Task  To show or hide a toolbar, do one of the following:

- Right-click a toolbar and select the toolbar that you want to be displayed or hidden.
- On the View menu, point to Toolbars, and then click Customize. The Customize dialog box opens. Select the check box for each toolbar that you want to be displayed. Clear the check box for each toolbar that you want to be hidden.

Adding Buttons and Menus to a Toolbar

Task  To add a button or menu to a toolbar:

1. Ensure that the toolbar that you want to change is visible.
2. On the View menu, point to Toolbars, and then click Customize. The Customize dialog box opens.
3. Click the Commands tab.
4. In the Categories box, click the category for the button or menu that you want to add.
5. Drag the button or menu from the Commands box to the appropriate toolbar.

Tip  To create your own custom toolbar, drag the button or menu to the empty gray area near the toolbars.

Creating a Custom Toolbar

Removing Buttons and Menus from a Toolbar

Task  To remove a button or menu from a toolbar:

1. Ensure that the toolbar that you want to change is visible.
2. On the View menu, point to Toolbars, and then click Customize. The Customize dialog box opens.
3. Right-click the button or menu that you want to remove, and then click Delete.
Creating a Custom Toolbar

To create a custom toolbar:

1. On the View menu, point to Toolbars, and then click Customize. The Customize dialog box opens.
2. Click the Tools tab.
3. Click the New button. The New Toolbar dialog box opens.
4. In the Toolbar name box, enter a descriptive name for the toolbar, and click OK.
5. Customize the new toolbar by adding menus or buttons.

Specifying Virtual Package Information

AdminStudio 2019 | Virtual Package Editor

When you open an existing package in the Virtual Package Editor, you may need to view or specify important package information. This includes basic information such as the name of the virtual package and details such as the package GUID and version number. You may also want to see history information such as each date on which the package was saved.

See Also

Configuring Asset Intelligence Information

Viewing History for a Virtual Package

AdminStudio 2019 | Virtual Package Editor

Version • This information applies to App-V 4.x packages.

The Virtual Package Editor shows read-only history information such as the following:

- The date and time when the package was saved
- The GUID of each saved package
- The user name of the person who saved the package
- The name of the machine on which the package was saved
- The version of the Virtual Package Editor that was used to save the package
- The version of App-V that was used when saving the package
- The operating system of the machine on which the package was saved

Each time that you save your file, the Virtual Package Editor adds a new history entry to the History pane and shows such details.
To view history for your virtual package:

1. In the View List under Package Information, click General Information.
2. Review the information in the History pane.

Configuring General Information for a Virtual Package

In the General Information view, you can view and, if appropriate, edit basic information about your virtual package.

To configure general information for your virtual package:

1. In the View List under Package Information, click General Information.
2. In the Settings window, configure the settings as needed. For details about each setting, see General Information View.

Specifying a Virtual Package’s Dependencies

A virtual package may rely on one or more other virtual packages in order to function properly. The Virtual Package Editor lets you specify other App-V packages that the open App-V package (the primary package) requires. This capability, called Dynamic Suite Composition, enables your virtual package to interact with the other virtual applications in the virtual environment. Dynamic Suite Composition enables you to deploy common system components once on each client system, making them available for use by many App-V applications, rather than requiring you to include them with each of the App-V applications that are dependent on them. This reduces redundancy in the local App-V cache and simplifies the construction and testing of the primary App-V application.

If you add a new dependency to your primary package, the Virtual Package Editor automatically associates each of the targets that are defined in the Shortcuts view with that new dependency. Similarly, if you add a new target to your primary package, the Virtual Package Editor automatically associates that target with each dependency that is defined in the Dependencies view. Each .osd file that defines a target contains a list of the other .sft files on which it depends. The Application Virtualization Client may cache this list; therefore, in most cases all of the primary package’s targets should be associated with each dependency.

See Also

Dependencies View
Adding a Dependency to a Virtual Package

---

**Task**

To add a dependency to your virtual package:

1. In the View List under Package Information, click Dependencies.
2. Right-click the Dependencies explorer and then click Add Dependency. The Open dialog box opens.
3. Browse to the .sft or .osd file for the required App-V package, and then click Open.

The Virtual Package Editor adds an .sft item to the Dependencies explorer. The .sft item may contain one or more targets. The targets are defined in the Shortcuts view of the primary package.

When a target with an associated dependency is launched, the Application Virtualization Client loads the dependency’s environment and makes it available as part of the virtual environment of the target’s package.

Configuring a Dependency in a Virtual Package

---

**Task**

To configure a dependency in your virtual package:

1. In the View List under Package Information, click Dependencies.
2. In the Dependencies explorer, click the dependency that you want to configure.
3. In the Settings window, configure the settings as needed. For details about each setting, see Dependencies View.
Chapter 11  Using the Virtual Package Editor

Editing Virtual Packages

Associating a Package’s Targets with a Dependency in a Virtual Package

AdminStudio 2019 | Virtual Package Editor

Version • This information applies to App-V 4.x packages.

It is recommended that all of the targets in your virtual package be associated with each of the package’s dependencies. If you add a new dependency to your primary package, the Virtual Package Editor automatically associates each of the targets that are defined in the Shortcuts view with that new dependency. Similarly, if you add a new target to your primary package, the Virtual Package Editor automatically associates that target with each dependency that is defined in the Dependencies view. If you remove a target from a dependency in the Dependencies view, you may want to add it back.

Task

To associate a target with a dependency in your virtual package:

1. In the View List under Package Information, click Dependencies.

2. In the Dependencies explorer, right-click the .sft file with which you want to associate a target, and then click Associate Target.

   If one or more targets in the package are not associated with the dependency, the Associate Targets with a Dependency dialog box opens. Select the targets that you want to associate with the dependency.

   If all of the targets in the package are associated with the dependency, the Virtual Package Editor displays a message box informing you that all of the package’s targets are already associated with the dependency.

   The Virtual Package Editor adds one or more targets to the dependency if appropriate.

Dependencies View

Specifying Whether a Dependency is Mandatory for a Target in a Virtual Package

AdminStudio 2019 | Virtual Package Editor

Version • This information applies to App-V 4.x packages.

The Virtual Package Editor lets you specify whether a dependency is mandatory in order for target in the primary package (the App-V package that you are editing in the Virtual Package Editor) to run properly. If the dependency is mandatory, the primary package cannot run without loading the required package. For example, a system DLL such as an MFC DLL is likely to be mandatory, but a reference to a document viewer such as Adobe Reader may not be mandatory.

Task

To specify whether a dependency is mandatory for a target in your virtual package:

1. In the View List under Package Information, click Dependencies.

2. In the Dependencies explorer, click the target that you want to configure.

3. In the Settings window, configure the Mandatory setting as needed.
Tip • The Virtual Package Editor lets you configure the settings for more than one target at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.

Dependencies View
Configuring Asset Intelligence Information

Asset intelligence is used to enhance the inventory capabilities of Microsoft System Center 2012 Configuration Manager by extending hardware inventory and adding license management functionality. The System Center 2012 Configuration Manager asset intelligence features can report application data such as digital PID, MSI product codes, and publisher names for each virtual application registered on a client computer.

In App-V 5 packages, asset intelligence information is incorporated into the package itself, with the information being captured during sequencing.

You can view and edit information identifying an App-V 5.0 application on the Asset Intelligence view. Typically these values are read in from the Add/Remove Programs Uninstall registry key.

In the Asset Intelligence view, you can view and, if appropriate, edit intelligence information about your App-V 5.0 virtual package.

### Task

To configure asset intelligence information for your App-V 5.0 virtual package:

1. Open an App-V 5.0 package in Virtual Package Editor.
2. In the View List under Package Information, click Asset Intelligence.
3. In the Settings window, configure the settings as needed. For details about each setting, see Asset Intelligence View.

Organizing Virtual Application Data

The primary objective of a virtual package is to keep the application layer and the operating system layer separate. Each application includes its own configuration information in its virtual environment. As a result, many applications can run side-by-side with other applications on the same computer without any conflicts.

The Virtual Package Editor lets you manage the folders and files that will be available in the virtual environment. It also lets you define registry keys, values, and data for your virtual package. In addition, you can use the Virtual Package Editor to define the targets for your virtual application, and define entry points such as shortcuts for each target. These entry points enable end users to launch an App-V application from within the virtual environment.

- Defining Targets in a Virtual Application
- Creating Shortcuts to the Virtual Application on the Client System
- Using Environment Variables in a Virtual Environment
- Configuring File Extension Associations for the Virtual Application
- Creating Scripts that Run Before or After the App-V Application Is Streamed or Launched
Including Files and Folders

The Virtual Package Editor lets you manage the files and folders that are in your virtual package. This includes the files and folders in the root folder, the virtual file system (VFS) folder, and—if applicable—the SoftGridUserSettings folder. The Virtual Package Editor also lets you extract folders and files from the App-V package file (.appv or .sft) to a location that you specify.

See Also
Files and Folders View

Adding a Predefined Folder to the VFS Folder in an App-V Package

The Virtual Package Editor lets you add various folders that use a constant to the VFS folder. App-V 5 packages use system constants. App-V 4.x packages use CSIDL constants and SFT constants (such as CSIDL_APPDATA and SFT_PROGRAM_FILES_X64). At run time, the folder is mapped to the appropriate location in the virtual environment.

Task
To add a predefined folder to the VFS folder in an App-V package:

1. In the View List under Application Data, click Files and Folders.

2. In the Files and Folders explorer, right-click the VFS folder, point to Add Predefined Folder, and then click the appropriate folder.

The Virtual Package Editor adds the predefined folder to the VFS folder.

See Also
Files and Folders View

Adding a Folder to an App-V Package

The Virtual Package Editor lets you add folders to your virtual package.

Task
To add a folder to an App-V package:

1. In the View List under Application Data, click Files and Folders.

2. Do one of the following:

   - To add an existing folder and all of its contents to the package, in the Files and Folders explorer, right-click the location where you want to add a new folder and click Add Folder. The Browse For Folder dialog box opens, enabling you to select the folder that you want to add.

   - To add a new empty folder to the package, in the Files and Folders explorer, right-click the location where you want to add a new folder and click Add New Folder. The Virtual Package Editor adds a new folder.

The Virtual Package Editor adds the folder to your virtual package.
Tip • To change the name of the new folder, do one of the following:

- In the Files and Folders explorer, click the name of the new folder and then press F2. The Virtual Package Editor highlights the name of the folder, enabling you to edit it as needed.
- In the Files and Folders explorer, right-click the name of the new folder and then click Rename. The Virtual Package Editor highlights the name of the folder, enabling you to edit it as needed.
- Select the new folder, and in the Settings window, change the value of the Name setting.

Files and Folders View

Adding a File to an App-V Package

The Virtual Package Editor lets you add files to your virtual package.

Task To add a file to an App-V package:

1. In the View List under Application Data, click Files and Folders.
2. In the Files and Folders explorer, right-click the location where you want to add a new file and click Add Files. The Select files to add to the virtual package dialog box opens.
3. Select the file that you want to add and then click Open.

Tip • To select multiple files in a folder, hold down the CTRL key while clicking files.

The Virtual Package Editor adds the file or files that you selected to the virtual package.

See Also
Files and Folders View

Configuring a File or Folder in an App-V Package

The Virtual Package Editor lets you configure settings for the files and folders in your virtual package. The settings set information such as file attributes, whether a file is part of feature block 1, and the file or folder data type (application data or user data).

Task To configure the settings for a file or folder in an App-V package:

1. In the View List under Application Data, click Files and Folders.
2. In the Files and Folders explorer, click the file or folder that you want to configure.
3. In the Settings window, configure the settings as needed. For details about each setting, see Files and Folders View.
Tip • The Virtual Package Editor lets you configure the settings for more than one file or folder at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.

Setting the VFS Path for the Contents of a Predefined Folder in an App-V Package

AdminStudio 2019 | Virtual Package Editor

If a file or folder should exist outside the App-V package’s root folder on the virtual file system, the Virtual Package Editor lets you modify the VFS path for that file or folder.

You may want to specify a VFS path if your virtual application tries to access the files in a folder by referring to a system folder to find the files (for example, looking up the Programs File folder) instead of using a relative path. You may also want to specify a VFS path if end users need to be able to find files when using a file browse dialog box (for example, for templates that are stored in a common file folder).

You can modify a folder’s VFS Path setting by changing its Isolation setting. Using the Isolation setting, you can specify whether you want the selected folder in the App-V package to override the corresponding folder on the client system. The available options are:

- **Override**—The App-V application sees only the file content of the folder that is inside the App-V package. For an App-V 5.x package, this setting is inherited by all subfolders. For App-V 4.x packages, selecting this option automatically sets the read-only VFS Path setting.

  Note • Overriding the isolation setting is also referred to as “fully virtualized”

- **Merge**—The App-V application sees a merged view of the file content inside the App-V package and of the file content of the corresponding folder on the physical client system. For App-V 4.x packages, selecting this option automatically clears the VFS Path setting.

To modify the VFS path for the contents of a folder in an App-V package, perform the following steps:

**Task**

To modify the VFS path for the contents of a folder in an App-V package:

1. In the View List under **Application Data**, click **Files and Folders**.

2. In the **Files and Folders** explorer, select the predefined folder that contains the files and folders whose VFS path you want to configure.

3. In the Settings window, set the folder’s Isolation setting to **Override**. For App-V 4.x packages, the VFS Path setting will then be automatically set.

Files and Folders View
Moving a File or Folder in an App-V Package

The Virtual Package Editor lets you move files and folders in your virtual package from one location to another using drag and drop functionality.

Task

To move a file or folder in an App-V package:

1. In the View List under Application Data, click Files and Folders.
2. In the Files and Folders explorer, drag a file or folder that you want to move to the appropriate location.

See Also
Files and Folders View

Extracting Files and Folders from the App-V Package

When you are editing an App-V package in the Virtual Package Editor, you may want to extract one or more files and folders from the package and save them to a local or network location. Doing so enables you to view the physical files that are streamed within the App-V package. If you extract a folder that contains subfolders and files, the Virtual Package Editor uses the same folder structure when saving the folder and its contents.

Task

To extract a file from an App-V package:

1. In the View List under Application Data, click Files and Folders.
2. In the Files and Folders explorer, right-click the file that you want to extract, and then click Extract. The Save As dialog box opens.
3. Browse to the location where you want to save the file.
4. In the File name setting, enter a new name for the file if you want to use a different one.
5. Click the Save button.

The Virtual Package Editor saves the file in the location that you specified.

Task

To extract a folder and its contents from an App-V package:

1. In the View List under Application Data, click Files and Folders.
2. In the Files and Folders explorer, right-click the folder that you want to extract, and then click Extract. The Browse for Folder dialog box opens.
3. Select the folder that you want to contain the extracted folder and its contents.

The Virtual Package Editor saves the folder, its subfolders, and its files in the location that you specified.
Removing a File or Folder in an App-V Package

The Virtual Package Editor lets you remove files and folders from your App-V package. If you remove a folder, all of its contents—including any subfolders and files—are also removed.

**Task**

1. In the View List under *Application Data*, click *Files and Folders*.
2. In the *Files and Folders* explorer, right-click the file or folder that you want to remove, and then click *Remove*.

The Virtual Package Editor removes the file or folder from your virtual package.

See Also

*Files and Folders View*

Editing the Virtual Registry

The Registry view enables you to define registry keys, values, and data for your App-V package. This view also lets you configure isolation options for selected registry keys. Isolation options indicate how the isolation environment provides access to system resources that the application needs: you can choose to override one or more keys on the client system, or you can choose to create a merged view of one or more keys for the virtual environment.

Note that the registry entries that are configured in the Registry view affect only the application in your App-V package. They do not affect any other App-V packages that are streamed to the Application Virtualization Client, and they do not affect any products that are installed to the client system.

**Keys, Value Names, and Value Data**

The registry consists of machine data and user data. A key is a named location in the registry. A key can contain subkeys, a default value, and named values. A default value is a value without a name. All other values associate a name with some data: the value name identifies where to store it, and the value data is the data in that storage.

Note that the terms *key* and *subkey* are relative. In the registry, a key that is below another key can be referred to as a *subkey* or as a *key*, depending on how you want to refer to it relative to another key in the registry hierarchy.

Adding a Registry Key to a Virtual Package

The Virtual Package Editor enables you to add registry keys to your App-V package so that they are available in the virtual environment.
Chapter 11 Using the Virtual Package Editor

Editing Virtual Packages

**Task**

To add a registry key to your virtual package:

1. In the View List under **Application Data**, click **Registry**.

2. Do one of the following:
   - To add machine registry data, expand the **MACHINE** node.
   - To add user registry data, expand the **USER** node. If your App-V package does not contain any user registry data, you may need to add the **USER** node. To do so, right-click the **Registry** explorer, point to **Add Predefined Key**, and click **USER**.

3. In the **Registry** explorer, right-click the registry entry that you want to contain the new key, and then click **Add Key**. The Virtual Package Editor adds a registry key with a default REG_SZ value.

**Tip**

To change the name of the new registry key, do one of the following:

- In the **Registry** explorer, click the name of the new registry key and then press F2. The Virtual Package Editor highlights the name of the key, enabling you to edit it as needed.
- In the **Registry** explorer, right-click the name of the new registry key and then click **Rename**. The Virtual Package Editor highlights the name of the key, enabling you to edit it as needed.
- Select the new registry key, and in the **Settings** window, change the value of the **Name** setting.

**See Also**
Registry View

Configuring a Registry Key in a Virtual Package

If your virtual package includes one or more registry keys, you can configure each key’s settings to specify information such as the value data, as well as whether the key in the App-V package should override the corresponding key on the client system.

**Task**

To configure a registry key in your virtual package:

1. In the View List under **Application Data**, click **Registry**.

2. In the **Registry** explorer, click the registry key that you want to configure.

3. In the **Settings** window, configure the settings for the registry key as needed. For details about each setting, see Registry View.

**Tip**

The Virtual Package Editor lets you configure the settings for more than one registry entry at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.

The **Isolation** setting lets you specify whether you want the selected registry key in the App-V package to either see only the registry content that is inside the App-V package for a key and all its subkeys, or see a merged view of the registry content
inside the App-V package and of the registry content on the physical client system. If you want to change the value of this setting for all of a registry key’s subkey simultaneously, see Configuring the Isolation Setting for All of the Subkeys Under One or More Keys.

See Also
Registry View

Configuring the Isolation Setting for All of the Subkeys Under One or More Keys

If your virtual package includes a registry key that has multiple subkeys whose Isolation setting should be configured with the same value, you can quickly change the value of the Isolation setting for all of that key’s subkeys simultaneously. You can also quickly configure the Isolation setting for all of the subkeys that belong to multiple parent keys.

Task

To configure the Isolation setting for all of the subkeys under one or more keys:

1. In the View List under Application Data, click Registry.
2. In the Registry explorer, click the registry key that you want to configure.

   If you want to configure the Isolation setting for all of the subkeys under multiple parent keys, select all of the applicable parent keys. To select multiple consecutive keys, select the first registry key, press and hold SHIFT, and select the last key. To select multiple nonconsecutive keys, select one key, press and hold CTRL, and select each additional key.

3. Right-click the selected key or keys and then click the appropriate command:
   - **Override Child Keys**—If you want to select Override for the Isolation setting of each subkey under the selected keys, select this option.
     
     The App-V application sees the registry content that is inside the App-V package for this key and all subkeys. Thus, the application does not see any registry content from the physical client system.
   
   - **Merge Child Keys**—If you want to select Merge for the Isolation setting of each subkey under the selected keys, select this option.
     
     The App-V application sees a merged view of the registry content inside the App-V package and of the registry content on the physical client system. If the registry key has subkeys on the physical client system but not in the App-V package, these keys are merged into the registry view that is available to the App-V application. However, registry values that are on the physical client system and that are in registry keys that also exist in the App-V package are not merged into the App-V application’s registry view.

Adding a Target to a Virtual Package

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor enables you to add one or more targets for your App-V package.
Task

To add a target to your virtual package:

1. In the View List under Application Data, click Shortcuts.
2. Right-click the Targets explorer and then click Add Target.

The Virtual Package Editor adds a new target.

Tip • To change the name of the new target, do one of the following:

- In the Targets explorer, click the name of the new target and then press F2. The Virtual Package Editor highlights the name of the target, enabling you to edit it as needed.
- In the Targets explorer, right-click the name of the new target and then click Rename. The Virtual Package Editor highlights the name of the target, enabling you to edit it as needed.
- Select the new target, and in the Settings window, change the value of the Name setting.

Creating Shortcuts to the Virtual Application on the Client System

AdminStudio 2019 | Virtual Package Editor

Shortcuts offer quick access to a virtual application. You can configure your virtual package so that it adds shortcuts for your virtual application on the desktop, the Start menu, and various other locations on the client system.

Each shortcut that you create is part of a target in your virtual package. Each target in your virtual package can contain one or more entry points, such as shortcuts, for each target. At the target level, the Virtual Package Editor enables you to configure information such as the file in your virtual application that you want to launch, the icon that should be used for the target, and the command-line arguments that should be used to launch the file. For a shortcut, the Virtual Package Editor enables you to configure the display name and location of the shortcut.

Adding a Shortcut for a Virtual Package

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor enables you to add to your App-V package a shortcut that points to your App-V application. You can add a shortcut to any target in your App-V package. To learn how to add a new target, see Adding a Target to a Virtual Package.

**Task**

To add a shortcut to a target in your virtual package:

1. In the View List under **Application Data**, click **Shortcuts**.
2. In the **Targets** explorer, under the target that you want to contain the new shortcut, right-click the **Shortcuts** folder, and then click **Add Shortcut**.

The Virtual Package Editor adds the shortcut to the Targets explorer.

**Tip**

To change the display name of the new shortcut, do one of the following:
In the **Targets** explorer, click the name of the new shortcut and then press F2. The Virtual Package Editor highlights the name of the shortcut, enabling you to edit it as needed.

- In the **Targets** explorer, right-click the name of the new shortcut and then click **Rename**. The Virtual Package Editor highlights the name of the shortcut, enabling you to edit it as needed.
- Select the new shortcut, and in the **Settings** window, change the value of the **Display Name** setting.

Using Environment Variables in a Virtual Environment

Environment variables are name and value pairs that can be accessed by your virtual application. Environment variables in a virtual package are stored in the virtual registry.

The Virtual Package Editor enables you to create environment variables that you want to be available to your virtual application in the virtual environment.

Note that the environment variables that are configured in an App-V package affect only the application in your App-V package. They do not affect any other App-V packages that are streamed to the Application Virtualization Client, and they do not affect any products that are installed to the client system.

Setting an Environment Variable in a Virtual Package

The Virtual Package Editor enables you to add to your App-V package one or more environment variables.

Version • The procedure for setting an environment variable varies, depending on the version of the App-V package.

The Virtual Package Editor enables you to add to your App-V package one or more environment variables.

Setting an Environment Variable in an App-V 5 Package

Task • To set an environment variable in your App-V 5 package:

1. In the View List under System Configuration, click Environment Variables.
2. Right-click the Environment Variables explorer, and then click Add Variable.

The Virtual Package Editor adds the environment variable to the Environment Variables explorer.

Tip • To change the name of the new environment variable, do one of the following:

- In the Environment Variables explorer, click the name of the new environment variable and then press F2. The Virtual Package Editor highlights the name of the environment variable, enabling you to edit it as needed.
- In the Environment Variables explorer, right-click the name of the new environment variable and then click Rename. The Virtual Package Editor highlights the name of the environment variable, enabling you to edit it as needed.
- Select the new environment variable, and in the Settings window, change the value of the Name setting.
Setting an Environment Variable in an App-V 4.x Package

The Virtual Package Editor enables you to associate an environment variable with a target in your App-V package. To learn how to add a new target, see Adding a Target to a Virtual Package.

**Task**

*To set an environment variable in your App-V 4.x package:*

1. In the View List under Application Data, click Shortcuts.
2. In the Targets explorer, under the target that you want to be associated with the new environment variable, right-click the Environment Variable folder, and then click Add Variable.

The Virtual Package Editor adds the environment variable to the Targets explorer.

**Tip**

*To change the name of the new environment variable, do one of the following:*

- In the Targets explorer, click the name of the new environment variable and then press F2. The Virtual Package Editor highlights the name of the environment variable, enabling you to edit it as needed.
- In the Targets explorer, right-click the name of the new environment variable and then click Rename. The Virtual Package Editor highlights the name of the environment variable, enabling you to edit it as needed.
- Select the new environment variable, and in the Settings window, change the value of the Name setting.

Configuring File Extension Associations for the Virtual Application

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor enables you to set up file extensions in your virtual package. Once you have added a file extension, you can set up one or more verbs, such as Open or Print, for the file extension. When an end user double-clicks a file with that file extension in the virtual environment, the file opens in your virtual application. If an end user right-clicks a file with that file extension in the virtual environment, the context menu shown by Windows Explorer includes the display names of the verbs that are set up for the file extension.

Adding a File Extension to a Virtual Package

AdminStudio 2019 | Virtual Package Editor

Version • The procedure for adding a file extension varies, depending on the version of the App-V package.

Also note that for App-V 5 packages, the file extension that you enter must include a dot—for example, .txt. However, for App-V 4.x packages, the file extension that you enter should not include a dot—for example, txt.

The Virtual Package Editor enables you to add a file extension to your App-V application.

Adding a File Extension to an App-V 5 Package

Task
To add a file extension to your App-V 5 package:

1. In the View List under Application Data, click File Extensions.
2. Right-click the File Extensions explorer, and then click Add File Extension.

The Virtual Package Editor adds the file extension to the File Extensions explorer.

Tip • To specify the file extension, do one of the following:

- In the File Extensions explorer, click the name of the new file extension and then press F2. The Virtual Package Editor highlights the name of the file extension, enabling you to enter the file extension as needed.
- In the File Extensions explorer, right-click the name of the new file extension and then click Rename. The Virtual Package Editor highlights the name of the file extension, enabling you to enter the file extension as needed.
- Select the new file extension, and in the Settings window, change the value of the Extension setting.

For App-V 5 packages, it is necessary to enter the dot—for example, enter .txt instead of txt.

Adding a File Extension to a Target in an App-V 4.x Package

You can associate a file extension with any target in an App-V 4.x package. To learn how to add a new target, see Adding a Target to a Virtual Package.
Chapter 11   Using the Virtual Package Editor

Editing Virtual Packages

**Task**

To add a file extension to a target in your App-V 4.x package:

1. In the View List under Application Data, click Shortcuts.
2. In the Targets explorer, under the target that you want to contain the new file extension, right-click the File Extensions folder, and then click Add File Extension.

The Virtual Package Editor adds the file extension to the Targets explorer.

**Tip**

To specify the file extension, do one of the following:

- In the Targets explorer, click the name of the new file extension and then press F2. The Virtual Package Editor highlights the name of the file extension, enabling you to enter the file extension as needed.
- In the Targets explorer, right-click the name of the new file extension and then click Rename. The Virtual Package Editor highlights the name of the file extension, enabling you to enter the file extension as needed.
- Select the new file extension, and in the Settings window, change the value of the Extension setting.

It is not necessary to enter the dot—for example, enter txt instead of .txt.

Creating Scripts that Run Before or After the App-V Application Is Streamed or Launched

The Virtual Package Editor lets you add to your App-V package scripts that you want to be run at various stages: before or after the App-V application is streamed to the client, or before or after the App-V application is launched. You can create scripts that make changes that your application requires, either in the App-V environment or on the client system outside the virtual environment. For example, you may want to launch a script that ensures that a particular file or registry entry exists, or that synchronizes data inside the virtual environment with data outside the virtual environment.

Two different types of scripting are available:

• Single command (HREF)—The App-V package references an external script or an executable file. The contents of the script are launched directly on the client system. The Command Prompt window is not displayed unless the process that is being called opens it.
• **Command script (SCRIPTBODY)** — The contents of the script are stored in the App-V package and copied to a temporary .bat file in the root folder (typically under the Q drive) of the App-V package on the client system. The .bat file is launched from a visible Command Prompt window.

You can use either type of scripting to call an executable file that exists in the folder on the virtual application server where the App-V package is stored.

Each script that you create is associated with a target in your virtual package. Each target in your virtual package can contain one or more entry points, such as scripts and shortcuts. At the target level, the Virtual Package Editor enables you to configure information such as the file in your virtual application that you want to launch and the command-line arguments that should be used to launch the file. For a script, the Virtual Package Editor enables you to configure information such as when you want the script to be launched.

### Configuring a Script in a Virtual Package

**AdminStudio 2019 | Virtual Package Editor**

For App-V 4.x packages, you can use Virtual Package Editor to configure script information, such as when you want a script to be launched.

**Edition** • [CHECK THIS] This feature is not available for App-V 5.x packages.
For now we do not have support for creating scripts for App-V 5.x using VPE. But actually, the Sequencer doesn’t have it either. Both tools can be used to add files to the Scripts folder which can be run via script commands. However, after that, manual editing of the dynamic deployment config XML files is required. The bug that was fixed was to include the Scripts folder which can be used for the files needed for a script.

So we could say that in order to create scripts for App-V 5.x packages you have to manually edit the dynamic configuration XML files and then refer to some Microsoft help links. Or we can skip this, and let the user figure it out by googling for it themselves. What do you think?

A MS link:

A non-MS link:
http://app-virtual.blogspot.com/2013/01/writing-script-to-dynamic-configuration.html

**Tip** • To configure information such as the file in your virtual application that you want to be associated with the script, the icon that should be used for the target, and the command-line arguments that should be used to launch the file, configure the settings for the target that contains the shortcut. To learn more, see Configuring a Target in a Virtual Package.

---

**Task**

**To configure a script in your virtual package:**

1. In the View List under Application Data, click Shortcuts.
2. In the Targets explorer, click the script that you want to configure.
3. In the Settings window, configure the settings as needed. For details about each setting, see Scripting Settings.
   To learn how to trigger the appropriate behavior if the script fails, see Causing the App-V Application to Close After a Script Failure.
4. In the Script window, enter your script: either a one-line command or the body of the script.

**Tip** • The Virtual Package Editor lets you configure the settings for more than one script at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.

---

**Guidelines for Entering Script**

Note the following guidelines when you are entering script in the Shortcuts view.

- If you are entering script for the command script (Scriptbody) type of script, you can use any script language that the client operating system supports.
- If you are entering script for the command script (Scriptbody) type of script, you can use command processor commands such as CHDIR and MOVE in your script.

If you are entering script for the single command (HREF) type of script, command processor commands cannot be used, unless you launch cmd.exe to run the script.
• The Virtual Package Editor automatically adds the proper escape sequence for a newline character (\n), if appropriate, to the App-V package that it generates. Thus, to end a line and start a new one, simply press Enter; avoid entering a newline character (\n).

The Virtual Package Editor also automatically adds the backslash character (\) if you enter a backslash, resulting in a double backslash (\\) in the App-V package. Thus, if you are specifying a path, do not use the escape character.

• If you are entering script for the single command (HREF) type of script, ensure that you enter only one line of script. If you enter more than one line, the Virtual Package Editor ignores all of the lines after the first line.

Note that if you are using the command script (Scriptbody) type of script, you can enter more than one line of script.

**Specifying the Application Path for a File in a Virtual Package**

AdminStudio 2019 | Virtual Package Editor

**Version**

This information applies to App-V 5 packages.

An application path is a list of directories for the search path that the system should use to load DLLs and other files for the application. These directories are added to the beginning of the system PATH environment variable.

The Virtual Package Editor enables you to create application paths for your virtual application in the virtual environment.
Note that the application paths that are configured in an App-V package affect only the application in your App-V package. They do not affect any other App-V packages that are streamed to the Application Virtualization Client, and they do not affect any products that are installed to the client system.

To set an environment variable in your virtual package:

1. In the View List under System Configuration, click Application Paths.
2. Right-click the Application Paths explorer, and then click Add App Path.

The Virtual Package Editor adds the application path to the Application Paths explorer.

Tip

To change the name of the new application path, do one of the following:

- In the Application Paths explorer, click the name of the new application path and then press F2. The Virtual Package Editor highlights the name of the application path, enabling you to edit it as needed.
- In the Application Paths explorer, right-click the name of the new application path and then click Rename. The Virtual Package Editor highlights the name of the application path, enabling you to edit it as needed.
- Select the new application path, and in the Settings window, change the value of the Name setting.

Configuring an Application Path in a Virtual Package

Tip

The Virtual Package Editor lets you configure the settings for more than one application path at a time. To learn more, see Configuring the Value of a Setting for More Than One Item at a Time.
Task To configure an application path in your virtual package:

1. In the View List under System Configuration, click Application Paths.
2. In the Application Paths explorer, click the environment variable that you want to set.
3. In the Settings window, configure the settings as needed. For details about each setting, see Application Paths View.

See Also Application Paths View

Removing an Application Path from a Virtual Package

To remove an application path from your virtual package:

1. In the View List under System Configuration, click Application Paths.
2. In the Application Paths explorer, right-click the application path that you want to remove, and then click Remove.

See Also Application Paths View

Configuring Virtual Services

Windows services are executable files that Windows–based systems run in the background to manage various system tasks. A service is an executable file, but it must be designed as a service; you cannot automatically use an arbitrary executable file as a service. Windows services can be configured to run every time that the system starts or on demand when needed. The Virtual Package Editor enables you to configure services that you want to include in your App-V package so that they are available in the virtual environment.

See Also Virtual Services View

Adding a Virtual Service to a Virtual Package

The Virtual Package Editor enables you to add virtual services to your App-V package so that they are available in the virtual environment.
Task

To add a virtual service to your virtual package:

1. In the View List under System Configuration, click Virtual Services.
2. Right-click the Virtual Services explorer and then click Add Virtual Service.

The Virtual Package Editor adds a new service.

Tip

To change the name of the new service, do one of the following:

- In the Targets explorer, click the name of the new service and then press F2. The Virtual Package Editor highlights the name of the service, enabling you to edit it as needed.
- In the Targets explorer, right-click the name of the new service and then click Rename. The Virtual Package Editor highlights the name of the service, enabling you to edit it as needed.
- Select the new service, and in the Settings window, change the value of the Display Name setting.

Configuring a Virtual Service in a Virtual Package

AdminStudio 2019 | Virtual Package Editor

If your virtual package includes one or more virtual services, you can configure each service’s settings to specify information such as the service name, the path to the executable file, and the type of service.

Task

To configure a virtual service in your virtual package:

1. In the View List under System Configuration, click Virtual Services.
2. In the Virtual Services explorer, click the service that you want to configure.
3. Configure the settings for the virtual service as needed. For details about each setting, see Virtual Services View.

Removing a Virtual Service from a Virtual Package

AdminStudio 2019 | Virtual Package Editor

Task

To remove a virtual service from your virtual package:

1. In the View List under System Configuration, click Virtual Services.
2. In the Virtual Services explorer, right-click the service that you want to remove, and then click Remove.

The Virtual Package Editor removes the service from your virtual package.

Testing and Troubleshooting Virtual Packages

AdminStudio 2019 | Virtual Package Editor

Once you have made the necessary changes for the files, folders, shortcuts, services, and other elements of your virtual package, you are ready to test the package. The Virtual Package Editor lets you optionally include the AdminStudio App-V Application Launcher with your App-V package if you want to test a newly saved App-V package locally before moving it to a deployment server.

Application Manager Analyze includes several Application Conflict Evaluators (ACEs) that may help you identify potential conflicts between different App-V packages, and between App-V packages and Windows Installer–based installations. Part of your testing strategy may involve using Analyze to detect potential conflicts.

If you encounter issues when running the App-V package, you can add to the package shortcuts that launch the Command Prompt window and the registry editor. These types of shortcuts may help you debug problems with an App-V package, since they enable you to examine the file system and view the registry while the virtual application is running in the virtual environment.

Using Debug Tools with a Virtual Package
Using the Virtual Package Editor to Resolve Application Conflict Evaluators (ACEs) in App-V Packages

Using the App-V Application Launcher to Test the Virtual Package

AdminStudio 2019 | Virtual Package Editor

You can use the AdminStudio App-V Application Launcher to test a newly saved App-V package on a test machine before moving it to a deployment server.

If you want the Virtual Package Editor to include the App-V Application Launcher whenever you save the App-V package, enable the App-V Launcher save option. To learn more, see Saving a Virtual Package.

Requirements for Using the App-V Application Launcher

The machine on which you use the App-V Application Launcher to test an App-V package must meet the following requirements:

- The Microsoft Application Virtualization Client must be installed.
- The version of the Microsoft Application Virtualization Client that is present should be equal to or newer than the minimum client version of the App-V package. The Virtual Package Editor displays the minimum client version of the App-V package in the General Information view.
- File streaming must be enabled because the App-V Application Launcher publishes the App-V package from a local file path. If file streaming is not enabled, the App-V Application Launcher displays an informative message asking if it can enable this functionality.

Starting the App-V Application Launcher

When you save an App-V package in the Virtual Package Editor and the App-V Launcher save option is enabled, the Virtual Package Editor adds the App-V Application Launcher (AppVLauncher.exe) to the same folder as the App-V package every time that you save an App-V package.
To use the App-V Application Launcher for testing a virtual package:

1. In the Virtual Package Editor, open the App-V package that you want to test.

2. Do one of the following:
   - On the View menu, click Show in Explorer.
   - Press CTRL+E.
   - On the toolbar, click the Explore button.

   A Windows Explorer window opens. It shows the folder that contains the .appv or .sft file, the .xml files, the AppVLauncher.exe file, possibly one or more .osd files, possibly a Registry.dat file, and possibly an icon folder.

   If you have saved the App-V package as a new version one or more times, the folder may also contain a subfolder for each earlier version. The subfolders are named bkup_\(N\), where \(N\) represents the version number of the App-V package.

3. Copy the contents of the folder (except for the bkup_\(N\) folders) to a test machine that meets the aforementioned App-V Application Launcher requirements. The AppVLauncher.exe file should be in the same folder as the .appv or .sft file.

   If the App-V package has one target defined in the Shortcuts view (that is, if the App-V package has only one .osd file), the App-V Application Launcher starts the App-V application.

   If the App-V package has more than one target defined in the Shortcuts view (that is, if the App-V package has two or more .osd files), the App-V Application Launcher displays a dialog box that lists each target, and it lets you select the one that you want to launch.

Note • The first time that you use the App-V Application Launcher to run an application in an App-V package, the entire package is published to that machine; this includes all of the package's shortcuts and file extension associations in the package. If you then use the App-V Application Launcher to run any application in the App-V package again, the App-V Application Launcher unpublishes the package (and its shortcuts and file extension associations) before republishing the package.

Also note that the AppVLauncher.exe file requires elevation. If you want to be able to test your App-V package in a locked-down environment where end users will not have elevated privileges, you may want to use the App-V Application Launcher once to launch and publish your App-V package with elevated privileges. Once you have done that, you can use the published shortcuts and file extension associations to start your application.

Components of an App-V Package
Closing a Virtual Package

Using Debug Tools with a Virtual Package

The Virtual Package Editor lets you incorporate the following tools in a virtual package:

- Cmd.exe (x86)—The 32-bit version of Cmd.exe on the local machine runs, and it has access to the virtual environment.
Chapter 11  Using the Virtual Package Editor
Editing Virtual Packages

- **Cmd.exe (x64)**—The 64-bit version of Cmd.exe on the local machine runs, and it has access to the virtual environment. This requires Microsoft Application Virtualization Client 4.6 or later, and it also require that the App-V package be published in a 64-bit environment.

- **Regedit.exe**—Regedit.exe on the local machine runs, and it has access to the virtual environment.

These debug tools may help you troubleshoot issues in the virtual package.

**Important** • It is recommended that you use the debug tools only for testing. Before you release your virtual package, remove these tools from the package.

### Task

**To add a debug tool to your virtual package:**

1. In the View List under Application Data, click Shortcuts.
2. Right-click the Targets explorer, point to Add Debug Tool, and then point to the appropriate command:
   - Cmd.exe (x86)
   - Cmd.exe (x64)
   - Regedit.exe

The Virtual Package Editor adds the debug tool to the Targets explorer. The debug tool includes a shortcut that you can use to launch the tool in the virtual environment.

Adding a debug tool to a virtual package is similar to adding a target. Therefore, if appropriate, you can perform other tasks for the debug tool, just as you can for a target. For example, if you want to launch a script whenever you launch the Command Prompt window to simulate run-time behavior, you can add a script to the debug tool.

### Task

**To remove a debug tool from your virtual package:**

1. In the View List under Application Data, click Shortcuts.
2. In the Targets explorer, right-click the debug tool that you want to remove, and then click Remove.

Using the Virtual Package Editor to Resolve Application Conflict Evaluators (ACEs) in App-V Packages

AdminStudio 2019 | Virtual Package Editor

**Version** • Some ACEs apply to particular versions of App-V packages. Version-specific differences are noted where appropriate.
You can use Application Manager to run Application Conflict Evaluators (ACEs) and identify potential conflicts between different App-V packages, and between App-V packages and Windows Installer packages. The following table lists ACE tests that pertain to App-V packages, as well as troubleshooting tips for resolving the issues through the Virtual Package Editor.

**Table 11-7 • Troubleshooting Tips for Resolving ACE Issues in App-V Packages**

<table>
<thead>
<tr>
<th>ACE Test</th>
<th>Test Group/Test Category</th>
<th>Description</th>
</tr>
</thead>
</table>
| ACE200  | Inter-Application Conflicts/Microsoft App-V Conflict Tests | This ACE indicates that two or more packages contain a shortcut with the same display name and location. To resolve this issue in an App-V package, use the Shortcuts view to do one of the following:  
  - Select the shortcut, and then modify the value in the Display Name setting or the Location setting.  
  - **Remove the shortcut** from the App-V package. |
| ACE201  | Virtualization and Windows Installer Best Practices/Microsoft App-V Best Practices | This ACE indicates that a target in the package has a hard-coded path such as C:\...\, which may not be present in a virtual environment. To resolve this issue in an App-V package, change the path of the target to use a variable instead of a hard-coded path:  
  1. In the View List under **Application Data**, click **Shortcuts**.  
  2. In the **Targets** explorer, select the target that contains the hard-coded path.  
  3. In the **Target** setting, replace the existing path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64—instead of the hard-coded path. Note that if there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter. |
| ACE202  | Virtualization and Windows Installer Best Practices/Microsoft App-V Best Practices | This ACE indicates that the command-line arguments for a target in the package include a hard-coded path such as C:\...\, which may not be present in a virtual environment. To resolve this issue in an App-V package, change the path to use a variable instead of a hard-coded path:  
  1. In the View List under **Application Data**, click **Shortcuts**.  
  2. In the **Targets** explorer, select the target that contains the hard-coded path.  
  3. In the **Arguments** setting, replace the existing path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64—instead of the hard-coded path. Note that if there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter. |
This ACE indicates that the working directory for a target in the package include a hard-coded path such as C:\..., which may not be present in a virtual environment.

To resolve this issue in an App-V package, change the path to use a variable instead of a hard-coded path:

1. In the View List under Application Data, click Shortcuts.
2. In the Targets explorer, select the target that contains the hard-coded path.
3. In the Working Directory setting, replace the existing path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64—instead of the hard-coded path.

Note that if there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter.

This ACE indicates that two or more packages have the same package GUID; therefore, the two packages cannot be deployed simultaneously as separate packages.

If you are editing an update package that can upgrade earlier versions of the virtual package, the package GUID should stay the same.

If you are editing a new package that can be deployed simultaneously as another package, the package GUID in one of the packages must be changed. To change the package GUID, save the package as a new package. To learn more, see Saving a Virtual Package.

This ACE indicates that two or more packages have the same name. This is not advisable from a best practice perspective, and it may cause some issues if you try to simultaneously deploy the App-V packages.

To resolve this issue:

1. In the View List under Package Information, click General Information.
2. In the Name setting, replace the duplicate name with a unique name.
**Table 11-7 • Troubleshooting Tips for Resolving ACE Issues in App-V Packages (cont.)**

<table>
<thead>
<tr>
<th>ACE Test</th>
<th>Test Group/Test Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE206</td>
<td>Inter-Application Conflicts/Microsoft App-V Conflict Tests</td>
<td>This ACE indicates that two or more packages have support for the same file extension. However, a file extension can be registered with only one application at a time. To resolve this issue, you may need to decide which package should contain the file extension association and which should not. Then you can use the Virtual Package Editor to remove the appropriate file extension.</td>
</tr>
</tbody>
</table>

---

ACE207 | Inter-Application Conflicts/Microsoft App-V Conflict Tests | This ACE indicates that two or more packages have the same long or short name for the root folder. These names must be unique because two packages with the same root folder name cannot be deployed simultaneously. To resolve this issue:  
1. In the View List under Package Information, click General Information.  
2. In the Root Folder Name setting, replace the duplicate folder name with a unique folder name.  

Note • This ACE applies to App-V 4.x packages.  

This ACE indicates that two or more packages have the same long or short name for the root folder. These names must be unique because two packages with the same root folder name cannot be deployed simultaneously. To resolve this issue:

1. In the View List under Package Information, click General Information.  
2. In the Root Folder Name setting, replace the duplicate folder name with a unique folder name.

Note that instances of the old package’s root folder name may still exist in location-related configuration data, such as in registry entries, .ini files, or XML files in the App-V package. The root folder name is not updated in those areas automatically if you change the root folder name in the General Information view.

Therefore, if you know that the old package contains configuration data, you may need to identify where it is. Then you can use the Virtual Package Editor to update the root folder name as necessary. For example, you may want to use the Virtual Package Editor to extract a configuration file from the package. Next, you can update the root folder name in the file. In the Virtual Package Editor, you would then delete the old file from the App-V package, and add the updated file.
### Table 11-7 • Troubleshooting Tips for Resolving ACE Issues in App-V Packages (cont.)

<table>
<thead>
<tr>
<th>ACE Test</th>
<th>Test Group/Test Category</th>
<th>Description</th>
</tr>
</thead>
</table>
| ACE208   | Virtualization and Windows Installer Best Practices/Microsoft App-V Best Practices | This ACE indicates that an App-V package does not contain any shortcuts. You can ignore this ACE if one of the following is true:  
- This package is intended to be used as a dependency by a different App-V package through Dynamic Suite Composition. In this case, you need to edit the other App-V package and select this App-V package as a dependency in the Dependencies view.  
- This package is intended to be used as a plug-in. In this case, you need to create a shortcut to the application for which this is a plug-in. Some common examples include Office and Internet Explorer. If end users need to be able to launch this App-V package independently, consider adding a target to the App-V package if necessary, and then adding a shortcut to the target. |
| ACE215   | Inter-Application Conflicts/Microsoft App-V Conflict Tests | This ACE indicates that the App-V package contains a shortcut (App-V application) that uses the same name and version as one in another package. The combination of the name and version should be unique for shortcuts in different packages, since only one application is published and available at any given time. To resolve this issue in an App-V package, use the Shortcuts view to do one of the following:  
- Select the target that contains the shortcut, and then modify the value in the Name setting or the Target Version setting.  
- Remove the shortcut from the App-V package. |
| ACE216   | Virtualization and Windows Installer Best Practices/Microsoft App-V Best Practices | **Note** • *This ACE applies to App-V 4.x packages.* This ACE checks whether an App-V package's file name contains more than 56 characters. To resolve this issue in an App-V package, rename the .sft file with a name that contains fewer than 56 characters. |
| ACE217   | Virtualization and Windows Installer Best Practices/Microsoft App-V Best Practices | This ACE checks whether the App-V package contains a WMI Provider component. If the WMI Provider is not an important part of the application, or if it can be separately installed from the App-V package, this issue can be suppressed and ignored. |

<td>Virtual Package Editor Menu, Toolbar, and Window Reference</td>
<td>Describes various components of the Virtual Package Editor user interface, including menus, toolbars, and windows.</td>
</tr>
<tr>
<td>Virtual Package Editor Dialog Box Reference</td>
<td>Contains reference information on each of the dialog boxes that are displayed in the Virtual Package Editor.</td>
</tr>
<tr>
<td>Virtual Package Editor View Reference</td>
<td>Describes each of the views that are displayed in the Virtual Package Editor.</td>
</tr>
</tbody>
</table>
Virtual Package Editor Start Page

The Virtual Package Editor Start Page is a tab that provides quick access to product information, to recently opened projects, and to Virtual Package Editor resources. The Start Page includes the following sections:

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package Tasks</td>
<td>Click a package task to quickly open an existing virtual package.</td>
</tr>
<tr>
<td>Help Topics</td>
<td>Frequently accessed help topics are listed in this section. To access the entire Virtual Package Editor Help Library from anywhere within the Virtual Package Editor, you can press F1, click the Help button, or click one of the appropriate commands on the Help menu.</td>
</tr>
<tr>
<td>Recent Packages</td>
<td>The section in the middle of the Start Page lists your most recently accessed virtual packages, their locations, and the dates on which they were last modified.</td>
</tr>
<tr>
<td>Resources</td>
<td>The Resources section contains links to connect you to helpful product information.</td>
</tr>
</tbody>
</table>

Virtual Package Editor Menu, Toolbar, and Window Reference

This section describes the various components of the Virtual Package Editor user interface, including menus, toolbars, and windows.

Menus in the Virtual Package Editor

The menus in the Virtual Package Editor are located on the menu bar, which is at the top of the Virtual Package Editor interface. Each menu contains a list of commands. Some of these commands have icons next to them so that you can quickly associate the command with the icon.

Each of the menus in the Virtual Package Editor is described in this section:

- File
- Edit
- View
- Window
- Help
### File Menu in the Virtual Package Editor

The following table lists the File menu commands, as well as associated keyboard shortcuts and icons.

Chapter 11  Using the Virtual Package Editor

Virtual Package Editor Reference

Script Window

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor displays a Script window when you select a script in the Shortcuts view. Use the Script window to enter the script that you want to be run at various stages: before or after the App-V application is streamed to the client, or before or after the App-V application is launched.

To learn how to configure a script’s settings and enter your script in the Script window, see Configuring a Script in a Virtual Package.

Output Window

AdminStudio 2019 | Virtual Package Editor

The Output window displays task-specific information such as details about the virtual package that you are opening. It also shows save information.

Note that closing the Output window clears its contents. The Virtual Package Editor automatically shows the Output window whenever a task—such as saving or opening a virtual package—generates output.

Virtual Package Editor Dialog Box Reference

This section of the documentation describes dialog boxes that are displayed in the Virtual Package Editor.

- Browse for Folder
- Edit Value
- Save As
- Select a File
- Select a Folder
- Select Files to Add to the Virtual Package

Browse for Folder Dialog Box

The Virtual Package Editor displays the Browse for Folder dialog box when you click the Browse Your Computer button in settings such as the Working Directory setting for the target that is selected in the Shortcuts view. The Browse for Folder dialog box lets you select an existing folder on your machine or create a new folder.

The Browse for Folder dialog box is also displayed when you right-click an item in the Files and Folders view and then click Add Folder. In this case, the Browse for Folder dialog box lets you select a local or network folder that you want to add to your virtual package.

Edit Value Dialog Box

The Virtual Package Editor displays the Edit Value dialog box in the following scenarios:

- You click the ellipsis button (...) in the Value Data setting for a registry value in the Registry view. The ellipsis button is displayed in this setting for a value type of REG_BINARY or REG_MULTI_SZ. Use the Edit Value dialog box to specify the value data.

- You click the ellipsis button (...) in the Group Dependencies setting or the Service Dependencies setting for a service in the Virtual Services view. Use the Edit Value dialog box to specify the groups or services that are required by the virtual service in your virtual package.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value Name</td>
<td>This read-only setting shows the name of the value that you are editing.</td>
</tr>
<tr>
<td>Value Data</td>
<td>Enter the value data (the registry value data, the group dependencies, or the service dependencies). Specify each value on a separate line.</td>
</tr>
</tbody>
</table>

Save As Dialog Box

AdminStudio 2019 | Virtual Package Editor

The Save As dialog box lets you specify the name and location where you want to save your virtual package. This dialog box lets you specify whether you want to save the current virtual package as an update package or as a new package.

Task

To access the Save As dialog box:

On the File menu, click Save As.

Table 11-18 • Save As Dialog Box Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Package</td>
<td>Enter the path and file name that you want to use for the package file. As an alternative, you can click the ellipsis button (...) to browse to the file.</td>
</tr>
<tr>
<td>Save an update package</td>
<td>To save the virtual package as an update package that can upgrade earlier versions of the virtual application, click this option.</td>
</tr>
<tr>
<td>Save as a new package</td>
<td>To save the virtual package as a new package that you can deploy alongside earlier versions of the virtual package in the same virtual environment, click this option.</td>
</tr>
</tbody>
</table>

Saving a Virtual Package

Select a File Dialog Box

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor displays the Select a File dialog box when you click the Browse This Package button in settings such as the Target setting and the Icon setting for a target in the Shortcuts view. The Select a File dialog box displays the directory tree for your virtual package, enabling you to select the appropriate file.

Select a Folder Dialog Box

AdminStudio 2019 | Virtual Package Editor

The Virtual Package Editor displays the Select a Folder dialog box when you click the Browse This Package button in settings such as the Working Directory setting for a target in the Shortcuts view. The Select a Folder dialog box displays the directory tree for your virtual package, enabling you to select the appropriate folder that you want to use as the working directory for the selected target.
See Also
Configuring a Target in a Virtual Package

Select Files to Add to the Virtual Package Dialog Box

The Virtual Package Editor displays the Select Files to Add to the Virtual Package dialog box when you right-click a folder in the Files and Folders view and then click Add Files. The dialog box lets you select local or network files that you want to add to your virtual package.

Virtual Package Editor View Reference

The View List in the left pane is a navigational element that consists of folders and subnodes that you can click to open various areas within the Virtual Package Editor. Each folder and subnode in the View List represents a view within the Virtual Package Editor. The Virtual Package Editor View Reference section describes each of the subnode views.

- Application Paths View
- Asset Intelligence View
- Dependencies View
- Environment Variables View
- File Extensions View
- Files and Folders View
- General Information View
- Registry View
- Shortcuts View
- Virtual Services View

Application Paths View

Version • The Application Paths view is available for App-V 5 packages.
When you select an application path variable in the Application Paths view, the following settings are available.

**Table 11-19 • Settings in the Application Paths View**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the executable file for which you want to create an application path.</td>
</tr>
<tr>
<td>Executable Path</td>
<td>Enter the path and file name of the executable file for which you want to create an application path.</td>
</tr>
<tr>
<td>Path Prefix</td>
<td>Enter a semicolon-delimited list of fully qualified directories for the search path that the system should use to load DLLs and other files for the application. These directories are added to the beginning of the system PATH environment variable.</td>
</tr>
</tbody>
</table>

**Asset Intelligence View**

Asset intelligence is used to enhance the inventory capabilities of Microsoft System Center 2012 Configuration Manager by extending hardware inventory and adding license management functionality. The System Center 2012 Configuration Manager asset intelligence features can report application data such as digital PID, MSI product codes, and publisher names for each virtual application registered on a client computer.

In App-V 5 packages, asset intelligence information is incorporated into the package itself, with the information being captured during sequencing.

You can view and modify Asset Intelligence properties of an App-V 5.0 package by selecting **Asset Intelligence** under **Package Information** in the Virtual Package Editor tree, and then selecting an Asset Intelligence entry in the pane on the right.

The following settings are available on this view.

**Table 11-20 • App-V Package Settings in the Asset Intelligence View**

<table>

<td>This may be the UpgradeCode of the Windows Installer package used to originally install this application.</td>
</tr>
<tr>
<td>OS Component</td>
<td>App-V 5.0</td>
<td>Numeric value that indicates whether the application is part of the operating system:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0—Application is not part of the operating system.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1—Application is part of the operating system.</td>
</tr>
</tbody>
</table>
Dependencies View

AdminStudio 2019 | Virtual Package Editor

Version • The Dependencies view is available for App-V 4.x packages.

The Dependencies view is where you specify other App-V packages that the open App-V package requires.

Icons in the Dependencies View

The Dependencies explorer in the Dependencies view uses different icons to help you distinguish between different types of items. Following is a list of the possible icons in the Dependencies view.

Table 11-21 • Icons in the Dependencies View

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Root Node Icon" /></td>
<td>This icon identifies the root node—the Dependencies explorer.</td>
</tr>
<tr>
<td><img src="image" alt="App-V Package Icon" /></td>
<td>This icon identifies an App-V package (.sft) that the open App-V package (the primary App-V package) requires.</td>
</tr>
<tr>
<td><img src="image" alt="Target Icon" /></td>
<td>This icon identifies a target in the primary App-V package. It is recommended that all of the targets in your virtual package be associated with each of the package's dependencies.</td>
</tr>
</tbody>
</table>

Settings in the Dependencies View

The settings that are displayed in the Dependencies view differ, depending on whether you select an App-V package (.sft file) or a target in this view:

- .sft Settings
- Target Settings

.sft Settings

When you select an .sft file in the Dependencies view, the following settings are available.

Table 11-22 • .sft Settings in the Dependencies View

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This read-only setting shows the name of the required .sft file.</td>
</tr>
</tbody>
</table>

Environment Variables View

AdminStudio 2019 | Virtual Package Editor

Version • The Environment Variables view is available for App-V 5 packages. The environment variable settings are also available when you select an environment variable in the Shortcuts view for App-V 4.x packages.
When you select an environment variable, the following settings are available.

**Table 11-24 • Environment Variable Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the environment variable that you want to configure for the virtual application.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the path or value for this environment variable. To enter multiple paths, separate the paths with a semicolon (;).</td>
</tr>
</tbody>
</table>

**See Also**
- Using Environment Variables in a Virtual Environment

- Shortcuts View

## File Extensions View

**AdminStudio 2019 | Virtual Package Editor**

*Version* • The File Extensions view is available for App-V 5 packages. The file extension settings are also available when you select a file extension in the Shortcuts view for App-V 4.x packages.

The File Extensions view (for an App-V 5 package) and the Shortcuts view (for an App-V 4.x package) enable you to associate a file extension with an application file.

### Icons for File Extensions

The File Extensions explorer in the File Extensions view (for an App-V 5 package) and the Shortcuts view (for an App-V 4.x package) uses different icons to help you distinguish between different types of items. Following is a list of the possible icons.

**Table 11-25 • Icons for File Extensions**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>This icon identifies a file extension.</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>This icon identifies a verb for a file extension.</td>
</tr>
</tbody>
</table>

**See Also**
- Configuring File Extension Associations for the Virtual Application
- Adding a Verb to a File Extension in a Virtual Package
File Extension Settings

AdminStudio 2019 | Virtual Package Editor

When you select a file extension in the File Extensions view (for an App-V 5 package) or the Shortcuts view (for an App-V 4.x package), the following settings are available.

**Table 11-26 • File Extension Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Extension</strong></td>
<td>To associate a file extension with the App-V application, enter the extension.</td>
</tr>
<tr>
<td><strong>Version</strong></td>
<td>For App-V 5 packages, the file extension that you enter must include a dot—for example, .txt. However, for App-V 4.x packages, the file extension that you enter should not include a dot—for example, txt.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter the description text that you want to display for this file extension in the Application Virtualization Client.</td>
</tr>
<tr>
<td><strong>MIME</strong></td>
<td>Enter the MIME type that is associated with the file extension.</td>
</tr>
</tbody>
</table>
| **ProgId** | Enter the program identifier—ProgId, also known as application identifier or tag name—that you want to associate with the file extension. A file type’s ProgId is an arbitrary string, but it should be unique on the client system. One ProgId naming convention is to append the word file to your extension without a dot—the .ext extension might use the ProgId extfile. Another convention is to name a file-type ProgId after the application that is used to open the file type, as in SampleApp.Document.

For example, an .xyz file extension could point to an xyzfile ProgId, and all of the .xyz file-type information would be registered under xyzfile. |
| **Icon** | Enter the path to the icon file (.ico, .exe, or .dll) that contains the icon resource for the file extension. The location can be in the App-V package, or on your computer or the network. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to browse to the icon.

If the icon file that you specify contains more than one icon resource, after the icon path, add a comma and then the index number. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon. To specify the third icon in the icon file, enter the following after the icon file path:

, 2 |
| **Perceived Type** | Select the appropriate type of file. |
Verb Settings for a File Extension

The settings that are displayed when you select a verb under a file extension in the File Extensions view (for an App-V 5 package) or the Shortcuts view (for an App-V 4.x package) are organized into the following main categories:

- General
- Dynamic Data Exchange

General Settings

Use the General area for a verb to specify details such as the name and description of the verb.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Exe Version</td>
<td>Specify the path to the .exe file for which you are creating a verb for the file extension association.</td>
</tr>
</tbody>
</table>

See Also

- Configuring File Extension Associations for the Virtual Application
- Adding a Verb to a File Extension in a Virtual Package
- File Extensions View

Table 11-27 • General Settings for a Verb Under a File Extension
Table 11-27 • General Settings for a Verb Under a File Extension (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the verb, such as Open or Print, that you want to be used when an end user right-clicks a file with the selected extension and then clicks the corresponding command. To include an underlined letter that indicates that end users can click the letter to select the command, precede that letter with an ampersand (&amp;). For example, to display Open (with an underlined letter O) on the context menu for this file extension, enter the following: &amp;Open.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Enter the text that you want to display for this verb on the context menu that Windows Explorer displays when an end user right-clicks a file with the associated file extension. To include an underlined letter that indicates that end users can click the letter to select the command, precede that letter with an ampersand (&amp;). For example, to display Open with SampleApp (with an underlined letter O) on the context menu for this file extension, enter &amp;Open with SampleApp. This setting is optional. If you do not specify a display name, the name of the verb as it appears in the Name setting is used on the context menu for a file with this file extension on the client system. Note that if you use one of the canonical verbs—such as open, print, or find—and you do not specify a display name, Windows automatically localizes the verb on each system.</td>
</tr>
<tr>
<td>Arguments</td>
<td>Enter the command-line arguments for the verb. Note • Verify that the syntax is correct because the Virtual Package Editor does not do this. Tip • Use %1 in the argument in place of the file name. For example, if -p %1 is the argument for the verb, and the end user right-clicks the file C:\File.ext and then clicks the command for this verb, the command-line argument becomes -p C:\File.ext. In some cases, it is necessary to enclose the %1 argument in quotation marks—as in &quot;%1&quot;—to correctly handle file names that contain spaces.</td>
</tr>
</tbody>
</table>
**Dynamic Data Exchange Settings**

If your App-V application supports dynamic data exchange (DDE), use the Dynamic Data Exchange area for a verb to specify DDE settings for the verb.

**Table 11-28 • Dynamic Data Exchange Settings for a Verb Under a File Extension**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DDE Command</td>
<td>Enter the DDE command for the verb.</td>
</tr>
<tr>
<td>DDE Ifexec</td>
<td>Enter the DDE command that you want to use if the DDE conversation cannot be initiated.</td>
</tr>
<tr>
<td>DDE Application</td>
<td>Enter the application name that you want use to establish the DDE conversation. If you leave this setting blank, the DDE Command setting is used as the application name.</td>
</tr>
<tr>
<td>DDE Topic</td>
<td>Enter the name that you want to use as the topic name of the DDE conversation. If you leave this setting blank, System is used as the topic name.</td>
</tr>
</tbody>
</table>

**Note** • Verify that the syntax is correct because the Virtual Package Editor does not do this.

**Tip** • Use %1 in the argument in place of the file name. In some cases, it is necessary to enclose the %1 argument in quotation marks—as in “%1”—to correctly handle file names that contain spaces.

**See Also**

Shortcuts View
Adding a Verb to a File Extension in a Virtual Package
Configuring File Extension Associations for the Virtual Application

**Files and Folders View**

The Files and Folders view is where you specify the files and folders that are in the App-V package. This includes folders and files that are in the App-V package’s root folder, the virtual file system (VFS) folder, and the SoftGridUserSettings folder. This view also lets you extract folders and files from the App-V package file (.sft) to a location that you specify.
Icons in the Files and Folders View

The Files and Folders view uses different icons to help you distinguish between different types of files and folders. Following is a list of the possible icons in the Files and Folders view.

Table 11-29 • Icons in the Files and Folders View

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Folder Icon" /></td>
<td>This icon identifies a folder.</td>
</tr>
<tr>
<td><img src="image" alt="Folder Icon with Overlay" /></td>
<td>This icon identifies that the folder’s Isolation setting is set to Override. This means that the App-V application sees only the file content of the folder that is inside the App-V package. For an App-V 5.x package, this setting is inherited by all subfolders. If this folder’s Isolation property was set to Merge instead, the App-V application would see a merged view of the file content inside the App-V package and of the file content of the corresponding folder on the physical client system, and no overlay icon would appear on top of the folder icon.</td>
</tr>
<tr>
<td><img src="image" alt="File Icon" /></td>
<td>This icon identifies a file.</td>
</tr>
<tr>
<td><img src="image" alt="Font File Icon" /></td>
<td>This icon identifies a font file.</td>
</tr>
</tbody>
</table>

Settings in the Files and Folders View

When you select a file or folder in the Files and Folders view, the following settings are available.

Table 11-30 • File and Folder Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the file or folder in the App-V package.</td>
</tr>
<tr>
<td>Short File Name</td>
<td>Enter the name of the file or folder using the 8.3 format.</td>
</tr>
<tr>
<td>Path</td>
<td>This read-only setting shows the location of the file or folder in the App-V package.</td>
</tr>
</tbody>
</table>
Table 11-30 • File and Folder Settings (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Isolation</strong></td>
<td>Specify whether you want the selected folder in the App-V package to override the corresponding folder on the client system. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Override</strong>—The App-V application sees only the file content of the folder that is inside the App-V package. For an App-V 5.x package, this setting is inherited by all subfolders. Overriding the isolation setting is also referred to as “Fully Virtualized”.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Merge</strong>—The App-V application sees a merged view of the file content inside the App-V package and of the file content of the corresponding folder on the physical client system.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This setting applies only to folders and not to files.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • For App-V 4.x packages, setting this option to <strong>Override</strong> automatically sets the read-only VFS Path setting, and setting this option to <strong>Merge</strong> automatically clears the VFS Path setting.</td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>This read-only setting shows the size of the file.</td>
</tr>
<tr>
<td></td>
<td>This setting applies to files; it does not apply to folders.</td>
</tr>
<tr>
<td><strong>Attributes</strong></td>
<td>To set various attributes for the selected file or folder, use the following settings:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Read-Only</strong>—Specify whether the file is read-only—protected from being changed or accidentally deleted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Hidden</strong>—Specify whether the file or folder is visible in directory listings when default folder viewing options are enabled.</td>
</tr>
<tr>
<td></td>
<td>• <strong>System</strong>—Specify whether the file or folder is a system file or folder that the operating system uses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Archive</strong>—Specify whether the file or folder should be archived. Some applications use this attribute to determine whether to back up a file or folder.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Normal</strong>—Specify whether the file should have its other attributes configured. Selecting True for this setting is valid only if False is selected for the other True-False attributes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Not Content-Indexed</strong>—Specify whether you want to avoid indexing the contents of the file or folder for faster searching.</td>
</tr>
<tr>
<td><strong>Created</strong></td>
<td>This read-only setting shows the date and time when the file or folder was created.</td>
</tr>
<tr>
<td><strong>Modified</strong></td>
<td>This read-only setting shows the date and time when the file or folder was last modified.</td>
</tr>
</tbody>
</table>
Table 11-30 • File and Folder Settings (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Path</td>
<td>If the file has not yet been saved as part of the App-V package, this read-only setting shows the fully qualified path of the source file. This setting applies to files; it does not apply to folders.</td>
</tr>
<tr>
<td>Register Font</td>
<td>Specify whether you want the font to be registered in the virtual environment.</td>
</tr>
<tr>
<td>Feature Block 1</td>
<td>Specify whether the file is part of the primary feature block, the part of the App-V package that is required to start the application. This setting applies to files; it does not apply to folders.</td>
</tr>
<tr>
<td>GUID</td>
<td>This read-only setting shows the globally unique identifier (GUID) that is associated with the file or folder.</td>
</tr>
<tr>
<td>Package Version</td>
<td>For a file, this read-only setting shows the version number of the App-V package that corresponds with the last time that the file was modified. For any folder other than the root folder, this read-only setting shows the latest version number of the App-V package.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Specify the data type of the file or folder. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Application Data—Changes to the file or folder are saved for all users of the App-V package on the client system.</td>
</tr>
<tr>
<td></td>
<td>• User Data—Changes to the file or folder are saved for only the logged-on user.</td>
</tr>
<tr>
<td></td>
<td>• Unspecified—The data type of the file or folder is not configured.</td>
</tr>
<tr>
<td>VFS Path</td>
<td>This read-only setting contains the path that is used by the App-V client to overlay the virtual file or folder onto the corresponding physical location. It is always set for files that are inside of the VFS folder. And it is set for folders found inside the VFS folder only when the folder’s Isolation setting has been set to Override. This indicates that the folder should be fully virtualized.</td>
</tr>

General Information View

AdminStudio 2019 | Virtual Package Editor

Version • Some settings apply to particular versions of App-V packages. Version-specific differences are noted where appropriate.

The General Information view contains basic information about your virtual package. It contains a History pane, plus a number of settings that you can configure.

History Pane

Version • The History pane is available for App-V 4.x packages.

The History pane in the General Information view shows read-only information such as each date on which the package was saved, the GUID that corresponds with each saved version, and the version of App-V that was used when building the App-V package. Each time that you save your .sft file, the Virtual Package Editor adds a new history entry to the History pane.

General Information Settings

The General Information view settings are organized into the following main categories:

• App-V Settings
• Advanced Settings
• App-V Server URL Settings

App-V Settings

Use the App-V area of the General Information view settings to view or specify basic information such as the name of the virtual package and details such as the package GUID and version number. The following settings are available in this area.

Table 11-31 • App-V Settings in the General Information View

<table>
<thead>
<tr>
<th>Setting</th>
<th>App-V Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>App-V 4.x, App-V 5</td>
<td>Enter a name for the App-V package.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Tip</strong> If your virtual package contains multiple applications, you can specify the name that identifies the entire package. For example, Microsoft Office could be used to identify a package that contains Microsoft Word and Microsoft Excel applications that run in the same virtual environment.</td>
</tr>
<tr>
<td>Publisher</td>
<td>App-V 5</td>
<td>Displays the publisher (manufacturer) of the applications contained in this App-V package.</td>
</tr>
</tbody>
</table>

<th>Setting</th>
<th>App-V Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enforce Security Descriptors</td>
<td>App-V 4.x</td>
<td>This read-only setting indicates whether security descriptors of the application in the App-V package are enforced after it is deployed to the client system.</td>
</tr>
</tbody>
</table>
| Allow Local Interaction     | App-V 4.x     | Specify whether you want named objects (events, mutexes, semaphores, file mappings, and mailslots) and COM objects to be created in the global namespace. Available options are:  
  - **Yes**—Named objects and COM objects are created in the global namespace, allowing virtual applications to interact with the applications of the client operating system.  
  - **No**—Named objects and COM objects are isolated inside the virtual environment.    |

**Advanced Settings**

Use the Advanced Settings area of the General Information view or specify advanced App-V settings such as named object interaction, COM object interaction, and browser helper object settings. The following settings are available in this area.

**Table 11-32 • Advanced Settings in the General Information View**

<table>
<thead>
<tr>
<th>Settings</th>
<th>App-V Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Named Objects Interaction</td>
<td>App-V 5</td>
<td>Enable this option to allow all named objects to interact with the local system. The default setting is <strong>False</strong> to keep these objects isolated from the local system.</td>
</tr>
<tr>
<td>COM Objects Interaction</td>
<td>App-V 5</td>
<td>Enable this option to allow COM to interact with the local system. The default setting is <strong>Isolated</strong> to keep the COM components isolated from the local system.</td>
</tr>
<tr>
<td>COM In Process Enabled</td>
<td>App-V 5</td>
<td>Enable this option to allow in-process COM to interact with the local system. The <strong>COM Objects Interaction</strong> option also has to be set to <strong>Integrated</strong> for this option to have effect.</td>
</tr>
<tr>
<td>COM Out of Process Enabled</td>
<td>App-V 5</td>
<td>Enable this option to allow out-of-process COM to interact with the local system. The <strong>COM Objects Interaction</strong> option also has to be set to <strong>Integrated</strong> for this option to have effect.</td>
</tr>
<tr>
<td>Full VFS Write Mode</td>
<td>App-V 5</td>
<td>Set to <strong>True</strong> to enable a virtual application to write to its VFS files and folders. The default value is <strong>False</strong>.</td>
</tr>
</tbody>
</table>
App-V Server URL Settings

Use the App-V Server URL area of the General Information view settings to specify the location from which the App-V package is streamed. The following settings are available in this area.

Table 11-33 • App-V Server URL Settings in the General Information View

<table>
<thead>
<tr>
<th>Setting</th>
<th>App-V Version</th>
<th>Description</th>
</tr>
</thead>
</table>
| Protocol | App-V 4.x | Select the protocol that you want to use to stream the sequenced application package from the virtual application server to an Application Virtualization Client. Available options are:  

- **RTSP**—The real-time streaming protocol streams the App-V package. This is the default option.  
- **RTSPS**—The real-time streaming protocol with transport layer security streams the App-V package.  
- **FILE**—The App-V package are streamed from a file share.  
- **HTTP**—The hypertext transport protocol streams the App-V package.  
- **HTTPS**—The secure hypertext transport protocol streams the App-V package. |
| Host | App-V 4.x | Specify the host—the virtual application server or the load balancer in front of a group of virtual application servers that stream the App-V package to the Application Virtualization Client. You can either specify a static host name or IP address, or you can enter `%SFT_SOFTGRIDSERVER%` to indicate an environment variable. |

**Note** • If you enter `%SFT_SOFTGRIDSERVER%`, you must set up the SFT_SOFTGRIDSERVER system environment variable on each Application Virtualization Client. The value of this environment variable should be the name or IP address of the host.

When you assign the variable on a client system, any Application Virtualization Client session that is running on the system must be closed and reopened; otherwise, the session is not aware of the new application source.

Registry View

The Registry view enables you to define registry keys, values, and data for your App-V package. This view also lets you configure isolation options for selected registry keys. Isolation options indicate how the isolation environment provides access to system resources that the application needs: you can choose to override one or more keys on the client system, or you can choose to create a merged view of one or more keys for the virtual environment.

Note that the registry entries that are configured in the Registry view affect only the application in your App-V package. They do not affect any other App-V packages that are streamed to the Application Virtualization Client, and they do not affect any products that are installed to the client system.

Icons in the Registry View

The Registry view uses different icons to help you distinguish between different types of registry entries. Following is a list of the possible icons in the Registry view.

Table 11-34 • Icons in the Registry View

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon]</td>
<td>This icon identifies for the root node—the Registry explorer. This icon also identifies the MACHINE and USER predefined keys.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>This icon identifies a registry key.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>This icon identifies a registry key that is configured to override the registry content on the physical client system.</td>
</tr>
</tbody>
</table>
Settings in the Registry View

The Registry view contains the registry entries that are configured for your App-V package. When you select a registry key or value in the Registry view, the following settings are available.

Table 11-35 • Registry Key and Value Settings in the Registry View

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the selected registry key or value.</td>
</tr>
<tr>
<td>Value Data</td>
<td>Enter the data for the selected registry value, or (for a registry key) enter the data for the selected key’s default value.</td>
</tr>
</tbody>
</table>
| Value Type | Select the appropriate type of registry data for the selected registry entry.  
If you select the REG_QWORD type, ensure that the operating system of the client system supports it.  
This setting applies to registry values; it does not apply to registry keys. The default value of a registry key is always the REG_SZ type of value. |

Shortcuts View

AdminStudio 2019 | Virtual Package Editor

The Shortcuts view lets you define the targets for your virtual application. This view also lets you define entry points, such as shortcuts, for each target. Entry points enable end users to launch each target in an App-V package from within the virtual environment.

Icons in the Shortcuts View

The Targets explorer in the Shortcuts view uses different icons to help you distinguish between different types of items. Following is a list of the possible icons in the Shortcuts view.

Table 11-36 • Icons in the Shortcuts View

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="" alt="Icon" /></td>
<td>This icon identifies the root node—the Targets explorer.</td>
</tr>
</tbody>
</table>
### Table 11-36 • Icons in the Shortcuts View (cont.)

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Target" /></td>
<td>This icon identifies a target in the primary App-V package. It is recommended that all of the targets in your virtual package be associated with each of the package’s dependencies.</td>
</tr>
<tr>
<td><img src="image" alt="Group" /></td>
<td>This icon identifies a container that holds the shortcuts that are associated with a target.</td>
</tr>
<tr>
<td><img src="image" alt="Shortcut" /></td>
<td>This icon identifies a shortcut.</td>
</tr>
<tr>

<tr>
<td><img src="image" alt="Environment Variable" /></td>
<td>This icon identifies an environment variable.</td>
</tr>
<tr>
<td><img src="image" alt="Group" /></td>
<td>This icon identifies a container that holds the file extensions that are associated with a target.</td>
</tr>
<tr>
<td><img src="image" alt="File Extension" /></td>
<td>This icon identifies a file extension.</td>
</tr>
<tr>
<td><img src="image" alt="Verb" /></td>
<td>This icon identifies a verb for a file extension.</td>
</tr>
<tr>
<td><img src="image" alt="Group" /></td>
<td>This icon identifies a container that holds the scripts that are associated with a target.</td>
</tr>
<tr>
<td><img src="image" alt="Script" /></td>
<td>This icon identifies a script.</td>
</tr>
</tbody>
</table>

### Settings in the Shortcuts View

Use the Targets explorer in the Shortcuts view to define each target in your App-V package. Under each target, you can configure associated shortcuts, environment variables, file extensions, and scripting. The settings that are displayed in the Shortcuts view differ, depending on what type of item you select in this view. For descriptions of each of the settings in the Shortcuts view, see the following:

- Target Settings
- Shortcut Settings
- Environment Variables View
- File Extension Settings
- Verb Settings for a File Extension
- Scripting Settings

Target Settings

When you select a target in the Shortcuts view, the following settings are available.

Table 11-37 • Target Settings in the Shortcuts View

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the target.</td>
</tr>
<tr>
<td>Target</td>
<td>Enter the path and file name of the file in the App-V package or on the client system that should be launched when end users launch the target’s shortcut or other entry point. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to browse to the target file.</td>
</tr>
<tr>
<td>Icon</td>
<td>Enter the path to the icon file (.ico, .exe, or .dll) that contains the icon resource for the shortcut. The location can be in the App-V package, or on your computer or the network. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to browse to the icon. If the icon file that you specify contains more than one icon resource, after the icon path, add a comma and then the index number. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon. To specify the third icon in C:\MyIcons.dll, enter the following: C:\MyIcons.dll,2</td>
</tr>
<tr>
<td>Target Version</td>
<td>Enter the version number of the target.</td>
</tr>
<tr>
<td>Arguments</td>
<td>Enter the command-line arguments for the shortcut. These arguments work in the same way as any other command-line arguments. For example, you can link a file to an executable file or cause an executable file to run silently by passing command-line arguments.</td>
</tr>
</tbody>
</table>

Note • Verify that the syntax is correct because the Virtual Package Editor does not do this.
Table 11-37 • Target Settings in the Shortcuts View (cont.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working Directory</td>
<td>Enter the working directory for the target. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to select or create the directory. The working directory is the default directory that is displayed in standard file-opening and file-saving dialog boxes, as well as the current directory used by the App-V application.</td>
</tr>
<tr>
<td>Terminate Children</td>
<td>Specify whether you want all of the applications and processes that were launched by the App-V application to be closed when the end user exits the App-V application.</td>
</tr>
</tbody>
</table>

Note • These Target Settings are displayed for App-V 4.x packages only. For App-V 5.0 packages, these settings are under Shortcut Settings.

Shortcut Settings

AdminStudio 2019 | Virtual Package Editor

When you select a shortcut in the Shortcuts view, the following settings are available.

Table 11-38 • Shortcut Settings in the Shortcuts View

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Enter the name of the shortcut as it should appear on the client system.</td>
</tr>
<tr>
<td>Location</td>
<td>Enter the path to the folder that contains the shortcut file. As an alternative to manually entering a value, you can click the Browse Your Computer button or select a predefined folder from the drop-down list.</td>
</tr>
<tr>
<td>Target</td>
<td>Enter the path and file name of the file in the App-V package or on the client system that should be launched when end users launch the target’s shortcut or other entry point. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to browse to the target file.</td>
</tr>
</tbody>
</table>

Note • App-V 5.0 packages only. For App-V 4.x packages, this setting is under Target Settings.
Chapter 11  Using the Virtual Package Editor

Virtual Package Editor Reference

Target Version
Enter the version number of the target.

*Note* • App-V 5.0 packages only. For App-V 4.x packages, this setting is under Target Settings.

Arguments
Enter the command-line arguments for the shortcut. These arguments work in the same way as any other command-line arguments. For example, you can link a file to an executable file or cause an executable file to run silently by passing command-line arguments.

*Note* • Verify that the syntax is correct because the Virtual Package Editor does not do this.

*Note* • App-V 5.0 packages only. For App-V 4.x packages, this setting is under Target Settings.

Working Directory
Enter the working directory for the target. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to select or create the directory.

The working directory is the default directory that is displayed in standard file-opening and file-saving dialog boxes, as well as the current directory used by the App-V application.

*Note* • App-V 5.0 packages only. For App-V 4.x packages, this setting is under Target Settings.

Icon
Enter the path to the icon file (.ico, .exe, or .dll) that contains the icon resource for the shortcut. The location can be in the App-V package, or on your computer or the network. As an alternative to manually entering a value, you can click the Browse This Package button or the Browse Your Computer button to browse to the icon.

If the icon file that you specify contains more than one icon resource, after the icon path, add a comma and then the index number. For example, 0 refers to the first icon in the file, 1 refers to the second icon, and 2 refers to the third icon. To specify the third icon in C:\MyIcons.dll, enter the following:

C:\MyIcons.dll,2

*Note* • App-V 5.0 packages only. For App-V 4.x packages, this setting is under Target Settings.

Application User Model Id
Specify the AppUserModelId that is associated with the target of this shortcut.

*Note* • App-V 5.0 packages only.

Scripting Settings

AdminStudio 2019 | Virtual Package Editor

When you select a script in the Shortcuts view, the following settings are available.

Table 11-39 • Scripting Settings in the Shortcuts View

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event</strong></td>
<td>Select the timing for the script that you want to launch. Available options are:</td>
</tr>
<tr>
<td>• <strong>Pre-stream</strong>—The script or executable file runs after the end user launches the App-V application, but before feature block 1 of the application is streamed to the client system and before the virtual environment is set up. This type of script or executable file is run outside the virtual environment.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Post-stream</strong>—The script or executable file runs after the end user launches the App-V application and after feature block 1 of the application is streamed to the client system, but before the virtual environment is set up. This type of script or executable file is run either inside or outside the virtual environment.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Pre-launch</strong>—The script or executable file runs after the end user launches the App-V application, after feature block 1 of the application is streamed to the client system, and after the virtual environment is set up. This type of script or executable file is run either inside or outside the virtual environment.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Post-launch</strong>—The script or executable file runs after the App-V application is launched, but before the end user has access to the application. This type of script or executable file is run either inside or outside the virtual environment.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Post-shutdown</strong>—The script or executable file runs after the App-V application has been closed. This type of script is run outside the virtual environment.</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Specify the type of script that you want to be run. Available options are:</td>
</tr>
<tr>
<td>• <strong>Single command (HREF)</strong>—The App-V package references an external script or an executable file. The contents of the script are launched directly on the client system. The Command Prompt window is not displayed unless the process that is being called opens it.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Command script (SCRIPTBODY)</strong>—The contents of the script are stored in the App-V package and copied to a temporary .bat file in the root folder (typically under the Q drive) of the App-V package on the client system. The .bat file is launched from a visible Command Prompt window.</td>
<td></td>
</tr>
</tbody>
</table>

You can use either type of scripting to call an executable file that exists in the folder on the virtual application server where the App-V package is stored.
### Table 11-39 • Scripting Settings in the Shortcuts View (cont.)

<table>
<thead>
<tr>

Virtual Services View

Windows services are executable files that Windows–based systems run in the background to manage various system tasks. A service is an executable file, but it must be designed as a service; you cannot automatically use an arbitrary executable file as a service. Windows services can be configured to run every time that the system starts or on demand when needed. The Virtual Services view enables you to configure services that you want to include in your App-V package so that they are available in the virtual environment.

The Virtual Services view shows the services that are configured for your App-V package. The Virtual Services view settings are organized into the following main categories:

- General Settings
- Error Handling Settings

General Settings

Use the General area of the Virtual Services view settings to specify information such as the name and location of the virtual service, as well as the type of service. This area is also where you specify when the service should be started. The following settings are available in this area:

**Table 11-40 • General Settings in the Virtual Services View**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the service. The name that you enter is used on the service's Properties dialog box. (To access an installed service's properties: In the Services administrative tool, right-click the service and then click Properties.) The maximum number of characters that is allowed is 256. The forward slash (/) and the backslash () are not valid characters for service names. The case of the name that you enter is preserved in the service control manager. Display name comparisons are always case-insensitive.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Enter the name that you want to be displayed for this service in the service control manager and in other user interfaces. The maximum number of characters that is allowed is 256. The case of the display name that you enter is preserved in the service control manager. Display name comparisons are always case-insensitive.</td>
</tr>
<tr>
<td>Path to Executable File</td>
<td>Enter the fully qualified path to the executable file for the service. If the path contains one or more spaces, surround the path with quotation marks. You can include arguments that you want to be passed for a service that starts automatically. As an alternative to manually entering the path, you can click the Browse This Package button to browse to the executable file.</td>
</tr>
<tr>
<td>Service Type</td>
<td>Select the type of service that you are installing.</td>
</tr>
<tr>
<td>Service Is Interactive</td>
<td>Specify whether you want the service to be able to interact with users.</td>
</tr>
</tbody>

</tr>
</tbody>
</table>
**Error Handling Settings**

Use the Error Handling area of the Virtual Services view settings to specify what behavior should occur if the service fails. The following settings are available in this area:

**Table 11-41 • Settings in the Virtual Services View**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Reset Period**    | Specify the amount of time (in seconds) between the reset intervals for the service’s failure count. As an alternative, you can select one of the values from the list in this setting.  
  The service control manager counts the number of times that the service has failed since the system was last restarted. When this interval has elapsed, the count is reset to the number 0 if the service has not failed during the reset period. When the service fails, the system performs an action that is specified for the First Error setting, the Second Error setting, or the Additional Errors setting, depending on how many errors have occurred since the last failure count reset or system restart.  
  To indicate that the failure count should never be reset, select Never or enter a value of -1. |
| **Reboot Message**  | Specify the message that should be displayed before the computer is restarted in response to an error.  
  Note that Reboot the Computer must be listed as one of the action types for the First Error setting, the Second Error setting, or the Additional Errors setting; otherwise, the Reboot Message setting is ignored. |
| **Command**         | Specify the command line that should be run if the Run a Command option is selected for the First Error, Second Error, or Additional Errors setting, and the first, second, or subsequent error occurs during service startup. Programs or scripts that you specify should not require input from end users.  
  The command line that you specify is used to create a new process that runs under the same account as the service. |
| **First Error**     | Select the action that you want the service control manager to perform the first time that the service fails. |
| **First Action Delay** | Specify the time (in milliseconds) that the service control manager should wait before performing the action that is specified in the First Error setting. As an alternative, you can select one of the values from the list in this setting. |
| **Second Error**    | Select the action that you want the service control manager to perform the second time that the service fails. |
| **Second Action Delay** | Specify the time (in milliseconds) that the service control manager should wait before performing the action that is specified in the Second Error setting. As an alternative, you can select one of the values from the list in this setting. |
| **Additional Errors** | Select the action that you want the service control manager to perform the third and subsequent times that the service fails. |

Configuring Virtual Services
Adding a Virtual Service to a Virtual Package
You can use AdminStudio to create customized virtual applications in the Microsoft App-V, VMware ThinApp, and Citrix XenApp virtual application formats.

Information about creating virtual applications is organized into the following sections:

- **About Virtualization**
- **About the AdminStudio Virtualization Interface**
- **Creating Microsoft App-V Packages**
- **Creating Citrix Profiles**
- **Creating ThinApp Applications**

**About Virtualization**

*Note* • *This section provides a description of virtualization in general for those that are not familiar with it. It does not represent the architecture of any specific vendor.*

Virtualization enables you to isolate an application in its own environment so that it does not conflict with existing applications or modify the underlying operating system.

- **Limitations of a Standard Installation Environment**
- **Benefits of Application Virtualization**
Limitations of a Standard Installation Environment

A typical Windows application has dependencies on components that are shared by multiple applications. Applications access these shared system resources, such as the registry or Windows system files. When an installation author recognizes that their application references a shared system component, they include a merge module to install that component.

When one of these shared components is installed, it is possible that a previously installed version of the same component could be overwritten; this may cause the existing application to break. A similar problem could occur when one of these applications containing a shared component is uninstalled. Because of these possible problems, extensive compatibility testing needs to be performed before an application can be distributed in the enterprise environment.

The following diagram provides an example of two conflicting installed applications.

![Example of Conflicts Between Two Installed Applications](image)

**Figure 12-1:** Example of Conflicts Between Two Installed Applications

Benefits of Application Virtualization

Virtual applications run in virtual environments that keep the application layer and the operating system layer separate. Each application includes its own configuration information in its virtual environment. As a result, many applications can run side-by-side with other applications on the same computer without any conflicts.

Even though virtual applications are not installed on the local machine, they exhibit the same functionality and access to local services as locally installed applications, and also nearly the same performance characteristics.

The following diagram provides an example of how application virtualization would solve the conflicts that are shown in the previous example.
Application virtualization allows the configuration of an application to be standardized to an isolation environment, rather than to an individual user’s desktop machine. Application objects, files, and registry settings are contained within this isolation environment. Critical application resources are managed locally by the isolation environment, thus minimizing resource dependencies between applications.

Application virtualization greatly reduces the scope for conflicts between applications and, therefore, simplifies compatibility testing.

About the AdminStudio Virtualization Interface

AdminStudio 2019

Project • The Microsoft App-V, ThinApp, and Citrix Assistants are available in the following project types:

- Basic MSI
- MSI Database (Direct Edit Mode)
- Transform (Direct MST Mode)

AdminStudio provides the Microsoft App-V Assistant, ThinApp Assistant, and Citrix Assistant to help you author a virtual application. You cannot configure a virtual application’s options using the Installation Designer.
Information about the interface of these Assistants is organized in the following topics:

- About the Virtualization Assistant Tabs
- Using the More Options, Other Places, and Help Links Sections in a Virtualization Assistant
- Navigating in a Virtualization Assistant
- Opening the Installation Designer
- Showing or Hiding the Virtualization Assistants

About the Virtualization Assistant Tabs

AdminStudio 2019

When you create a new Basic MSI or MSI Database project, the Microsoft App-V, VMware ThinApp, and Citrix XenApp tabs are displayed in the AdminStudio interface. The home page of each Assistant has a diagram that illustrates the process of creating a virtual application using that technology.

You can work within these Assistants to create a project and configure its options and requirements. You can also use the Project Assistant or the Installation Designer to define the traditional Windows Installer version of your product installation.

How the Virtualization Assistants Work

AdminStudio 2019

When you create a new Basic MSI or MSI Database project, the Microsoft App-V, VMware ThinApp, and Citrix XenApp tabs are displayed in the AdminStudio interface.

The Project Assistant tab and the Installation Designer tab show the underlying framework for your product's Windows Installer-based installation. Some of these product elements are also displayed in the virtualization Assistants, where you can configure a virtual application’s options and requirements.

Integration with the Project Assistant and the Installation Designer

AdminStudio 2019

Information that you enter in a virtualization Assistant is saved directly to the underlying project file. The Microsoft App-V Assistant, ThinApp Assistant, Citrix Assistant, Project Assistant, and Installation Designer run simultaneously. Any changes that you make in one are reflected instantly in the other. For example, if you remove a file in one of the virtualization Assistants, that file is no longer available in your project, and it does not appear in the Project Assistant or the Installation Designer.

See Also

Opening the Installation Designer
Showing or Hiding the Virtualization Assistants

Using the More Options, Other Places, and Help Links Sections in a Virtualization Assistant

AdminStudio 2019

The left column on each page of the virtualization Assistants contains one or more lists of links to help you in creating your installation and finding information:
• **More Options**—Provides additional configuration options relating to the specific virtualization Assistant page. These are less common options that complete the functionality of the Assistant.

• **Other Places**—The view in the Installation Designer that corresponds to the current virtualization Assistant page. Clicking the link launches the full Installation Designer and activates that view.

• **Help Links**—This list provides links to help topics pertinent to the current virtualization Assistant page.

## Navigating in a Virtualization Assistant

### Task

To navigate from one page of a virtualization Assistant to another, do one of the following:

- To navigate directly to a specific page, click the appropriate icon in the navigation bar at the bottom of the page.
- To follow the assistant steps sequentially, do one of the following:
  - Click the Next or Back arrow buttons to move forward or backward.
  - Press CTRL+TAB to move to the next page and CTRL+SHIFT+TAB to move to the previous page.
- To move back to the Home page and view the overview diagram, click the Home button on the navigation bar.

## Opening the Installation Designer

### Task

The **Installation Designer** tab displays the views in the AdminStudio interface. You can use this tab to configure your Windows Installer package. To open a view in the Installation Designer, click the **Installation Designer** tab.

**Note** • The Installation Designer and the virtualization Assistants run simultaneously. Any changes that you make in one are reflected instantly in the other.

## Showing or Hiding the Virtualization Assistants

### Task

To show or hide a virtualization Assistant:

On the **View** menu, click **Microsoft App-V Assistant**, **ThinApp Assistant**, or **Citrix Assistant**.

When an Assistant's command has a check mark next to it, the tab for that Assistant is shown in the InstallShield interface. Similarly, if one of the virtualization Assistants is hidden, you can choose to display it.
Creating Microsoft App-V Packages

Microsoft Application Virtualization (App-V) enables you to deploy applications to end users without requiring the applications to be installed locally. Instead, only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middleware, plugins, and other applications. Using App-V enables you to centralize the deployment of applications and reduce application-to-application conflicts.

Information about Microsoft App-V and creating Microsoft App-V packages is presented in the following sections:

- Overview of Microsoft Application Virtualization and the Microsoft App-V Assistant
- Using the Microsoft App-V Assistant to Create an App-V Package
- Microsoft App-V Assistant Reference

Overview of Microsoft Application Virtualization and the Microsoft App-V Assistant

Microsoft Application Virtualization (App-V) enables you to deploy applications to end users without requiring the applications to be installed locally. Instead, only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middleware, plugins, and other applications. Using App-V enables you to centralize the deployment of applications and reduce application-to-application conflicts.

The Microsoft App-V Assistant, which you can use to configure and build App-V packages, consists of the following pages:

Creating Microsoft App-V Packages

About Microsoft Application Virtualization (App-V) and the Microsoft App-V Assistant

This section provides an overview of Microsoft Application Virtualization and its infrastructure, and explains the benefits of using the Microsoft App-V Assistant to create App-V packages:

- **Overview**
- **Microsoft Application Virtualization Infrastructure**
- **Benefits of Using the Microsoft App-V Assistant**

**Overview**

Microsoft Application Virtualization (App-V) enables you to deploy applications to end users without requiring the applications to be installed locally. Instead, only the App-V client needs to be installed on the client machines. Even though these virtual applications are never installed, they can communicate with the local operating system, middleware, plugins, and other applications. Using App-V enables you to centralize the deployment of applications and reduce application-to-application conflicts.

Because App-V packages are not installed on the client, there is minimal impact on the host operating system or other applications. As a result, application conflicts and the need for regression testing are dramatically reduced.

Using Microsoft Application Virtualization enables you to centralize the installation and management of deployed applications, and control access to applications. The App-V client presents to the end user a list of applications to which that end user has access.

For information on Microsoft Application Virtualization and the Microsoft App-V Assistant, see the following topics:

- About Microsoft Application Virtualization (App-V) and the Microsoft App-V Assistant
- Components of an App-V Package
- About the Microsoft App-V Assistant
Microsoft Application Virtualization Infrastructure

The Microsoft Application Virtualization (App-V) infrastructure includes:

- **App-V Sequencer**—The App-V Sequencer converts application data into a format that is compatible with the App-V server and client, producing an App-V package.

- **App-V Server**—An App-V package can be placed on one or more App-V servers so that it can be streamed down to the clients on demand and cached locally.

- **Application Virtualization Client**—The App-V client is the system component that enables the end user to interact with the App-V packages that are available on the App-V server.

Benefits of Using the Microsoft App-V Assistant

Instead of using the App-V Sequencer to create App-V packages, you can use the InstallShield Microsoft App-V Assistant, as shown in the following diagram:

![Diagram of App-V Assistant workflow]

**Figure 12-3:** Using the Microsoft App-V Assistant to Create an App-V Package

Using the Microsoft App-V Assistant instead of the Microsoft App-V Sequencer to create an App-V package offers the following benefits:

Product Installation on a Clean Machine Is Not Required

The Microsoft App-V Sequencer obtains the information it needs to create an App-V package by installing a package on a clean machine and then comparing the file system snapshot that it took prior to installation with one it takes after installation. To perform this task properly, there are two requirements:
● **The product must be installed on a clean machine**—To ensure that all proper changes made by the installation are captured, sequencing needs to be performed on a clean machine (a computer with only the operating system, necessary service packs, and the App-V Sequencer installed on it). A new clean machine would need to be re-created for each application that is sequenced.

● **The installation directory must be known before sequencing can begin**—In order to sequence the application effectively, you must have detailed knowledge of the how the installation is supposed to work. Prior to beginning the sequencing process, you are required to specify the installation directory for the application being sequenced. This information is often not readily available, and may require you to open the installation in an editing tool, such as InstallShield, in order to find it, or run the installation one time prior to sequencing.

Instead of installing the package, the Microsoft App-V Assistant obtains the information it needs to create an App-V application directly from the installation. You are not required to have any knowledge of settings within the installation, such as the installation directory. Because there is no need to install the application to obtain this information, no permanent changes are made to the local machine and a clean machine is not required.

### Ability to Test the App-V Package Immediately After Conversion

To run an App-V package, the App-V client must be installed on the machine. Because sequencing must be performed on a clean machine, which does not have the App-V client installed, you cannot immediately test a newly created App-V package on the same machine where you sequenced it.

The Microsoft App-V Assistant includes a launch utility that allows you to launch and test the App-V package locally immediately after conversion, before distributing it to the App-V server.

This feature requires that the App-V client is installed on the local machine.

### Support for Including Diagnostic Tools in the App-V Package

When running a virtual application in its virtual environment, you may at some point want to examine its contents to evaluate or debug it. However, the standard diagnostic tools that you use to examine installed applications (such as the Registry Editor and the Windows Command Prompt window) are not normally available within the virtual environment for App-V 4.x. When a virtual application is running within its virtual environment, applications outside of that virtual environment cannot see into it.

When you use the InstallShield App-V Assistant to create an App-V 4.x package, you can choose to include shortcuts for diagnostic tools in the App-V package; these shortcuts enable you to use `cmd.exe` and `Regedit.exe` on the local machine, with access to the virtual environment.

Beginning with App-V 5.x, it is no longer necessary to include diagnostic tool shortcuts directly in the App-V package, since the App-V Launcher is capable of launching a Command Prompt window within the virtual environment.

### Components of an App-V Package

The files that comprise an App-V package depend on the version of the App-V package.
Components of an App-V 5.x Package (.appv)

The following table describes the main components of an App-V 5.x package (.appv):

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.appv</td>
<td>The .appv file is the compressed package file that contains all of the other parts of the package.</td>
</tr>
<tr>
<td>[Content_Types].xml</td>
<td>This file contains a list of file extensions that the package supports and the type of content to which each extension type maps.</td>
</tr>
<tr>
<td>AppxBlockMap.xml</td>
<td>This file contains a list of files with details such as header size and file size.</td>
</tr>
<tr>
<td>AppxManifest.xml</td>
<td>This file contains metadata about the package.</td>
</tr>
<tr>
<td>FilesystemMetadata.xml</td>
<td>This file contains information such as short file names, the directory-file hierarchy, and the mapping between the root folder and INSTALLDIR.</td>
</tr>
<tr>
<td>Registry.dat</td>
<td>This file contains registry data for the package.</td>
</tr>
<tr>
<td>StreamMap.xml</td>
<td>This file contains feature block 1 information.</td>
</tr>
</tbody>
</table>

Components of an App-V 4.x Package (.sft)

The following table describes the main components of an App-V 4.x package (.sft):

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.sft</td>
<td>The .sft file contains all of the files, registry information, and other configuration details of the package.</td>
</tr>
<tr>
<td>Manifest file</td>
<td>This file is an XML file that lists all of the .osd files in an App-V package.</td>
</tr>
<tr>
<td>.osd</td>
<td>The .osd files are XML-based files that describe the package’s individual targets (or applications) that can be run.</td>
</tr>
<tr>
<td>.ico</td>
<td>The .ico files are icons files that are used for published shortcuts and file type associations.</td>
</tr>
<tr>
<td>.sprj</td>
<td>This file is the Microsoft App-V Sequencer project file. It contains references to the .sft and .osd files, and to a large number of settings related to the sequencing process.</td>
</tr>
</tbody>
</table>

Process for Authoring an App-V Package Using the Microsoft App-V Assistant

AdminStudio 2019 | Microsoft App-V Assistant

You can use the Microsoft App-V Assistant to convert a Windows Installer package into an App-V package. During this process, you can perform the following tasks:

- **Specify Package Information and Deployment Options**—Specify the package name, root folder name, enter a comment, specify any operating system requirements, and identify the deployment server.

- **Specify Files, Folders, Shortcuts, Registry Settings**—Specify the files, folders, application shortcuts, and registry settings that will be included in the App-V package.

- **Configure Isolation Options**—Set the isolation options for selected files, folders, and registry keys.

- **Build**—Specify build options and build an App-V package.

The following diagram illustrates the creation process for an App-V package:
Chapter 12  Creating Customized Virtual Applications

Creating Microsoft App-V Packages

Figure 12-4: Creating an App-V Package

Components of an App-V Package
Using the Microsoft App-V Assistant to Create an App-V Package

Supported InstallShield Project Types

The Microsoft App-V tab is available when one of the following InstallShield project types is open:

- Basic MSI Project
- MSI Database (Direct Edit Mode)
- Transform (Direct MST Mode)

See Also
Using the Microsoft App-V Assistant to Create an App-V Package

How Transforms are Included in an App-V Package

The Microsoft App-V Assistant supports the inclusion of transform files with Windows Installer packages in an App-V package.

- How transforms are applied when building an App-V package—When you are building an App-V package, transforms that you have specified are automatically applied to the base Windows Installer (.msi) package to create a temporary package, and then the App-V package is generated from that temporary package.
- **Creating a new transform**—You can create a new transform in InstallShield, and then build an App-V package from that transform file. When you create a new transform file in InstallShield, you specify the root .msi file in the Open Transform wizard. The steps you take to generate an App-V package after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

- **Converting a Windows Installer package with existing transforms**—If you have a Windows Installer package and one or more existing transform files, and you want to include these transforms in the App-V package, you need to open one of the transforms in InstallShield (rather than the .msi file). The Open Transform wizard will open, and you will be prompted to specify the root .msi file and which of the existing .mst files you want to include. The steps you take to generate an App-V package after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

⚠️ **Caution** - All of the transforms that you add to an App-V package must be located in the same folder as the Windows Installer .msi package so that they can be accessed when the App-V package is built.

- Creating Transforms
- Applying Transforms
- Using the Microsoft App-V Assistant to Create an App-V Package

### How Windows Services Are Integrated into an App-V Package

**AdminStudio 2019 | Microsoft App-V Assistant**

When you use the Microsoft App-V Assistant to convert a Windows Installer package to an App-V package, references to Windows services that are encountered are integrated into the App-V package. In a Windows Installer package, a Windows service may be indicated by either an entry in its ServiceInstall table or by a Registry entry for Windows services.

- **ServiceInstall table**—If a Windows Installer package’s use of a Windows service is indicated by an entry in the ServiceInstall table, the Microsoft App-V Assistant will convert that entry to a standard Registry entry for Windows services.

- **Registry entry**—If a Windows Installer package’s use of a Windows service is indicated by a Registry entry for Windows services (perhaps as the result of being repackaged), the Microsoft App-V Assistant does not need to make any changes to support the application’s use of the Windows service within the virtual environment.

### Start Up and Shut Down Sequences

If an App-V package has an associated Windows service, App-V will start up the Windows service first, in the virtual environment, and then start up the virtual application. You will see the Windows service start up in the Task Manager as a separate process, but App-V will be running the service within the virtual environment.

Upon shut down, App-V will first shut down the virtual application and then shut down the Windows service.
Using the Microsoft App-V Assistant to Create an App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

The steps you need to take to create an App-V package are the following:

**Version • This information applies to App-V 4.x packages.**

**Specifying Package Information and Deployment Options**

AdminStudio 2019 | Microsoft App-V Assistant

When you are creating an App-V package, the first step is to specify the package name, root folder name, and enter a comment on the Package Information page. On this page, you can also specify any operating system requirements, identify the deployment server, and specify whether to include diagnostic tools with the virtual package. This page also lets you specify upgrade information for your App-V package if appropriate.

**Specifying Package Information**

AdminStudio 2019 | Microsoft App-V Assistant

The first step in creating an App-V package is to enter information such as the package name.
**Task**

*To specify package information:*

1. In the Microsoft App-V Assistant, open the Package Information page.
2. In the Package Name field, enter a name for the virtual package.
3. In the Comments field, enter a short description of the App-V package.

**See Also**

Package Information Page

---

**Specifying Operating System Requirements**

AdminStudio 2019 | Microsoft App-V Assistant

To specify operating system requirements for an App-V package, perform the following steps:

---

**Task**

*To specify operating system requirements:*

1. In the Microsoft App-V Assistant, open the Package Information page.
2. Set the Does your App-V package have any specific operating system requirements? option to one of the following:
   - **No**—Select this option if this application will run on all of the listed operating systems. When this option is selected, the operating system check boxes are locked and cannot be changed.
   - **Yes**—Select this option if the application does not support one of the listed operating systems. When you select this option, the check boxes are unlocked and you can clear the selection of the unsupported operating systems.
3. If you selected Yes, select the operating systems that this application supports, and clear those that this application does not support.

---

**Specifying Upgrade Package Information**

AdminStudio 2019 | Microsoft App-V Assistant

InstallShield enables you to specify whether you want to create an upgrade for your App-V package. If you specify that you do want to create an upgrade, you can specify additional information about the upgrade, such as whether to append the version number to the App-V package file name.

---

**Task**

*To specify upgrade information:*

1. In the Microsoft App-V Assistant, open the Package Information page.
2. In the More Options area, click Upgrade Settings. The App-V Package Upgrade Settings dialog box opens.
3. Do one of the following:
To create an upgrade for your App-V package, select the **Enable Upgrade** check box. Then specify which package should be upgraded. If you want InstallShield to include the version number in the package name, select the **Append version number to package name** check box.

To avoid creating an upgrade package, clear the **Enable Upgrade** check box.

**See Also**
App-V Package Upgrade Settings Dialog Box

### Specifying the Deployment Server

To specify the deployment server for an App-V package, perform the following steps:

**Task**

1. In the **Microsoft App-V Assistant**, open the **Package Information** page.
2. Under **Where will the App-V package be deployed?**, configure the appropriate options. For more information, see **Package Information Page**.

### Including Diagnostic Tools in an App-V Package

The diagnostic tools are available for App-V 4.x packages. Starting with App-V 5.x, it is no longer necessary to inject diagnostic tool shortcuts directly into the package. The App-V Launcher tool is capable of launching a Command Prompt window within the virtual environment of an App-V 5.x package.

The Microsoft App-V Assistant lets you specify whether you want to include the Registry Editor and Windows Command Prompt diagnostic tools with your App-V package.

If you include diagnostic tools with your App-V package, you will be able to look at the registry or file system for the application while it is running in its virtual environment. For example, if you were running an App-V package and got an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

**Task**

1. In the **Microsoft App-V Assistant**, open the **Package Information** page.
2. In the **More Options** area, click **Diagnostic Tools**. The **Diagnostic Tools** dialog box opens.
3. If you want to include the Registry Editor with your App-V package so that you can use Regedt32.exe on the local machine and have access to the virtual environment, select the **Registry Diagnostics** option.

   If the **Registry Diagnostics** option is selected, a file named **Virtual Registry.osd** will be created in the App-V Package folder, which can be used to display the registry within the virtual environment.
4. If you want to include the Windows Command Prompt application with your App-V package so that you can use `Cmd.exe` on the local machine and have access to the virtual environment, select the **File System Diagnostics** option.

   If the **File System Diagnostics** option is selected, a file named `Virtual File System.osd` will be created in the App-V Package folder, which can be used to display the files and folders within the virtual environment.

5. Click **OK**.

   **Launching the Diagnostic Tools Within the Virtual Environment**

   If you selected the Registry Diagnostics or File System Diagnostics options on the Diagnostic Tools dialog box, shortcuts to those tools are automatically added to the App-V package.

   When an end user runs this App-V package, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:

   `[ProductName] Registry
   [ProductName] File System`

   When an end user launches one of these shortcuts, that diagnostic tool is launched inside the context of the application’s virtual environment.

   App-V Diagnostic Tools Dialog Box

---

**Managing Files in an App-V Package**

The next step in creating an App-V package is to view existing files and folders, add and delete files and folders, and set isolation options for files and folders.

The following tasks are performed on the Files page.

- Adding, Deleting, and Moving Files and Folders in an App-V Package
- Controlling the Display of Predefined Folders
- Specifying the Primary Application Directory

**See Also**
Files Page

**Adding, Deleting, and Moving Files and Folders in an App-V Package**

The directories in the destination tree on the Files page of the Microsoft App-V Assistant represent how your application will look when it is installed on to your end users’ machines.

On the Files page, you can view all of the files and folders that are currently in your App-V package, add new files and folders to include in the App-V package, and delete files and folders from the App-V package.
Adding Files to an App-V Package

To add files to an App-V package, perform the following steps:

Task To add files to an App-V package:

1. In the **Microsoft App-V Assistant**, open the **Files** page. The files and folders are listed in the **Microsoft App-V Application** tree, organized by installation directory.

   Folders are listed in the column on the left, and all of the files in the selected folder are listed on the right. Blue folders are the supported MSI standard folders. The folder with the check mark is **INSTALLDIR**, which represents the main product installation directory.

2. Browse through the folder tree to find the folder that you would like to add files to.

3. Select the folder and click the **Add Files** button. The **Open** dialog box opens.

4. Select the file or files that you want to add and click **Open**. The files you selected are now listed.

   **Tip** • To select multiple files, use the Shift key (for contiguous files) or the Ctrl key (for non-contiguous files).

Adding a File by Dragging and Dropping Files from Your System

You can also add files or folders to your App-V package on the Files page by dragging them from a directory on your computer to the desired location in the tree.

Adding an Existing Folder (and Its Contents) to an App-V Package

To add an existing folder and all of the files and subfolders within it to an App-V package, perform the following steps:

Task To add an existing folder to an App-V package:

1. In the **Microsoft App-V Assistant**, open the **Files** page. The files and folders are listed in the **Microsoft App-V Application** tree, organized by installation directory.

2. Browse through the folder tree to find the folder that you would like to add a folder into.

3. Select the folder and click the **Add Folders** button. The **Browse for Folder** dialog box opens, listing all of the directories available to your computer.

4. Select a folder and click **OK**.

   If you are editing an InstallShield project (not a Windows Installer package), you are prompted to choose whether you want to create a dynamic file link to the source folder.

5. Indicate whether you want to create a dynamic file link by selecting one of the following:

   • **No**—For more flexibility with App-V options, it is recommended that you select No to indicate that you do not want to use a dynamic file link, because you would then not be able to customize isolation options for any of the items in this folder.

   • **Yes**—If you wish to use the default isolation options for all the files and folders under this folder, then select the dynamic file link option by clicking **Yes**. The **Dynamic File Link Settings** dialog box would then open, prompting
you to specify the source folder for your dynamic link, and to set options regarding which files and folders to include in the dynamic link. See Dynamic File Link Settings Dialog Box.

The folder that you selected is now listed, along with of the files and folders within it.

Creating a New Folder

Task To create a new folder:

1. In the Microsoft App-V Assistant, open the Files page.
2. In the Microsoft App-V Application tree, right-click the folder that you want to contain the new folder, and click New Folder. InstallShield creates a new folder as a subfolder of the selected folder.
3. Enter a name for the new folder.

Moving Files and Folders

To change the folder’s location in the App-V package folder tree structure, perform the following steps:

Task To move a file or folder:

1. In the Microsoft App-V Assistant, open the Files page.
2. In the Microsoft App-V Application tree, drag the file or folder that you want to move to the new location.

Deleting Files and Folders

To delete a file or a folder (and all of its contents) from an App-V package, perform the following steps:

Task To delete a file or folder:

1. In the Microsoft App-V Assistant, open the Files page.
2. In the Microsoft App-V Application tree, right-click the file or folder that you want to delete. You are prompted to confirm the deletion.
3. Click Yes.

InstallShield removes the selected file or folder.

Caution • If you choose to delete a folder, you are also deleting all of the files and subfolders that the folder contains from the entire project, not just from the App-V package.

Note • You cannot delete predefined folders. You can only turn off the display of those folders. For more information, see Controlling the Display of Predefined Folders.
Controlling the Display of Predefined Folders

AdminStudio 2019 | Microsoft App-V Assistant

On the Files page, the Microsoft App-V package tree initially displays the more commonly used predefined folders, such as [CommonFilesFolder] and [ProgramFilesFolder]. You can show and hide predefined folders on this page.

Task

To display additional predefined folders:

1. In the Microsoft App-V Assistant, open the Files page.
2. Right-click the Microsoft App-V Application node (or any of the files or folders that are listed), point to Show Predefined Folder, and then click predefined folder that you want to show.

The folders that are currently displayed are preceded by a check mark; the folders that are not currently displayed do not have a check mark.

AdminStudio adds the predefined folder to root level of the Microsoft App-V package tree.

Tip • To hide a predefined folder, click it in the list of predefined folders.

Note • It is not possible to hide [ProgramFilesFolder].

Specifying the Primary Application Directory

AdminStudio 2019 | Microsoft App-V Assistant

When App-V packages are run on a machine that has Application Virtualization Client installed, they are run from the App-V cache drive.

For optimum performance, the bulk of the application’s files should be mounted to this drive at run time. In order to achieve this, it is useful to determine an application’s primary application directory so that this directory can be mounted to the App-V literal cache drive when the App-V package is loaded.

When an App-V package is built using InstallShield or any AdminStudio tool, the following series of steps are used to determine an App-V package’s primary application directory:

Table 12-5 • Steps to Automatically Determine the Primary Application Directory

<table>
<thead>
<tr>
<th>#</th>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Explicitly set primary</td>
<td>If a directory is specified on the Primary Application Directory dialog box, that directory is used.</td>
</tr>
<tr>
<td></td>
<td>application directory</td>
<td></td>
</tr>
</tbody>
</table>

For more information, see File Mapping Dialog Box.
Explicitly Specifying the Primary Application Directory

To specify the primary application directory for an App-V package, perform the following steps.

1. In the Microsoft App-V Assistant, open the File page.
2. In the More Options area, click Primary Application Directory. The Primary Application Directory dialog box opens, displaying the current primary application directory setting (if one has already been specified).
3. Click the ellipsis button (...). The Browse for Directory dialog box opens, listing all of the currently available destination directories for this App-V package.
4. Select one of the listed directories and click OK.

See Also
File Mapping Dialog Box
Setting Isolation Options for Folders and Files

AdminStudio 2019 | Microsoft App-V Assistant

Version • Some settings apply to particular versions of App-V packages. Version-specific differences are noted where appropriate.

The Microsoft App-V Assistant enables you to configure isolation options for folders (in App-V 4.x and 5.x packages) and for files (in App-V 4.x packages). Isolation options indicate how the isolation environment provides access to system resources that the virtual application needs: you can choose to ignore one or more folders on the client system, or you can choose to create a merged view of one or more folders.

Task

To configure isolation options for a folder or file:

1. In the Microsoft App-V Assistant, open the Files page.

2. Right-click the file or folder that you want to configure and then click Isolation Options. The Options dialog box opens.

3. Select the appropriate option.

4. Click OK.

Files and folders that have a custom isolation option are marked with a special icon:

For information on the various options that are available, see the following:

- Options Dialog Box (for Configuring Isolation Options for a Folder)
- Options Dialog Box (for Configuring Isolation Options for a File)

Inheritance of Isolation Options from Folders to Files

AdminStudio 2019 | Microsoft App-V Assistant

Isolation options for files and folders are always inherited. The App-V isolation environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for C:\Windows and one for C:\Windows\System32. When the application requests C:\Windows\System32\Notepad.exe, then the C:\Windows\System32 isolation rule will be applied because C:\Windows\System32 is a more specific reference to C:\Windows\System32\Notepad.exe than is C:\Windows.

Figure 12-5: Example of Inheritance of Isolation Options from Folders to Files
Modifying Shortcuts to the App-V Package’s Executable Files

You define application shortcuts to enable end users to launch an App-V package from within the virtual environment.

By default, the Microsoft App-V Assistant creates App-V packages for all of the executable shortcuts that exist in your project (or Windows Installer package). These shortcuts are listed in a checklist on the Applications page.

Caution • You must define at least one shortcut to enable end users to launch the application from the isolation environment.

On the Applications page, you can create, delete, include, exclude, or rename executable files, which are derived from the shortcuts in its Windows Installer package.

- App-V Packages and the Virtual Environment
- App-V Shortcut Requirements
- Creating a New App-V Package
- Including an Existing App-V Shortcut
- Excluding or Deleting an Existing App-V Package
- Excluding vs. Deleting App-V Package Shortcuts
- Renaming a Shortcut

Caution • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

App-V Packages and the Virtual Environment

Shortcuts provide the most visible entry points for launching the applications in the App-V package. Most App-V packages should have at least one shortcut.

On the Applications page of the Microsoft App-V Assistant, you can define application shortcuts to enable end users to launch an application in the App-V package. The Microsoft App-V Assistant creates shortcuts for any executable files that are added through the Files page. All shortcuts are added to the App-V package and published to the system when the package is published.

To deploy an App-V package—on a local drive or a network share—systems administrators simply need to give end users access to the App-V package.

App-V Shortcut Requirements

For each App-V package, you can define one or more shortcuts. Shortcuts provide the most visible entry points for launching the applications in the App-V package. Most App-V packages should have at least one shortcut.
Creating a New App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

On the Applications page of the Microsoft App-V Assistant, specify the files for which you want to create shortcuts.

Task To create a new App-V shortcut:

1. In the Microsoft App-V Assistant, open the Applications page.
2. Click New. The Browse for a Shortcut Target File dialog box opens and prompts you to select a file within this App-V package.
3. Select the target for the shortcut that you are creating.
4. Click Open. A new shortcut is listed, and it is named the same name as the selected file.
5. To include this shortcut in the App-V package, make sure that its check box is selected.

Including an Existing App-V Shortcut

AdminStudio 2019 | Microsoft App-V Assistant

If you want to include a previously excluded shortcut in an App-V package, perform the following steps.

Task To include an existing App-V package:

1. In the Microsoft App-V Assistant, open the Applications page.
2. To include a previously excluded shortcut, select the shortcut and select the check box.

Excluding or Deleting an Existing App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

To prevent a shortcut from being created in the App-V package, you can choose to either delete or exclude it.

- **Excluding a shortcut**—When you exclude a shortcut, it will not be created in the App-V package, but it will remain in the InstallShield project.
- **Deleting a shortcut**—When you delete a shortcut, it is removed from both the App-V package and the InstallShield project.

**Caution** • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

If you have any unnecessary shortcuts in your project, you can simply exclude them from the App-V package by unchecking them in the shortcuts list. If you like to permanently remove a shortcut, you can delete it from the shortcut list.

Excluding a Shortcut

If you want to exclude one of these shortcuts from being created in the App-V package, perform the following steps.
Task To exclude a shortcut:

1. In the Microsoft App-V Assistant, open the Applications page.
2. Select the shortcut that you want to exclude and clear its check box.

Note • When you exclude a shortcut, it is not created in the App-V package, but it remains in the InstallShield project.

Deleting a Shortcut

To delete a shortcut, perform the following steps.

Task To delete a shortcut:

1. In the Microsoft App-V Assistant, open the Applications page.
2. Select the shortcut and click Delete.

Caution • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

Excluding vs. Deleting App-V Package Shortcuts

Excluding a shortcut—When you exclude a shortcut, it will not be created in the App-V package, but it will remain in the InstallShield project. This means that the shortcut would be included in the Windows Installer package that is built from this InstallShield project.

Deleting a shortcut—When you delete a shortcut, it is removed from both the App-V package and the InstallShield project. This means that the shortcut would also be deleted from the Windows Installer package that is built from this InstallShield project.

Renaming a Shortcut

Task To rename a shortcut:

1. In the Microsoft App-V Assistant, open the Applications page.
2. Select the shortcut that you want to rename and click Rename.
3. Enter a new name for the shortcut.

Modifying App-V Package Registry Settings

Using the Microsoft App-V Assistant, you can view existing registry keys, values, and data, and add or delete registry items in your App-V package.

You can also set isolation options for selected registry keys. Isolation options specify how the isolation environment will provide access to system resources requested by the application.

Information about modifying registry settings on the Registry page includes the following topics:

- About the Windows Registry
- Adding or Deleting Registry Keys and Values

About the Windows Registry

The Windows registry is a system-wide database that contains configuration information used by applications and the operating system. The registry stores all kinds of information, including the following:

- Application information such as company name, product name, and version number
- Path information that enables your application to run
- Uninstallation information that enables end users to uninstall the application easily without interfering with other applications on the system
- System-wide file associations for documents created by an application
- License information
- Default settings for application options such as window positions

Keys, Value Names, and Values

The registry consists of a set of keys arranged hierarchically under the My Computer explorer. Just under My Computer are several root keys. An installation can add keys and values to any root key of the registry. The root keys that are typically affected by installations are:

- HKEY_LOCAL_MACHINE
- HKEY_USERS
- HKEY_CURRENT_USER
- HKEY_CLASSES_ROOT

A key is a named location in the registry. A key can contain a subkey, a value name and value pair, and a default (unnamed) value. A value name and value pair is a two-part data structure under a key. The value name identifies a value for storage under a key, and the value is the actual data associated with a value name. When a value name is unspecified for a value, that value is the default value for that key. Each key can have only one default (unnamed) value.
Note that the terms key and subkey are relative. In the registry, a key that is below another key can be referred to as a subkey or as a key, depending on how you want to refer to it relative to another key in the registry hierarchy.

Adding or Deleting Registry Keys and Values

Editing the registry on the Registry page is performed much like it is performed in the InstallShield Registry view. To learn more, see Editing the Registry.

See Also
About the Windows Registry

Setting App-V Package Registry Isolation Options

The Microsoft App-V Assistant enables you to configure isolation options for a registry key.

Important • Although you cannot explicitly set an isolation option for a registry value, registry values are subject to the isolation options of their keys.

Task

To configure an isolation option for a registry key:

1. In the Microsoft App-V Assistant, open the Registry page.
2. Right-click the key that you would like to configure and then click Isolation Options. The Options dialog box opens.
3. Select one of the following options:
   - Merge with local key—The App-V package sees a merged view of the registry entries for the selected key from both the local registry and from the App-V package’s registry.
   - Override local key—The App-V package sees only the registry entries for the selected key that are part of that App-V package.
4. Click OK.

Registry keys that have an override isolation option are marked with a special icon.
Tip • To launch the Registry Import Wizard and import an existing registry (.reg) file, click the Import a .reg file option in the More Options area on the Registry page.

Inheritance of Isolation Options in the Registry

Isolation options for registry keys are always inherited. The isolation environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for the Microsoft registry key and one for Microsoft\Windows registry key. When the application requests Microsoft\Windows\CurrentVersion, then the Microsoft\Windows isolation rule will be applied because Microsoft\Windows is a more specific reference to Microsoft\Windows\CurrentVersion than is Microsoft.

Figure 12-6: Example of Inheritance of Isolation Options from Folders to Files

Setting App-V Package Registry Isolation Options

Performing Dynamic Suite Composition

Version • This information applies to App-V 4.x packages.
A virtual package may rely on one or more other virtual packages in order to function properly. The Microsoft App-V Assistant lets you specify other App-V packages that the open App-V package (the primary package) requires. This capability, called *Dynamic Suite Composition*, enables your virtual package to interact with the other virtual applications in the virtual environment. Dynamic Suite Composition enables you to deploy common system components once on each client system, making them available for use by many App-V packages, rather than requiring you to include them with each of the App-V packages that are dependent on them. This reduces redundancy in the local App-V cache and simplifies the construction and testing of the primary virtual application.

To specify App-V packages that you want to include in a dynamic suite, use the Dynamic Suite Composition page of the Microsoft App-V Assistant.

**Task**

**To add one more dependencies to your App-V package:**

1. In the Microsoft App-V Assistant, open the Dynamic Suite Composition page.
2. To add a dependency App-V package, click the New button. The Open dialog box opens.
3. Open the directory where the dependency App-V package that you want to add is located. That application’s .osd and .sft files are listed.
4. Select one of the following:
   - **One of the .osd files**—If this dependency App-V package is or is going to be published on a server, select any one of the .osd files that are listed. If these .osd files were created properly, each of them should contain the information that will identify to the primary App-V package the published location of the dependency App-V package.
   - **The .sft file**—If this dependency App-V package is or is going to be published locally on the client or at an accessible network location, you may select just the .sft file.

The selected App-V package is now listed in the Dependency Applications list and, by default, the Mandatory option is selected.

5. Set the status of the selected App-V package by doing one of the following:
   - **If the dependency App-V package is mandatory**—If the primary App-V package will not run unless it can locate this dependency App-V package, leave the Mandatory option selected. If a dependency App-V package that is configured as mandatory is not available, an error will be generated when someone attempts to run the primary App-V package.
   - **If the dependency App-V package is not mandatory**—If the primary App-V package will run even if it cannot locate this dependency App-V package, clear the Mandatory option.

6. Build the primary App-V package.

**Deleting a Dependency Application from the List**

To remove an App-V package from the Dependency Applications list, select the application and click the Delete button.
Modifying Build Options

AdminStudio 2019 | Microsoft App-V Assistant

On the Build Options page, specify for which releases of this InstallShield project you want to build an App-V package, and specify whether you want to include additional Windows Installer packages in the virtual package.

Also, if you are editing a Windows Installer package in Direct Edit mode (or Direct MST mode), you need to select the Build App-V 5.x package check box or the Build App-V 4.x package check box on the Build Options page before you will be able to build an App-V package for that Windows Installer package.

Important • You must create at least one release (in the Releases view of the Installation Designer) before you can select a release on the Build Options page.

Selecting the Releases for Which You Want to Build App-V Packages

AdminStudio 2019 | Microsoft App-V Assistant

You select the releases that you want to build an App-V package for on the Releases tree of the Build Options page.

Important • You cannot create or edit a release in the Microsoft App-V Assistant. If no releases exist, you can simply click the Build toolbar button to create a new release or open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build an App-V package. For more information, see Creating and Building Releases.

If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the Releases tree on the Build Options page is not displayed.

To select releases to build:

1. In the Microsoft App-V Assistant, open the Build Options page.
2. Select the releases in the Releases tree that you want to build an App-V package for.

Important • When you select a release on the Build Options page, you are specifying that whenever you build that particular release, you want to also build an App-V package for that release. However, the releases that are selected on the Build Options page have no bearing upon which release is built when you click the Build button on the toolbar. When you initiate a build by clicking the Build button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer Releases view. The output of that build would depend upon what releases were selected on the Build Options page:
   - Active release selected—A Windows Installer package and an App-V package would be built.
   - Active release not selected—Only a Windows Installer package would be built.
Note • To build more than one release at a time, perform a batch build. See Performing Batch Builds.

Build Options Page

Enabling App-V Package Building When in Direct Edit Mode

AdminStudio 2019 | Microsoft App-V Assistant

When you are editing a Windows Installer (.msi) package or a transform (.mst) file in the Microsoft App-V Assistant, you are in Direct Edit Mode or Direct MST Mode. Because you are directly editing a Windows Installer package, you save your changes by selecting Save on the File menu. It is not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled.

However, you do need to run the build process to build an App-V package for this Windows Installer package. To do this, perform the following steps:

Task  To enable App-V package building when in Direct Edit Mode:

1. Open a Windows Installer package or a transform file in InstallShield. It will be opened in Direct Edit Mode or Direct MST Mode, and the Build function (Build on the Build menu and the Build toolbar button) will be disabled.

2. In the Microsoft App-V Assistant, open the Build Options page.

3. Select the Build App-V 5.x package check box or the Build App-V 4.x package check box.

The Build toolbar button is enabled.

Specifying Whether to Compress the Data Files in an App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

Version • This information applies to App-V 4.x packages.

InstallShield lets you specify whether you want to use zlib compression for the data files in the App-V package.

Task  To specify whether to compress the data files in the App-V package:

1. In the Microsoft App-V Assistant, open the Build Options page.

2. Specify the appropriate option for the Would you like to compress the data in the virtual package? option.
Including Additional Windows Installer Packages in an App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. In addition to being able to convert a single Windows Installer package to a virtual package, you can also use the Microsoft App-V Assistant to convert an application suite of multiple Windows Installer packages into one virtual package.

To include additional Windows Installer packages in an App-V package, set the **Would you like to include additional MSI files in the virtual package?** option on the Build Options page to Yes, and then select the packages that you want to add.

**Task** To include additional Windows installer packages in an App-V package:

1. In the Microsoft App-V Assistant, open the Build Options page.
2. Set the **Would you like to include additional MSI files in the virtual package?** option to **Yes**.
3. Click the Open button and select the Windows Installer packages that you want to add. After each file is selected, it will be listed in the **Windows Installer Files (.msi)** list.
   - The order of the packages can be changed by selecting a package in the list and clicking the Move Up (↑) and Move Down (↓) buttons.
   - Use the Delete button (❌) to delete a package from the list.

Building a Windows Installer Package to Assist in the Distribution of an App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

You can choose to build a Windows Installer package to assist in the distribution of an App-V package. This simplifies the deployment of an App-V package by enabling you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management.

To build a Windows Installer package with your App-V package, select the **Generate an installation package as part of the build output** check box on the Advanced Settings dialog box. You can access this dialog box by clicking the Advanced Settings link in the More Options area on the Build Options page of the Microsoft App-V Assistant. By default, this check box is not selected.

When you run this Windows Installer file, the minimally required App-V package files will be “installed” in the local App-V client system cache. (The App-V package files remain on the App-V server until the client requests that they be downloaded when the application is launched for the first time.)

**Note** • The App-V client must be installed on the local machine before you can install an App-V package. The installation will detect and warn if the App-V client is not available, and the installation will fail.

To remove an installed App-V package, you need to use the Application Virtualization Client tool, which is available in the Administrative Tools of the Windows Control Panel.
Specifying Package Feature Block Optimizations

AdminStudio 2019 | Microsoft App-V Assistant

You can use the package optimization to control the performance and network traffic that is associated with running an App-V package. The package optimization support you select determines how quickly the App-V package launches, and how often additional functionality needs to be streamed to the client while the App-V package is being used.

The files in an App-V package can be grouped into two feature blocks:

- **Feature block 1**—Feature block 1 must contain the core functionality of the App-V package that is necessary to launch the application. At application launch, all of the files in feature block 1 are streamed to the client in one unit.

- **Feature block 2**—Feature block 2 can contain additional functionality of the App-V package that is not necessary to launch the application. While the App-V package is being used, the files in feature block 2 can be streamed in small packets on an as-needed basis.

You can either choose to include all App-V package files in feature block 1 or, to improve launch speed, you can choose to group the files into two feature blocks: feature block 1 and feature block 2.

You indicate your package optimization preference on the Package Optimizations dialog box, which is opened by clicking the Package Optimizations link in the More Options area on the Build Options page.

The Package Optimizations dialog box includes the following options:

<table>
<thead>
<tr>
<th>Table 12-6 • Package Optimizations Options</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Option</strong></td>
</tr>
<tr>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Optimize for Streaming</td>
</tr>
</tbody>
</table>

**Note** • When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent use of the application.

| Optimize for Offline Use | If you choose this option, all files in the App-V package will be included in feature block 1 and will be streamed to the client at startup in one file before the application launches. After that, no more streaming is done. All files are stored in the App-V cache, which means that the application is available for use even when the machine is not connected to the App-V server. Select this option if you want to enable end users to use the App-V package when not connected to the App-V server and if you want to eliminate network traffic when the App-V package is being used. |

**Note** • When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent application use.
Building an App-V Package

AdminStudio 2019 | Microsoft App-V Assistant

The method for App-V package depends upon what file you have open in InstallShield—an InstallShield project or a Windows Installer package.

Building an App-V Package from Within an InstallShield Project

To build an App-V package from within an InstallShield project, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To build an App-V package for an InstallShield project:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the InstallShield project in InstallShield.</td>
</tr>
<tr>
<td>2.</td>
<td>On the Releases view of the Installation Designer, make sure that at least one release has been created, and select the release that you want to build.</td>
</tr>
</tbody>
</table>

**Important** - You cannot create or edit a release in the Microsoft App-V Assistant. If no releases exist, or if you want to create a new release, open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build an App-V package. For more information, see Creating and Building Releases.

| 3.   | In the Microsoft App-V Assistant, open the Build Options page. |
| 4.   | In the Releases tree, select the same release that is selected on the Releases view of the InstallShield Installation Designer. This is the release that you will build an App-V package for. |
| 5.   | Click the Build toolbar button (or select Build Release on the Build menu) to start building the active release. |

**Important** - When you select a release on the Build Options page, you are specifying that whenever you build that particular release, you want to also build an App-V package for that release. However, the releases that are selected on the Build Options page have no bearing upon which release is built when you click the Build button on the toolbar. When you initiate a build by clicking the Build button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer Releases view. The output of that build would depend upon what was selected on the Build Options page:

- **Active release selected** — A Windows Installer package and an App-V package would be built.
- **Active release not selected** — Only a Windows Installer package would be built.

To learn how to build more than one release at a time, see Performing Batch Builds.

Building an App-V Package from Within a Windows Installer Package in InstallShield

To build an App-V package for a Windows Installer package, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To build an App-V package for a Windows Installer package:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Do one of the following to open a Windows Installer package:</td>
</tr>
<tr>
<td></td>
<td>- On the File menu, select Open and select a Windows Installer package (.msi).</td>
</tr>
</tbody>
</table>
Chapter 12  Creating Customized Virtual Applications
Creating Microsoft App-V Packages

On the File menu, select Open and select a transform file (.mst). The Open Transform Wizard opens and you are prompted to identify the transform file’s associated Windows Installer package.

On the File menu, select New to open the New Project dialog box. Select Transform and click OK. The Open Transform Wizard opens and you are prompted to identify the transform file’s associated Windows Installer package.

2. Use the Installation Designer to make any desired edits to the Windows Installer package or Transform file, and use the Microsoft App-V Assistant to set App-V package options.

3. On the File menu, click Save.

4. In the Microsoft App-V Assistant, open the Build Options page.

5. Select the Build App-V 5.x package check box or the Build App-V 4.x package check box. The Build Virtual Package button is enabled.

6. Click the Build Virtual Package button.

See Also
Build Output for App-V Packages

Build Output for App-V Packages

Version  •  Some functionality is specific to particular versions of App-V packages. Version-specific differences are noted where appropriate.

Location of the Build Output

If you build an App-V 5.x package, InstallShield saves the App-V output in the following directory path:

App-VPackage\ProductName

If you build an App-V 4.x package, InstallShield saves the App-V output in the following directory path:

App-VPackage\ProductName_vN

The version number (N) of the App-V 4.x package is appended to the end of that folder path. Each time that you build an upgrade, InstallShield creates a new subfolder and increments the version number in the name of the subfolder.

The default location of the App-VPackage folder depends on whether you are building an App-V 5.x or 4.x package from within an MSI Database project or a Basic MSI project:

• If you are building an App-V package from within an MSI Database project (.msi file), InstallShield creates the App-VPackage folder in the same folder as the .msi file.

• If you are building an App-V package from an .ism file, InstallShield creates the App-VPackage folder in the following location:
  
  InstallShield Project Folder\ProjectName\Product Configuration\Release Name\DiskImages\Disk1

Contents of the Build Output

If you are building an App-V package from within InstallShield, the output of the build consists of the following:
Creating Microsoft App-V Packages

- An App-V package—For information on the files that are included in an App-V package, see Components of an App-V Package.

- A Windows Installer–based installation—Note that this is built only if you are building an App-V package from within a Basic MSI project. If you are building an App-V package from within an MSI Database project in InstallShield, InstallShield does not build this file.

- A new Basic MSI project that assists in the distribution of the App-V package—This is built if you choose to generate an installation package as part of the build process.

AdminStudio creates the new Basic MSI project in the release folder. Note the following details about this project:

- The project contains dynamic file links to the App-V package files.

- The properties and directories are updated in the project.

- The Releases view contains four or more releases that enable you to build different combinations of releases (for example, compressed or uncompressed, with or without an InstallShield prerequisite for the App-V client).

- A built release is also included with the new Basic MSI project. Any warnings or errors from this build are included as warning -9150 or error -9151 in the App-V project.

- You can use this project if you want to add more functionality to your Windows Installer package. For example, you can create major upgrades, digitally sign the package, and more.

- You can update the end-user license agreement (EULA) with your own custom EULA. The EULA that is included by default contains instructions that explain how to replace the default EULA text with your own EULA text.

- This project is overwritten each time that you rebuild your App-V project.

Note • For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see Virtualization Conversion Errors and Warnings.

Building App-V Packages Through the Command Line

AdminStudio 2019 | Microsoft App-V Assistant

When you configure an App-V package in an InstallShield project and then build that project (using either the user interface or the command line), both the Windows Installer package and the App-V package are built. When you use the standard InstallShield command-line build, you do not need to add any additional command-line parameters. All of the App-V package settings are saved within the InstallShield project.

Testing an App-V Package Using the App-V Launcher Tool

AdminStudio 2019 | Microsoft App-V Assistant

You can use the App-V Launcher tool to locally test a newly built App-V package before moving it to a deployment server.

To open the App-V Launcher tool, click Test launch the App-V package in the More Options area on the Build Options page. The App-V Launcher will attempt to launch that application. If there are multiple shortcuts in this App-V package, the Launch App-V Package dialog box opens, where you are prompted to select the shortcut that you want to launch from a list of all of the shortcuts.
Requirements for Using the App-V Launcher Tool

The machine on which you use the App-V Launcher to test an App-V package must meet the following requirements:

- The Microsoft Application Virtualization Client must be installed.
- The version of the Microsoft Application Virtualization Client that is present should be equal to or newer than the minimum client version of the App-V package.
- File streaming must be enabled because the App-V Launcher publishes the App-V package from a local file path. If file streaming is not enabled, the App-V Launcher displays an informative message asking if it can enable this functionality.

App-V Launcher Tool Location

When an App-V package is built, the App-V Launcher tool (AppVLauncher.exe) is placed in the same folder as the App-V package.

How the App-V Launcher Tool Works

In order to make it possible to test the App-V package without having to publish it on the server, a copy of the App-V Launcher tool is automatically copied to the output directory of each App-V package. The App-V Launcher looks for the .appv or .sft file that is located in the same directory.

Note • The first time that you use the App-V Launcher to run an application in an App-V package, the entire package is published to that machine; this includes all of the package’s shortcuts and file extension associations in the package. If you then use the App-V Launcher to run any application in the App-V package again, the App-V Launcher unpublishes the package (and its shortcuts and file extension associations) before republishing the package.

Also note that the AppVLauncher.exe file requires elevation. If you want to be able to test your App-V package in a locked-down environment where end users will not have elevated privileges, you may want to use the App-V Launcher once to launch and publish your App-V package with elevated privileges. Once you have done that, you can use the published shortcuts and file extension associations to start your application.

The App-V Launcher is a convenient testing tool that makes it possible for you to reliably and accurately test your App-V packages on your local machine or any other system that has the App-V client installed before moving it to the App-V server.

See Also
Launch App-V Package Dialog Box

Troubleshooting the Builds of App-V Packages

For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see Virtualization Conversion Errors and Warnings.
Application Features that Require Pre- or Post-Conversion Actions

Some application features are ignored when an App-V package is created. Therefore, some additional pre- or post-conversion actions must be taken in order for the App-V package to be created properly.

One action you could take to try to include ignored features in an App-V package is to first repackaging the application using the Repackaging Wizard, and then convert the repackaged application to an App-V package.

For a list of ignored features, see Application Features Requiring Pre- or Post-Conversion Actions.

Microsoft App-V Assistant Reference

Reference information about the Microsoft App-V Assistant is organized into the following sections:

- Microsoft App-V Assistant Pages
- Microsoft App-V Assistant Dialog Boxes

Microsoft App-V Assistant Pages

The Microsoft App-V Assistant is comprised of the following pages:

- Microsoft App-V Assistant Home Page
- Package Information Page
- Files Page
- Applications Page
- Registry Page
- Dynamic Suite Composition Page
- Build Options Page

Microsoft App-V Assistant Home Page

The Microsoft App-V Assistant Home page displays a diagram that illustrates the process of creating an App-V package.
Click the following icons in the navigation bar at the bottom of the page to navigate through the Microsoft App-V Assistant interface:

**Table 12-7 • Navigation Bar Icons**

<table>
<thead>
<tr>

</tbody>
</table>
Creating Microsoft App-V Packages

Chapter 12  Creating Customized Virtual Applications

Protocol App-V 4.x
Select the protocol that you want to use to stream the sequenced application package from the virtual application server to an Application Virtualization Client. Available options are:

- **RTSP**—The real-time streaming protocol streams the App-V package. This is the default option.
- **RTSPS**—The real-time streaming protocol with transport layer security streams the App-V package.
- **FILE**—The App-V package are streamed from a file share.
- **HTTP**—The hypertext transport protocol streams the App-V package.
- **HTTPS**—The secure hypertext transport protocol streams the App-V package.

Host App-V 4.x
Specify the host—the virtual application server or the load balancer in front of a group of virtual application servers that stream the App-V package to the Application Virtualization Client. You can either specify a static host name or IP address, or you can enter %SFT_SOFTGRIDSERVER% to indicate an environment variable.

Note • If you enter %SFT_SOFTGRIDSERVER%, you must set up the SFT_SOFTGRIDSERVER system environment variable on each Application Virtualization Client. The value of this environment variable should be the name or IP address of the host.

When you assign the variable on a client system, any Application Virtualization Client session that is running on the system must be closed and reopened; otherwise, the session is not aware of the new application source.

Port App-V 4.x
Specify the port on which the virtual application server or the load balancer listens for Application Virtualization Client requests for the package. The default port is 554.

Path App-V 4.x
Specify the relative path on the virtual application server where the App-V package is stored. This is also the path from which the App-V package is streamed.

If the App-V package is stored in a subdirectory of CONTENT, the path must be specified in this setting; otherwise, you can leave this setting blank.

- Specifying Package Information
- Including Diagnostic Tools in an App-V Package

Files Page
AdminStudio 2019 | Microsoft App-V Assistant

Use the Files page of the Microsoft App-V Assistant to perform tasks such as the following:
- View the files and folders in the App-V package
- Add or remove files and folders in the App-V package
- Set isolation options

Tip • You can specify which of the Windows Installer predefined folders are listed in the Microsoft App-V package tree. To learn how, see Controlling the Display of Predefined Folders.

See Also
- Adding, Deleting, and Moving Files and Folders in an App-V Package

Applications Page
AdminStudio 2019 | Microsoft App-V Assistant

Shortcuts provide the most visible entry points for launching the applications in the App-V package. Most App-V packages should have at least one shortcut.

On the Applications page of the Microsoft App-V Assistant, you can define application shortcuts to enable end users to launch an application in the App-V package. The Microsoft App-V Assistant creates shortcuts for any executable files that are added through the Files page. All shortcuts are added to the App-V package and published to the system when the package is published.

For more information, see the following:
- Creating a New App-V Package
- Including an Existing App-V Shortcut
Registry Page

On the Registry page, you can view existing registry keys, values, and data, and add or delete registry items. You can also override the default isolation options for a registry key. Isolation options specify how the virtual environment will provide access to system resources requested by the application.

The default settings for isolation options are built into the Microsoft App-V Assistant, and those defaults are adequate for most environments. However, you can override the default settings for selected registry keys to exert control over application interactions with client operating system resources. For an overview of the available isolation options, and for instructions on how to set them, see Setting App-V Package Registry Isolation Options.

Registry items that are listed on this page will be included in the App-V package, and those that you delete will not. By default, all new registry keys are isolated.

Tip • To launch the Registry Import Wizard and import an existing registry (.reg) file, click the Import a .reg file option in the More Options area on the Registry page.

Note • You cannot set isolation options on root registry keys.

Editing the registry on the Registry page is performed much like it is performed in the InstallShield Registry view. To learn more, see Editing the Registry.

Important • While you cannot explicitly set an isolation option on a registry value, registry values are subject to the isolation options of their keys.

About the Windows Registry
Adding or Deleting Registry Keys and Values

Dynamic Suite Composition Page

A virtual package may rely on one or more other virtual packages in order to function properly. The Microsoft App-V Assistant lets you specify other App-V packages that the open App-V package (the primary package) requires. This capability, called Dynamic Suite Composition, enables your virtual package to interact with the other virtual applications in...
the virtual environment. Dynamic Suite Composition enables you to deploy common system components once on each client system, making them available for use by many App-V packages, rather than requiring you to include them with each of the App-V packages that are dependent on them. This reduces redundancy in the local App-V cache and simplifies the construction and testing of the primary virtual application.

To specify App-V packages that you want to include in a dynamic suite, use the Dynamic Suite Composition page of the Microsoft App-V Assistant.

The following settings are available on the Dynamic Suite Composition page.

**Table 12-9 • Dynamic Suite Composition Page**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependency App-V</td>
<td>List of all of the dependency App-V packages that have been selected for the primary App-V package.</td>
</tr>
<tr>
<td>Packages</td>
<td></td>
</tr>
<tr>
<td>Mandatory</td>
<td>Indicates whether to selected dependency App-V package is required in order for the primary App-V package to run.</td>
</tr>
<tr>
<td></td>
<td>• <strong>If the dependency App-V package is mandatory</strong>—If the primary App-V package will not run unless it can locate this dependency App-V package, leave the Mandatory option selected. If a dependency App-V package that is configured as Mandatory is not available, an error will be generated when someone attempts to run the primary App-V package.</td>
</tr>
<tr>
<td></td>
<td>• <strong>If the dependency App-V package is not mandatory</strong>—If the primary App-V package will run even if it cannot locate this dependency App-V package, clear the Mandatory option.</td>
</tr>
<tr>
<td>New Button</td>
<td>To add an App-V package to the Dependency App-V Packages list, click this button and select the App-V package (.osd, .sft) that you want to add. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>One of the .osd files</strong>—If this dependency App-V package is or is going to be published on a server, select any one of the .osd files that are listed. If these .osd files were created properly, each of them should contain the information that will identify to the primary App-V package the published location of the dependency App-V package.</td>
</tr>
<tr>
<td></td>
<td>It is not necessary to select more than one .osd file. All of them contain the same reference to the location of the dependency App-V package's .sft file, which is the only reference that is necessary in order for the primary App-V package to locate it.</td>
</tr>
<tr>
<td></td>
<td>• <strong>The .sft file</strong>—If this dependency App-V package is or is going to be published locally on the client or at an accessible network location, you may select just the .sft file.</td>
</tr>
<tr>
<td></td>
<td>The selected reference App-V package is now listed in the Dependency Applications list and, by default, the Mandatory option is selected.</td>
</tr>
<tr>
<td>Delete Button</td>
<td>Click to delete the selected App-V package from the list.</td>
</tr>

</thead>
<tbody>
<tr>
<td>Generate an installation package as part of the build output</td>
<td>App-V 4.x, App-V 5.x</td>
<td>To build an installation package with your App-V package, select this check box. This check box is not selected by default. If you do select this check box, you can specify whether you want to load the installation package from the media location or from the shared location. Building an installation package enables you or your end users to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management to distribute your App-V package. When you run this Windows Installer file, the minimally required App-V package files will be “installed” in the local App-V client system cache. (The .sft file remains on the App-V server until the client requests that it be downloaded when the application is launched for the first time.)</td>
</tr>
<tr>
<td>Load from Media Location</td>
<td>App-V 4.x</td>
<td>To load the installation package from the media location, select this option.</td>
</tr>
<tr>
<td>Compress</td>
<td>App-V 4.x, App-V 5.x</td>
<td>To build a compressed installation package, select this check box. If this check box is cleared, an uncompressed installation package is built.</td>
</tr>
</tbody>
</table>

**Note** • The App-V client must be installed on the local machine before you can install an App-V package. The installation will detect and warn if the App-V client is not available, and the installation will fail.

To remove an installed App-V package, you need to use the Application Virtualization Client tool, which is available in the Administrative Tools of the Windows Control Panel.

Some settings apply to particular versions of App-V packages. Version-specific differences are noted where appropriate.
Chapter 12  Creating Customized Virtual Applications

Creating Microsoft App-V Packages

App-V Diagnostic Tools Dialog Box

AdminStudio 2019 | Microsoft App-V Assistant

Version • The diagnostic tools are available for App-V 4.x packages. Starting with App-V 5.x, it is no longer necessary to inject diagnostic tool shortcuts directly into the package. The App-V Launcher tool is capable of launching a Command Prompt window within the virtual environment of an App-V 5.x package.

On the Diagnostic Tools dialog box, which is opened by selecting Diagnostic Tools in the More Options area on the Package Information page, you can choose to include the Registry Editor and Windows Command Prompt diagnostic tools with your App-V package.

If you include diagnostic tools with your App-V package, you will be able to look at the registry or file system for the application while it is running in its virtual environment. For example, if you were running an App-V package and you encountered an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

The Registry Editor diagnostic tool lets you use Regedt32.exe on the local machine and have access to the virtual environment. The Command Prompt diagnostic tool lets you use Cmd.exe on the local machine and have access to the virtual environment.

Launching the Diagnostic Tools Within the Virtual Environment

If you selected the Registry Diagnostics or File System Diagnostics options on the Diagnostic Tools dialog box, shortcuts to those tools are automatically added to the App-V package.

When an end user runs this App-V package, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:

[ProductName] Registry
[ProductName] File System

When an end user launches one of these shortcuts, that diagnostic tool is launched inside the context of the application’s virtual environment.
App-V Package Upgrade Settings Dialog Box

Some settings apply to particular versions of App-V packages. Version-specific differences are noted where appropriate.

The App-V Package Upgrade Settings dialog box is where you specify whether you want to create an upgrade for your App-V package. If you specify that you do want to create an upgrade, you can specify additional information about the upgrade.

Table 12-13 • App-V Package Upgrade Settings Dialog Box Settings

<table>
<thead>
<tr>

<tr>
<td>Enable Upgrade</td>
<td>App-V 4.x, App-V 5.x</td>
<td>To create an upgrade for an earlier App-V package, select this check box. If you do not want to create an upgrade, clear this check box. When this check box is cleared, the other settings on the App-V Package Upgrade Settings dialog box are disabled. This check box is cleared by default.</td>
</tr>
<tr>
<td>Always upgrade latest built package</td>
<td>App-V 4.x</td>
<td>If you selected the Enable Upgrade check box and you want InstallShield to build an upgrade that updates the latest built App-V package, select this option.</td>
</tr>
<tr>
<td>Choose package to upgrade</td>
<td>App-V 4.x, App-V 5.x</td>
<td>If you selected the Enable Upgrade check box and you want InstallShield to build an upgrade that updates a particular App-V package, select this option, and then specify the path of the earlier package that you want to be updated.</td>
</tr>
<tr>
<td>Previous package to upgrade</td>
<td>App-V 5.x</td>
<td>If you selected the Enable Upgrade check box and you want InstallShield to build an upgrade that updates a particular App-V package, select this option, and then specify the path of the earlier package that you want to be updated.</td>
</tr>
<tr>
<td>Append version number to package name</td>
<td>App-V 4.x, App-V 5.x</td>
<td>If you selected the Enable Upgrade check box and you want InstallShield to append the version number to the App-V package name, select this check box.</td>
</tr>
</tbody>
</table>
Chapter 12  Creating Customized Virtual Applications
Creating Microsoft App-V Packages

File Mapping Dialog Box

The File Mapping dialog box lets you specify how you want to store the files in your App-V package. It also lets you indicate whether you want to allow write access to the virtual file system.

To launch the File Mapping dialog box, click the File Mapping link in the More Options area on the Files page. This dialog box displays the current primary application directory setting (if one has already been specified).

The following settings are available on the File Mapping dialog box.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Specify how files are stored in this package** | Select the appropriate option:  
  * **Map all files into the virtual file system (VFS)**—This option matches the behavior that was introduced in the Sequencer for App-V 5 SP3. This support is available for App-V 4.x and 5.x packages.  
  * **Specify a primary application directory. Files and folders that are descendants of this directory will be mapped to the root folder**—To use a primary application directory, select this option and then optionally specify the application directory that contains most of the files in the App-V packages.  
To specify the application directory, click the ellipsis button (...). When you do so, the Browse for Directory dialog box opens, listing all of the currently available destination directories for this App-V package.  
If you leave the application directory field blank, the directory is determined automatically at run time. To learn how, see **Specifying the Primary Application Directory**.  
At run time when the App-V package is loaded, the directory and its contents are mounted to the App-V virtual drive.  
This is the default option. |

| Allow full write permission to the VFS | If you want an App-V 5.x package that you are creating to have full write permissions to the virtual file system (VFS), select this check box. Selecting this check box may be useful for sequencing third-party applications. |

Isolation Options Dialog Box (for a Package)

Use the Isolation Options dialog box to configure advanced settings for COM isolation and named object isolation. This support is available for App-V 5.x packages.

To access the Isolation Options dialog box, click the Isolation Settings link in the More Options area on the Package Information page.
The following settings are available on the Isolation Options dialog box.

**Table 12-15 • Isolation Options Dialog Box**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COM isolation</td>
<td>Select the appropriate option:</td>
</tr>
<tr>
<td></td>
<td>• Isolate COM objects from the local system</td>
</tr>
<tr>

<td>• Allow COM objects to interact with the local system</td>
</tr>
<tr>
<td>Named object isolation</td>
<td>Select the appropriate option:</td>
</tr>
<tr>
<td></td>
<td>• Isolate named objects from the local system</td>
</tr>
<tr>
<td></td>
<td>• Allow all named objects to interact with the local system</td>
</tr>
</tbody>
</table>

**Isolation Options Dialog Box (for Registry Keys)**

AdminStudio 2019 | Microsoft App-V Assistant

Use the Isolation Options dialog box to specify whether the App-V package should see only the registry entries for the selected key that are part of that App-V package, or see a merged view of the registry entries for the selected key from both the local registry and from the App-V package’s registry.

To open the Isolation Options dialog box, right-click a registry key on the Registry page and then click Isolation Options.

⚠️ **Caution** • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects and registry settings.

Use the Isolation Options dialog box to select one of the following options:

**Table 12-16 • Options on the Isolation Option Dialog Box**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Merge with local key</td>
<td>The App-V package sees a merged view of the registry entries for the selected key from both the local registry and from the App-V package’s registry.</td>

### Package Optimizations Dialog Box

The Package Optimizations dialog box enables you to specify your preference for control of performance and network traffic that is associated with running an App-V package. The package optimization option that you select determines how quickly the App-V package launches, and how often additional functionality needs to be streamed to the client while the App-V package is being used.

The Package Optimizations dialog box opens when you click the Package Optimizations link in the More Options area on the Build Options page.
Use the Package Optimizations dialog box to select one of the following options:

**Table 12-19 • Package Optimizations Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optimize for Streaming</td>
<td>the Microsoft App-V Assistant performs a static analysis of the shortcuts in the application and decides which files should be in feature block 1 and which should be in feature block 2. This option provides a relatively quick launch time while limiting network traffic during application use.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent use of the application.</td>
</tr>
<tr>
<td>Optimize for Offline Use</td>
<td>All files in the App-V package are included in feature block 1. All of the files are streamed to the client at start up in one file before the application launches. After that, no more streaming is done. All files are stored in the App-V cache, which means that the application is available for use even when the machine is not connected to the App-V server. If you want to enable end users to use the App-V package when the target system is not connected to the App-V server, and if you want to eliminate network traffic when the App-V package is being used, select this option.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When application files are streamed to a client either at launch or during application use, they are saved in the App-V cache and do not need to be streamed again during subsequent application use.</td>
</tr>
</tbody>
</table>

For more information, see Specifying Package Feature Block Optimizations.

**Advanced Table Settings for Conversion to Microsoft App-V**

**AdminStudio 2019**

You can customize your virtual conversion process in the following ways:

- **Per package**—You can use InstallShield to directly edit the ISIvirtualPackage table to modify the settings referenced below. You can also use the App-V Assistant user interface to modify the settings.

- **Globally for any conversion**—You can edit the Settings.xml file to specify default values for many of the settings that can be specified in the ISIvirtualPackage table.

In addition to editing the ISIvirtualPackage table, you can also edit other tables (directory, file, registry, shortcut) that store App-V conversion settings related to a particular item in the package, such as a particular shortcut, file, registry entry, or directory.

Information about customizing table settings for your App-V conversion process are organized into the following sections:

- **ISVirtualPackage Table**
• ISVirtualRelease Table
• ISVirtualDirectory Table
• ISVirtualFile Table
• ISVirtualRegistry Table
• ISVirtualShortcut Table
• Miscellaneous Virtual Conversion Settings
• Editing the Settings.xml File

Note • If you want to modify the setting in the ISVirtualPackage table globally, you can edit the Settings.xml file, as described in Editing the Settings.xml File. However, the settings in the ISVirtualDirectory, ISVirtualFile, ISVirtualRegistry, and ISVirtualShortcut tables cannot be specified in the Settings.xml file.

ISVirtualPackage Table

The ISVirtualPackage table is the main table that stores package-wide conversion settings. To edit this table, open the package in InstallShield and open the Direct Editor view. Also, if you make selections in the InstallShield Assistants, it will modify the settings in this table.

The following are App-V settings in the ISVirtualPackage table.

Table 12-20 • App-V Settings in ISVirtualPackage Table

Chapter 12  Creating Customized Virtual Applications

Creating Microsoft App-V Packages

Table 12-20 • App-V Settings in ISVirtualPackage Table

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Default</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VirtualPackageBuildOutputFolder</td>
<td>Absolute path to a directory</td>
<td></td>
<td>Instead of creating the converted virtual applications in a folder next to the source MSI, put them in a new folder under this specified location - this overrides the global redirect option in settings.xml.</td>
</tr>
</tbody>
</table>

Note • If you want to modify these settings globally, you need to edit the Settings.xml file, as described in Editing the Settings.xml File.

ISVirtualRelease Table

The ISVirtualRelease table stores the relationship between InstallShield project releases and the virtual package type you want to build. This table is only relevant when you are editing an InstallShield Basic MSI project (not when you are editing an MSI package in the DirectEdit mode). If you make the relevant selections in the Assistants, it will modify the settings in this table.

Note • The settings in this table cannot be specified in the Settings.xml file.

Table 12-21 • General Settings in ISVirtualRelease Table

<table>
<thead>
<tr>
<th>ISRelease_</th>
<th>ISProductConfiguration_</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

<tr>
<th>ISRelease_</th>
<th>ISProductConfiguration_</th>
<th>Provider</th>
<th>Semicolon separated list of Thinstall, AppV, and Citrix</th>
<th>Indicates virtual technologies to which to convert MSI packages</th>
</tr>
</thead>
</table>
**ISVirtualDirectory Table**

The following are App-V settings in the ISVirtualDirectory table.

**Table 12-22 • App-V Settings in ISVirtualDirectory Table**

<table>
<thead>
<tr>
<th>Directory</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into Directory table</td>
<td>AppVUserData</td>
<td>1</td>
<td>If set, then treat this directory as user data. If unspecified, then default algorithm is used to determine whether to mark directory as user data or application data.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Directory</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into Directory table</td>
<td>AppVOVERRIDE</td>
<td>1</td>
<td>Override directory contents during upgrade</td>
</tr>
</tbody>
</table>

**ISVirtualFile Table**

The following are App-V settings in the ISVirtualFile table.

**Table 12-23 • App-V Settings ISVirtualFile Table**

<table>
<thead>
<tr>
<th>File</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into File table</td>
<td>AppVUserData</td>
<td>1</td>
<td>If set, then treat this file as user data. If unspecified, then default algorithm is used to determine whether to mark file as user data or application data.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>File</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into File table</td>
<td>AppVOVERRIDE</td>
<td>1</td>
<td>Override file during upgrade</td>
</tr>
</tbody>
</table>

**ISVirtualRegistry Table**

The following are App-V settings in the ISVirtualRegistry table.

**Table 12-24 • App-V Settings in ISVirtualRegistry Table**

<table>
<thead>
<tr>
<th>Registry</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into Registry table</td>
<td>AppVOVERRIDE</td>
<td>1</td>
<td>If set, virtual application will only see the registry key contents in the virtual package and no child keys that may be present on the physical machine. Otherwise, virtual application will see only values in the virtual package, but will see child keys present on the physical machine, if they are not also present in the virtual package.</td>
</tr>
</tbody>
</table>
**ISVirtualShortcut Table**

The following are App-V settings in the ISVirtualShortcut table.

**Table 12-25 • App-V Settings in ISVirtualShortcut Table**

<table>
<thead>
<tr>
<th>Shortcut</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key into Shortcut table</td>
<td>AppVApplication</td>
<td>0</td>
<td>A value of zero indicates that this shortcut will not be included in the converted App-V package.</td>
</tr>
</tbody>
</table>

**Manually Adding an Entry to the ISVirtualShortcut Table**

Typically the target version in an OSD file is automatically determined during conversion to App-V 4.x package format. The version of the shortcut target file is used, or if the target file does not have a version, then a default value of ‘1.0’ is used. To set a custom version, you can manually add an entry to the ISVirtualShortcut table.

**Task**

*To manually populate the ISVirtualShortcut table using the InstallShield Editor:*

1. Open the **Direct Editor** view.
2. Select the **ISVirtualShortcut** table and click **New** to add a new record.
3. Enter the following values:
   - For **Shortcut**, enter the key of the shortcut.
   - For **Name**, enter the property name which is **AppVTargetVersion**.
   - For **Value**, enter the desired version number.
4. Click **OK**.

*Note* • This setting only has effect for App-V 4.x conversion.

**Miscellaneous Virtual Conversion Settings**

You can edit the following XML file to modify global settings that also govern the creation of virtual packages.

**Table 12-26 • Miscellaneous Settings**

<table>
<thead>
<tr>
<th>Location</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>System\Msi.xml</td>
<td>IgnoreTables</td>
<td>MSI table names</td>
<td>Control whether an error or warning is flagged for certain tables during conversion</td>
</tr>
</tbody>
</table>
Chapter 12  Creating Customized Virtual Applications

Creating Citrix Profiles

You can use the Citrix Assistant to help you author a Citrix profile for an application. The Citrix profile can then be deployed on a Citrix XenApp. These deployed applications run within isolation environments that prevent them from interfering with other software running on the same machine. Using the Citrix Assistant, you can configure a Citrix profile’s operating system and language requirements, files, folders, shortcuts, registry settings, script execution, isolation options, and build options.

Information about creating Citrix profiles using the InstallShield Citrix Assistant is organized into the following sections:

### Table 12-26 • Miscellaneous Settings

<table>
<thead>
<tr>
<th>Location</th>
<th>Name</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>System\Msi.xml</td>
<td>IgnoreCustomActions</td>

<tr>
<td>System\Msi.xml</td>
<td>PropertyDefaults</td>
<td>MSI property names with given values</td>
<td>Default values to use for certain MSI properties rather than flagging them as warnings</td>
</tr>
<tr>
<td>Support\0409\settings.xml</td>
<td>GlobalBuildRedirectFolder</td>
<td>Absolute directory path</td>
<td>Instead of creating the converted virtual applications in a folder next to the source MSI, put them in a new folder under this specified location</td>
</tr>
</tbody>
</table>

### Editing the Settings.xml File

To edit the Settings.xml file, add a property element for each setting in the Virtualization/Properties section of the file. You can find the Settings.xml file in the following directory:

[InstallShield Installation Directory]\Support\0409

Edit the following section of the file:

```
<Virtualization>
...
<Properties>
   <!--Use this section to provide a global default for any setting that is found in the ISVirtualPackage table-->
   <!--<Property Name="AppVRuntimeDrive" Value="G:"/>-->
   <!--<Property Name="AppVServerURLPath" Value="%PackageName%_v%PackageVersion%" />-->
</Properties>
</Virtualization>
```
Overview of the Citrix Assistant

You can use the Citrix Assistant to help you author a Citrix profile for an application. The Citrix profile can then be deployed on a Citrix XenApp. These deployed applications run within isolation environments that prevent them from interfering with other software running on the same machine. Using the Citrix Assistant, you can configure an application’s operating system and language requirements, files, folders, shortcuts, registry settings, script execution, isolation options, and build options.

The process for authoring a Citrix profile using the Citrix Assistant is as follows:

**Table 12-27 • Steps to Convert a Windows Installer Package to a Citrix Profile**

Table 12-27 • Steps to Convert a Windows Installer Package to a Citrix Profile
About Citrix XenApp

Citrix XenApp is an application delivery system for Windows applications that offers both application virtualization and application streaming. Applications are centralized on the Citrix XenApp, and then those applications are deployed to users throughout the enterprise. These deployed applications run within isolation environments that prevent them from interfering with other software running on the same machine.

**Citrix XenApp: 2 Steps to Application Delivery**

![Diagram](image)

**Figure 12-7: Citrix XenApp: Two Steps to Application Delivery**

When applications are deployed on a Citrix XenApp, users can run those applications in an isolation environment, without installing, while connected or offline. Applications behave just like they were installed locally, but without any of the problems of installation, such as interfering with other applications on the same device. Files are saved locally and individual settings are preserved. Every time the application is run, it checks for errors or updates and they are delivered automatically.

**Note** • For more information, see *Benefits of Deploying Citrix Profiles.*

About the Citrix Assistant

You can use the Citrix Assistant to prepare a Windows Installer package for deployment on Citrix XenApp by converting it to a Citrix profile. During this process, you:

- **Profile Information**—Specify profile information.
- **OS and Language Requirements**—Specify the operating system and language requirements for the application.
Creating Customized Virtual Applications

Creating Citrix Profiles

- **Files, Folders, Shortcuts, Registry Settings**—Specify files, folders, shortcuts, and registry settings included in application.
- **Isolation Options**—Define a set of options for running the application in isolation on the user desktop.
- **Build**—Specify build settings and build a Citrix profile.

The following diagram illustrates the Citrix profile creation process:

![Citrix Assistant: Preparing Packages for Deployment to Citrix XenApp](image)

**Figure 12-8:** Preparing Packages for Deployment on Citrix XenApp

**See Also**

- Components of an App-V Package
- Using the Microsoft App-V Assistant to Create an App-V Package

About Citrix Profiles

When you use the Citrix Assistant to prepare a Windows Installer package for deployment on the Citrix XenApp, the resources you generate are called *profiles*. A profile consists of the following files and directories:

**Table 12-28 • Components of an Citrix Profile**

<table>
<thead>
<tr>
<th>Component</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile Manifest</td>
<td>myapp.profile</td>
<td>An XML file that defines the profile.</td>
</tr>
<tr>
<td>File</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Chapter 12  Creating Customized Virtual Applications

Creating Citrix Profiles

Caution • Modifying these files directly is not recommended. To make any modifications, use the Citrix Assistant.

These files are saved in a directory named CitrixProfile. The location of the CitrixProfile directory depends upon the type of file you are editing in InstallShield:

- **InstallShield project**—The CitrixProfile directory will be located in a subdirectory of the directory that contains this InstallShield project file, such as:
  
  C:\InstallShield 2008 Projects\ProductName\ConfigurationName\ReleaseName\CitrixProfile

- **Windows Installer package**—The CitrixProfile directory will be located in the same directory as the Windows Installer file, such as:
  
  C:\FolderContainingMSI\CitrixProfile\ProductName

The contents of the application profile are published on the Citrix XenApp.

A profile can contain a single application or suite of applications. For example, you can profile Microsoft Word by itself, or you can profile the entire Microsoft Office suite in a single profile.

**See Also**

*Using the Microsoft App-V Assistant to Create an App-V Package*

**Benefits of Deploying Citrix Profiles**

AdminStudio 2019 | Citrix Assistant

Converting a Windows Installer package to a Citrix profile and deploying it on a Citrix XenApp offers the following benefits:

- **Reduces Application Conflicts**
- **Enables Rapid, Low-Cost Application Deployment**
- **Enables Automatic Software Updates**
- **Centralized Application Management Provides Controlled Access and Security**
- **Enables User-Based Application Access Rather Than Machine-Based Access**
Chapter 12  Creating Customized Virtual Applications
Creating Citrix Profiles

Reduces Application Conflicts
Traditionally to deploy an application throughout an enterprise, the application was installed on each user’s desktop. Therefore, prior to installation, each application had to be tested for conflicts against each target desktop image (operating system with existing applications). After resolving conflicts that were found during testing, each application then had to be installed on each desktop. This process was very time consuming not only during initial installation, but also when applying patches or upgrading.

Citrix profiles run within isolation environments, which separate the interaction between an application and the underlying operating system’s resources in order to prevent the applications from interfering with others running on the same machine. Because applications do not interact, the need to perform any conflict analysis and regression testing prior to deployment is eliminated. This not only results in rapid application deployment, but it also reduces the total cost of application delivery, due to decreased labor by IT.

Also, because users running applications in an isolation environment encounter no conflicts with other applications, user calls to the help desk are decreased.

Enables Rapid, Low-Cost Application Deployment
Deploying Citrix profiles on Citrix XenApp simplifies the deployment of new applications, updates, and patch deployment, regardless of the diversity of the access devices, software languages, computing architectures, and networks that are involved.

- **Only a single instance of the application is installed**—Instead of deploying, managing, updating, and securing a vast array of heterogeneous client software on each individual user’s access device, a single instance of the application is installed on the Citrix XenApp. The IT department needs to test for only one environment, and deploy and update in one place. This reduces the cost of application installation and support. Also, you can deploy a Citrix profile once on a Citrix XenApp and replicate it to other Citrix XenApps within the existing enterprise infrastructure.

- **Prevents application-specific server silos**—Deploying applications on Citrix XenApp prevents the build-up of application-specific server silos because you can safely install and reliably run multiple application versions and incompatible applications on the same server.

- **Enables you to quickly install and update software throughout your enterprise**—Because your IT staff can manage the delivery of all of your Windows-based applications from one centralized location, your IT staff does not need to go from desktop to desktop, traveling to each office, in order to install or update software. With Citrix XenApp, you can deliver applications and updates instantly anywhere, any time.

Enables Automatic Software Updates
When an upgrade or patch needs to be deployed, you would only need to update the Citrix profile on the Citrix XenApp, which will then automatically update all of the instances of that Citrix profile throughout the enterprise. This means that users always have the latest application updates and patches, automatically.

Centralized Application Management Provides Controlled Access and Security
With Citrix XenApp, you can centralize applications and data in secure data centers, which increases data security and ensures fast, reliable performance. Centralized application management using Citrix XenApp provides the following benefits:

- **Enhances security**—Enables you to control, protect, and retain intellectual property centrally to reduce the chance for data loss and theft. Citrix XenApp helps you prevent data from leaving the data center without your explicit permission, which supports regulatory compliance and security objectives. You can provide authorized access to
appropriate users—such as employees, customers, and partners—while verifying the ongoing security of the environment.

- **Can provide managed access to applications to users outside of your organization**—You can standardize the use of applications, without having to standardize the machines that the applications use. This enables you to provide managed access to applications from computers that are not your own corporate assets, such as from contractor or consultant computers.

- **Monitors application usage and performance**—Citrix XenApp gives you end-to-end visibility into application usage and performance. It gives IT administrators the power to understand who is using what, how often, and to what extent. They can observe, monitor, measure, audit, report and archive all the dimensions of information flow throughout the computing environment. This enables informed decisions regarding application consolidation and retirement, capacity planning, service level agreements and departmental charge-back.

- **Enables identity-driven access**—Citrix XenApp enables you to provide identity-driven access tailored to any user environment. It automatically analyzes the user’s permissions and then delivers the appropriate level of access to applications without compromising security. Depending on who and where users are and what device and network they’re using, they may be granted different levels of access. You can also easily “decommission” applications by simply turning off a user’s permission to it.

### Enables User-Based Application Access Rather Than Machine-Based Access

Users can access their applications anywhere on the network, regardless of where they are or what device they are using.

### Supported InstallShield Project Types

AdminStudio 2019 | Citrix Assistant

The **Citrix XenApp** tab is available when one of the following InstallShield project types is open:

- Basic MSI Project
- MSI Database (Direct Edit Mode)
- Transform (Direct MST Mode)

**See Also**
Using the Microsoft App-V Assistant to Create an App-V Package

### How Transforms are Included in a Citrix Profile

AdminStudio 2019 | Citrix Assistant

The Citrix Assistant supports the inclusion of transform files with Windows Installer packages in a Citrix profile.

- **How transforms are applied during profile generation**—When building a Citrix profile, transforms that you have specified are automatically applied to the base Windows Installer (.msi) package to create a temporary package, and then the Citrix profile is generated from that temporary package.
Creating a new transform—You can create a new transform in InstallShield, and then build a profile from that transform file. When you create a new transform file in InstallShield, you specify the root .msi file in the Open Transform wizard. The steps you take to generate a profile after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

Converting a Windows Installer package with existing transforms—If you have a Windows Installer package and one or more existing transform files, and you want to include these transforms in the Citrix profile, you need to open one of the transforms in InstallShield (rather than the .msi file). The Open Transform wizard will open, and you will be prompted to specify the root .msi file and which of the existing .mst files you want to include. The steps you take to generate a profile after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

Caution • All of the transforms that you add to a Citrix profile must be located in the same folder as the Windows Installer .msi package so that they can be accessed when the profile is built.

Specifying Citrix Profile Information

When creating a Citrix profile, you need to specify the Name, Description, and Version of the Citrix profile. You also need to specify whether this package can run executables that are not included with the Citrix profile, and whether to include diagnostic tools with the Citrix profile. The following tasks are performed on the Profile Information page of the Citrix Assistant:

- Specifying the Profile Name, Description, and Version
- Specifying Whether Users Should Be Able to Update Applications
- Including Diagnostic Tools in an App-V Package

See Also
Profile Information Page

Specifying the Profile Name, Description, and Version

On the Profile Information page of the Citrix Assistant, you name the Citrix profile, and provide a description and version number.

Task
To specify the Citrix profile name, description, and version:

1. In the Citrix Assistant, open the Profile Information page.
2. In the Name field, enter a name for this Citrix profile. The name you enter here determines the file name of the generated Citrix profile.

Tip • Do not include the version number in the profile name.

3. In the Description field, enter a brief explanation of the purpose of this package. This information is stored as package metadata.
4. In the Version field, enter the version number of this Citrix profile. This information is stored as package metadata.
5. On the File menu, click Save to save your changes.

See Also
Overview of the Citrix Assistant
Profile Information Page

Specifying Whether Users Should Be Able to Update Applications

The Profile Information page is where you specify whether users can update applications.
Task

To specify whether users should be able to update applications:

1. In the Citrix Assistant, open the Profile Information page.

2. Select or clear the Enable User Updates (Allow profiled application to update itself—Not recommended) check box:
   - To allow the profiled application to download and install vendor-supplied updates over the Internet, select this check box. The updates are stored within the user profile root location for the specific user.
   - To ensure that all executable files from the profile are launched from the installation root location, and not from the user profile location, clear this check box. When this check box is cleared, the system prevents code from being run if it is not streamed from the server. Clearing this check box enables you to control updates through the profiler.

   This check box is cleared by default.

3. On the File menu, click Save to save your changes.

Profile Information Page

Including Diagnostic Tools With a Citrix Profile

On the Diagnostic Tools dialog box, which is opened by selecting Diagnostic Tools in the More Options list on the Profile Information page, you can choose to include the Registry Editor and the Windows Command Prompt diagnostic tools with your Citrix profile.

If you include diagnostic tools with your Citrix profile, you will be able to look at the registry or file system for the application while it is running in its isolation environment. For example, if you were running a Citrix profile and got an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

Caution • If you choose to include these diagnostic tools, the versions of regedit.exe and cmd.exe that are part of the operating system on the build machine are added to the Citrix profile. However, these tools may not be compatible with other operating systems.

Task

To include diagnostic tools with a Citrix profile:

1. In the Citrix Assistant, open the Profile Information page.

2. In the More Options list, click Diagnostic Tools. The Diagnostic Tools dialog box opens.
3. If you want to include the Registry Editor (regedit.exe) with your Citrix profile so that you can browse the profile registry at runtime from within the isolation environment, select the **Registry Diagnostics** option.

4. If you want to include the Windows Command Prompt application with your Citrix profile so that you can browse the virtual file system at runtime from within the isolation environment, select the **File System Diagnostics** option.

### Launching the Diagnostic Tools Within the Isolation Environment

If you selected the **Registry Diagnostics** or **File System Diagnostics** options on the **Diagnostic Tools** dialog box, shortcuts to those tools are automatically added to the profile.

When the user runs this Citrix profile application, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:

- `[ProductName] Registry`
- `[ProductName] File System`

When the user launches one of these shortcuts, that diagnostic tool is launched inside the context of the application’s Citrix isolation environment.

**See Also**
- Profile Information Page
- Diagnostic Tools Dialog Box

### Specifying Operating System and Language Requirements

The next step in creating a Citrix profile is to open the **Profile Requirements** page and specify the operating system and language requirements that client workstations need in order to run the application locally.

Some applications can run on multiple operating systems and languages, while others, such as custom applications, might be able to run only on a particular operating system or language. When creating a profile, you need to customize it for the supported operating systems and languages.

Information about specifying operating system and language requirements includes the following topics:

- **Setting Operating System Requirements and Service Pack Levels**
- **Setting Language Requirements**
- **How Requirements are Applied at Runtime**
Setting Operating System Requirements and Service Pack Levels

To specify the operating system and service pack level requirements for your application, perform the following steps.

Task

To specify operating system requirement and service pack levels:

1. In the Citrix Assistant, open the Profile Requirements page.

2. For the Does your Citrix profile have any specific operating system requirements? option, select one of the following:
   - **No**—Select this option if this application will run on all of the listed operating systems (which are the operating systems that the Citrix client supports). When this option is selected, the operating system check boxes are locked and cannot be changed.
   - **Yes**—Select this option if the application does not support one of the listed operating systems. When you select this option, the check boxes are unlocked and you can clear the selection of the unsupported operating systems.

3. If you set the previous option to Yes, do the following:
   a. Select the operating systems that this application supports, and clear those that this application does not support.
   b. For each of the selected operating systems, double-click on it and select Service Packs Requirement from the context menu to open the Service Packs Requirements dialog box, and choose one of the following options:
      - **No Service Pack Requirement**—This application supports all versions of this operating system, regardless of the number of Service Packs installed.
      - **No Service Pack Allowed**—This application only supports the initial release of this operating system; if any Service Packs are installed, this application will not run properly.
      - **Exact Service Pack Level**—This application requires the installation of a specific Service Pack on this operating system in order to run properly. Enter the required Service Pack Level in the box.
      - **At Least Service Pack Level**—To run properly, this application requires that this operating system have at least the specified Service Pack (or higher) installed. Enter the minimum required Service Pack Level in the box.
      - **At Most Service Pack Level**—To run properly, this application requires that this operating system have at most the specified Service Pack (or lower) installed. Enter the maximum required Service Pack Level in the box.
      - **Range of Service Pack Levels**—To run properly, this application requires that this operating system have a specified range of Service Packs installed. If you select this option, specify the Minimum Level and Maximum Level in the boxes.
Setting Language Requirements

To specify language requirements for your application, perform the following steps.

Task

To specify operating system requirement and service pack levels:

1. In the Citrix Assistant, open the Profile Requirements page.

2. For the Does your Citrix profile have any specific language requirements? option, select one of the following:
   - **No**—Select this option if this application will run on all of the listed languages (which are the languages that the Citrix client supports). When this option is selected, the language check boxes are locked and cannot be changed.
   - **Yes**—Select this option if the application does not support one of the listed languages. When you select this option, the check boxes are unlocked and only English is selected by default.

3. If you selected Yes in the previous step, select only those languages that this application supports.

See Also
Profile Requirements Page

How Requirements are Applied at Runtime

The requirements you specify on the Profile Requirements page determine how, or if, a user has access to the application.

When a user attempts to run an application, the Citrix XenApp checks to see whether that user’s workstation meets the profile’s specified requirements. Then, depending upon the Application Type assigned to that profile when it was published on the server, the user is:

- granted access to run the application locally, or
- granted access to run the application from the server, or
- denied access to the application.

The user access scenarios are presented in the following table:

<table>
<thead>
<tr>
<th>Application Type</th>
<th>User Access to Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessed from a server</td>
<td>User runs the application on the Citrix XenApp, using shared server resources.</td>
</tr>
</tbody>
</table>
Creating Customized Virtual Applications

Chapter 12  

Creating Citrix Profiles

1430
ADS-2019-UG00  AdminStudio 2019 User Guide

Caution • If an application has specific operating system or language requirements and you fail to specify them correctly when creating the profile, users who do not meet those requirements will be given access to run applications locally and they will probably encounter application errors.

Profile Requirements Page  
Setting Operating System Requirements and Service Pack Levels  
Setting Language Requirements

Adding Pre-Launch and Post-Exit Scripts

You can choose to include scripts with your profile that must execute either before profile launch or after profile exit in order for your application to run properly. On the Script Execution dialog box, which is opened by clicking Script Execution in the More Options list on the Profile Requirements page, you can view and manage all of the Before Profile Launch and After Profile Exit script files you are including with your Citrix profile.

• Files can be marked to run inside or outside of the isolation environment.
• Only files with .exe, .cmd, .com, or .bat extensions are allowed to execute.

To add a script to your Citrix profile, perform the following steps.

Task  
To add a before launch or after exit script to your Citrix profile:

1. Open the Profile Requirements page of the Citrix Assistant.
2. In the More Options list, click Script Execution. The Script Execution dialog box opens.
3. Select the **Before Profile Launch** or **After Profile Exit** node in the tree.

4. Click **Add...** The **Select Files to Add** dialog box opens.

5. Select the script file(s) (.exe, .bat, .cmd, or .com) that you want to add, and click **Open**. The file is added to the Script Execution tree on under the appropriate node.

   **Tip** • Use the **Shift** key to select multiple contiguous files, and use the **Ctrl** key to select multiple non-contiguous files.

6. Select a script in the tree. Several new fields and options are enabled.
Chapter 12  Creating Customized Virtual Applications

Creating Citrix Profiles

1432

You can now perform any of the following tasks:

- **Rename the file’s display name**—To rename the script file’s display name, click the **Rename** button and enter a new name. The name that is displayed on this dialog box to identify the script is changed, but the original name of the script file is not changed.

- **Select a different script**—To select a different script, click the **Browse** button and select a different script file (.exe, .bat, .cmd, or .com).

- **Reorder scripts**—If multiple scripts are listed under a node, you can use the **Move Up** and **Move Down** buttons to change the order that the scripts will be run. You can also reorder the scripts using the Ctrl+Shift+Up Arrow and Ctrl+Shift+Down Arrow keys.

- **Restrict script to isolation environment**—If you want this script to only be able to run within the Citrix profile’s isolation environment, select the **Restrict this file to the isolation environment** option.

- **Add command line parameters**—To add command line parameters to run along with the script, enter them in the **Command line parameters** box.

- **Delete a script**—To delete a script from the profile, select it and click the **Delete** button.

7. When you have set all desired options for the script, click **OK**.

## Managing Files and Folders in a Citrix Profile

The next step in creating a Citrix profile is to view existing files and folders, add and delete files and folders, and override the default isolation options for folders and files.

The following tasks are performed on the **Profile Files** page.
Managing Files and Folders in a Citrix Profile

The directories in the destination tree on the Profile Files page of the Citrix Assistant represent how your application will be organized within its isolation environment.

On the Profile Files page, you can view all of the files and folders that are currently in your Citrix profile, add new files and folders to include in the Citrix profile, and delete files and folders from the Citrix profile.

- Adding Files to a Citrix Profile
- Adding an Existing Folder (and its Contents) to a Citrix Profile
- Creating a New Folder
- Moving Files and Folders
- Deleting Files and Folders

Adding Files to a Citrix Profile

To add files to a Citrix profile, perform the following steps:
Creating Citrix Profiles

Task To add files to a Citrix profile:

1. In the Citrix Assistant, open the Profile Files page. The files and folders are listed in the Citrix Profile tree, organized by installation directory.

   ![](image)

   Folders are listed in the column on the left, and all of the files in the selected folder are listed on the right. Blue folders are the supported MSI standard folders. The folder with the check mark is INSTALLDIR, which represents the main product installation directory.

2. Browse through the folder tree to find the folder that you would like to add files to.

3. Select the folder and click the Add Files button. The Open dialog box opens.

4. Select the file or files that you want to add and click Open. The files you selected are now listed.

   Tip • To select multiple files, use the Shift key (for contiguous files) or the Ctrl key (for non-contiguous files).

Adding a File by Dragging and Dropping Files From Your System

You can also add files or folders to your Citrix profile on the Profile Files page by dragging them from a directory on your computer to the desired location in the tree.

Adding an Existing Folder (and its Contents) to a Citrix Profile

To add an existing folder and all of the files and subfolders within it to a Citrix profile, perform the following steps:
Task: To add an existing folder to a Citrix profile:

1. In the Citrix Assistant, open the Profile Files page. The files and folders are listed in the Citrix Profile tree, organized by installation directory.

2. Browse through the folder tree to find the folder that you would like to add a folder into.

3. Select the folder and click the Add Folders button. The Browse for Folder dialog box opens, listing all of the directories available to your computer.

4. Select a folder and click OK.

If you are editing an InstallShield project (not a Windows Installer package), you are prompted to choose whether you want to create a dynamic file link to the source folder.
5. Indicate whether you want to create a dynamic file link by selecting one of the following:

- **No**—For more flexibility with Citrix options, it is recommended that you select **No** to indicate that you do not want to use a dynamic file link, because you would then not be able to customize isolation options for any of the items in this folder.

- **Yes**—If you wish to use the default isolation options for all the files and folders under this folder, then select the dynamic file link option by clicking **Yes**. The **Dynamic File Link Settings** dialog box would then open, prompting you to specify the source folder for your dynamic link, and to set options regarding which files and folders to include in the dynamic link. See Dynamic File Link Settings Dialog Box.

The folder that you selected is now listed, along with of the files and folders within it.

**Creating a New Folder**

You can create a new, empty folder by selecting an existing folder in the tree and selecting **New Folder** from the context menu.

---

**Task**

**To create a new folder:**

1. Right-click on a folder in the **Citrix Profile** tree and select **New Folder**. A new folder is created as a subfolder of the selected folder.

2. Enter a name for the new folder.

**Moving Files and Folders**

To change the folder’s location in the Citrix Profile folder tree structure, perform the following steps:

---

**Task**

**To move a file or folder:**

1. Select the file or folder that you want to move.

2. With the mouse button down, drag the file or folder to the new location.

3. Release the mouse button.
Deleting Files and Folders

To delete a file or a folder (and all of its contents) from a Citrix profile, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To delete a file or folder:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Select the file or folder in the Citrix Profile tree that you want to delete.</td>
</tr>
<tr>
<td>2.</td>
<td>Select Delete from the context menu. You are prompted to confirm the deletion.</td>
</tr>
<tr>
<td>3.</td>
<td>Click Yes. The selected file or folder is deleted.</td>
</tr>
</tbody>
</table>

⚠️ **Caution** • If you choose to delete a folder, you are also deleting all of the files and subfolders that the folder contains from the entire Project, not just from the Citrix profile.

⚠️ **Note** • You cannot delete predefined folders. You can only turn off the display of those folders. For more information, see Controlling the Display of Predefined Folders.

Controlling the Display of Predefined Folders

On the Profile Files page, the Citrix Profile tree initially displays the more commonly used predefined folders, such as [ProgramFilesFolder] and [CommonFilesFolder].

These predefined folders are dynamic, meaning that they do not use hard-coded paths. The value for each destination folder is obtained from the operating system of the target machine.

You can control which predefined folders are listed in this tree.
Task

To change which predefined folders are listed:

1. In the Citrix Profile tree, select the Citrix Profile node (or any of the files or folders that are listed, point to Show Predefined Folder. A list of predefined folders opens.

Those folders that are already displayed are preceded by a check mark, and those that are not displayed do not have a check mark.

2. To add a folder to the tree listing, select a folder that is not currently listed in the tree.

Note • These predefined folders are always added to the root of the Citrix Profile tree, no matter what file or folder you had selected when you selected it from the Predefined Folders list.

3. To remove a folder from the tree listing, select that folder name in this list (which is preceded by a check mark).

Note • You cannot turn off the display of the [ProgramFilesFolder].

Setting Isolation Options

AdminStudio 2019 | Citrix Assistant

The Citrix XenApp uses isolation environments to control application compatibility and accessibility. The isolation option that is assigned to a file, folder or registry key specifies how the isolation environment will provide access to system resources requested by the application.

The default settings for isolation options are set on the Citrix XenApp, and those defaults are adequate for most environments. However, you can override the default settings for selected files, folders, or registry keys to exert control over application interactions with client operating system resources.
You set isolation options on the **Isolation Options** dialog box, which is open by selecting a file or folder and then selecting **Isolation Options** from the context menu.

Information about setting isolation options is presented in the following topics:

- **Overview of Citrix Isolation Options**
- **Setting Isolation Options for Folders and Files**
- **Inheritance of Isolation Options from Folders to Files**

⚠️ **Caution** • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects and registry settings.

### Overview of Citrix Isolation Options

The Citrix XenApp uses isolation environments to control application compatibility and accessibility. The isolation option that is assigned to a file, folder or registry key specifies how the isolation environment will provide access to system resources requested by the application.

The default settings for isolation environments are set on the Citrix XenApp, and those defaults are adequate for most environments. However, in the Citrix Assistant, you can override the default settings for selected files, folders, or registry keys to exert control over application interactions with client operating system resources.

You set isolation options on the **Isolation Options** dialog box, which is opened by selecting **Isolation Options** on the context menu when you have a file or folder selected on the **Profile Files** page or a registry key selected on the **Profile Registry** page.

On the **Isolation Options** dialog box, you can choose one of the following isolation options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>Select this option if you want the default isolation option for this file/folder/registry key as defined on the Citrix XenApp to be applied to this selection. This is the default selection for all files, folders, and registry keys.</td>
</tr>
</tbody>
</table>

⚠️ **Caution** • You should select this option unless you require specific custom handling.
### Table 12-31: Isolation Options (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Ignore         | Choose the **Ignore** option to direct the isolation environment to *always* use the copy of this selected file/folder/registry key that is on the system, not the one inside the isolation environment. Choosing this option gives the isolation environment direct access to the same location on the system that a non-isolated version of this application would have. By assigning the **Ignore** isolation option, you are creating a “hole” in the isolation environment to allow an application to write to the underlying system. For example, you would select **Ignore** in the following situations:  
  - If an application creates a directory for per-user data that is stored in a non-standard location.  
  - If the workstation has extra drive volumes and an installer writes to those drives while installing into a target.  
  - If your file share volume is on your packaging workstation.  
  - When the Citrix profile needs to share data with an application outside the isolation environment, such as when users print to a network printer. |
| Isolate        | Choose the **Isolate** option to direct the isolation environment to first try to find the copy of this file/folder/registry key that is inside the isolation environment. If the item is not found there, then the isolation environment will use the copy of this file/folder/registry key that is on the system. Selecting **Isolate** ensures that the isolation environment is not given direct write access to the specified system resource. |
| Strictly Isolate| Choose the **Strictly Isolate** option to direct the isolation environment to **always** use the copy of this file/folder/registry key that is in the isolation environment, not on the system. This is useful when running two versions of an application on the same machine. |
| Redirect       | Choose the **Redirect** option to redirect a request by the isolation environment for a file/folder/registry key to a specified location on the system (without first searching the user profile root and installation root locations). When selecting this option, you also need to select the location that the isolation environment should redirect to:  
  - **Source**—Lists the name of the selected item (filename, folder name, registry key).  
  - **Destination**—*[Files and folders only]* Click the Browse […] button and select the file or folder on the system that you want to redirect to.  
  - **Destination Root**—*[Registry keys only]* Select the registry root of the registry key on the system that you want to redirect to.  
  - **Destination Key**—*[Registry keys only]* Select the registry key on the system that you want to redirect to. |
Setting Isolation Options for Folders and Files

AdminStudio 2019 | Citrix Assistant

To override a file or folder’s default isolation options set on the Citrix XenApp, perform the following steps:

**Task**

To set an isolation option on a folder or file.

1. Open the Profile Files page.
2. Browse through the folder tree to find the file or folder that you would like to modify.
3. Select the file or folder and click Isolation Options on the context menu. The Isolation Options dialog box opens.
4. Select one of the following options, as described in Table 12-31, Isolation Options.
   - Default
   - Ignore
   - Isolate
   - Strictly Isolate
   - Redirect
5. Click OK. Files and folders that have an isolation setting other than default are marked with a special icon:

Inheritance of Isolation Options from Folders to Files

AdminStudio 2019 | Citrix Assistant

Isolation options for files, folders and registry keys are always inherited. The Citrix isolation environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for C:\Windows and one for C:\Windows\System32. When the application requests C:\Windows\System32\Notepad.exe, then the C:\Windows\System32 isolation rule will be applied because C:\Windows\System32 is a more specific reference to C:\Windows\System32\Notepad.exe than is C:\Windows.

Figure 12-9: Example of Inheritance of Isolation Options from Folders to Files

Modifying Profile Shortcut Settings

AdminStudio 2019 | Citrix Assistant

You define profile shortcuts to enable users to launch a Citrix profile from within the isolation environment.
By default, the Citrix Assistant creates shortcuts to all of the executable (.exe) files that were added to the profile on the Profile Files page. These shortcuts are listed in a checklist on the Profile Shortcuts page.

**Tip** • Citrix currently only supports 16 color icons for shortcuts. Therefore, if you specify an Icon File on the Shortcuts view of the Installation Designer, be sure to select an icon that includes only 16 colors.

When you select each shortcut, details about it are displayed:

![Figure 12-10: Initial List of Shortcuts for an Application](image)

**Caution** • You must define at least one shortcut to enable users to launch the application from the isolation environment.

On the Profile Shortcuts page, you can create, delete, include, exclude, or rename a profile's shortcuts.

- App-V Packages and the Virtual Environment
- App-V Shortcut Requirements
- Creating a New App-V Package
- Including an Existing App-V Shortcut
- Excluding or Deleting an Existing App-V Package
- Renaming a Shortcut

**Shortcuts and the Isolation Environment**

When a profile is published on the Citrix XenApp, the administrator has the option of placing available shortcuts on the client's desktop, client's Start menu, or only in the Citrix Program Neighborhood Agent applications list.

Shortcut presentation is specified in the Application shortcut placement area of the Shortcut presentation view of the Citrix Access Management Console Application Properties dialog box.
In the **Application shortcut placement** area, you have the following options:

### Table 12-32 • Shortcut Presentation Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Add to the client’s Start menu** | Select this option to create a shortcut to this application in the user’s local Start menu. A Client Application folder appears in the first pane of the Start menu:  
  Start  
  MyApplicationFolder  
  ApplicationName  
  When you select this option, the Place under Programs folder and Start menu folder fields are enabled. |
| **Place under Programs folder**  
  (Program Neighborhood Agent Only) | Select the **Place under Programs folder** option to create a shortcut to this application under the Programs folder of the user’s local Start menu.  
  • If you leave the Start menu folder field blank, the shortcut is created in root folder of the Programs menu.  
  Start  
  Programs  
  MyApplicationFolder  
  ApplicationName  
  • If you specify a folder structure in the Start menu folder field, the shortcut is created in that folder structure within the local Programs folder, with each folder name separated with a backslash. For example, if you entered the following in the Start menu folder field:  
  MyApplicationFolder/ApplicationTools  
  Then, the shortcut would be created in the following folder structure:  
  Start  
  Programs  
  MyApplicationFolder  
  ApplicationTools  
  ApplicationName |
| **Start menu folder**  
  (Program Neighborhood Agent Only) | Add shortcut to the client’s desktop                                                                                                                                 |
| **Add shortcut to the client’s desktop** | Select this option to create a shortcut to this application on the user’s local desktop. |
Shortcut Requirements

For each Citrix profile, you are required to define at least one shortcut. Profile shortcuts enable users to access the isolation environment and launch the application. If you build a Citrix profile that does not contain any shortcuts, users will not be able to launch the application.

Creating a New Profile Shortcut

On the Profile Shortcuts page, you can add a new shortcut to a file within the Citrix profile.

Task

To create a new shortcut:

1. Open the Profile Shortcuts page. All of the shortcuts are listed:
   - Those that are currently included in the profile are selected.
   - Those that are currently excluded from the profile are not selected.

2. Click New. The Browse for a Shortcut Target File dialog box opens and prompts you to select a file within this profile.
3. Select the file that you want to create a shortcut to.

4. Click **Open**. A new shortcut is listed, and it is named the same name as the selected file.

5. To include this shortcut in the Citrix profile, make sure that its check box is selected.

### Including an Existing Profile Shortcut

**AdminStudio 2019 | Citrix Assistant**

If you want to include a previously excluded shortcut in a Citrix profile, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To include an existing profile shortcut:</th>
</tr>
</thead>
</table>
| 1.   | Open the **Profile Shortcuts** page. All of the executable (.exe) files that were added on the **Profile Files** page are listed.  
      | • Those that are currently included are selected.  
      | • Those that are currently excluded are not selected.  
| 2.   | To include a previously excluded shortcut, select the shortcut and select the check box. |

### Excluding vs. Deleting a Profile Shortcut

**AdminStudio 2019 | Citrix Assistant**

By default, the **Citrix Assistant** creates shortcuts to all of the executable (.exe) files that were added on the **Profile Files** page, and lists them in a checklist on the **Profile Shortcuts** page.

![Figure 12-12: Initial List of Shortcuts for an Application](image)

To prevent the shortcut from being created in the Citrix profile, you can choose to either delete or exclude it.

- **Excluding a shortcut**—When you exclude a shortcut, it will not be created in the Citrix profile, but it will remain in the InstallShield project. See Excluding a Profile Shortcut.
Deleting a Shortcut—When you delete a shortcut, it is removed from both the Citrix profile and the InstallShield project. See Deleting a Shortcut.

If you have any unnecessary shortcuts in your project, you can simply exclude them from the Profile by unchecking them in the shortcuts list. If you like to permanently remove a shortcut, you can delete it from the shortcut list.

Excluding a Profile Shortcut

If you want to exclude one of these shortcuts from being created in the Citrix profile, perform the following steps:

Task To exclude a shortcut:

1. Open the Profile Shortcuts page. All of the executable (.exe) files that were added on the Profile Files page are listed.
   • Those that are currently included are selected.
   • Those that are currently excluded are not selected.
2. To exclude a shortcut, select the shortcut and clear the check box.

Note • When you exclude a shortcut, it will not be created in the Citrix profile, but it will remain in the InstallShield project.

Deleting a Shortcut

To delete a shortcut, perform the following steps.

Task To delete a shortcut:

1. Open the Profile Shortcuts page. All of the shortcuts are listed.
2. Select the shortcut and click Delete.

Note • If you delete a shortcut on the Profile Shortcuts page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

Conditions When a Shortcut Should be Excluded or Deleted

To prevent a shortcut from being created in the Citrix profile, you can choose to either delete or exclude it, depending upon whether you want it to remain in the InstallShield project.

• Excluding a shortcut—When you exclude a shortcut, it will not be created in the Citrix profile, but it will remain in the InstallShield project. This means that the shortcut would be included in the Windows Installer package that is built from this InstallShield project. See Excluding a Profile Shortcut.

• Deleting a Shortcut—When you delete a shortcut, it is removed from both the Citrix profile and the InstallShield project. This means that the shortcut would also be deleted from the Windows Installer package that is built from this InstallShield project. See Deleting a Shortcut.
Renaming a Shortcut

To rename a shortcut, perform the following steps:

1. Open the Profile Shortcuts page. All of the executable (.exe) files that were added on the Profile Files page are listed.
2. Select the shortcut that you want to rename and click Rename. A box appears around the shortcut name, and the shortcut name becomes an editable field.
3. Enter a new name for the shortcut.

Modifying Profile Registry Settings

Using the Citrix Assistant, you can add, delete, or modify the registry settings in your Citrix profile. You can also override the Citrix default isolation options for selected registry keys. Isolation options specify how the isolation environment will provide access to system resources requested by the application.

Information about modifying profile registry settings on the Profile Registry page includes the following topics:

- About the Windows Registry
- Adding or Deleting Registry Keys and Values
- Setting App-V Package Registry Isolation Options

About the Windows Registry

The Windows registry is a system-wide database that contains configuration information used by applications and the operating system. The registry stores all kinds of information, including the following:

- Application information such as company name, product name, and version number
- Path information that enables your application to run
- Uninstallation information that enables end users to uninstall the application easily without interfering with other applications on the system
- System-wide file associations for documents created by an application
- License information
- Default settings for application options such as window positions
Keys, Value Names, and Values

The registry consists of a set of keys arranged hierarchically under the My Computer explorer. Just under My Computer are several root keys. An installation can add keys and values to any root key of the registry. The root keys that are typically affected by installations are:

- HKEY_LOCAL_MACHINE
- HKEY_USERS
- HKEY_CURRENT_USER
- HKEY_CLASSES_ROOT

A key is a named location in the registry. A key can contain a subkey, a value name and value pair, and a default (unnamed) value. A value name and value pair is a two-part data structure under a key. The value name identifies a value for storage under a key, and the value is the actual data associated with a value name. When a value name is unspecified for a value, that value is the default value for that key. Each key can have only one default (unnamed) value.

Note that the terms key and subkey are relative. In the registry, a key that is below another key can be referred to as a subkey or as a key, depending on how you want to refer to it relative to another key in the registry hierarchy.

Adding or Deleting Registry Keys and Values

Editing the registry on the Profile Registry page is performed much like it is performed on the InstallShield Registry View. See Editing the Registry.

See Also
About the Windows Registry
Setting App-V Package Registry Isolation Options

Setting Registry Isolation Options

To override a registry key’s default isolation options set on the Citrix XenApp, perform the following steps:

Task
To set an isolation option on a registry key:

1. Open the Profile Files page.
2. Browse through the registry tree to find the key that you would like to modify.
3. Select the folder or key and click Isolation Options on the context menu. The Isolation Options dialog box opens.
4. Select one of the following options, as described in Table 12-31, Isolation Options.
   - Default

Important • While you cannot explicitly set an isolation option on a registry value, registry values are subject to the isolation options of their keys.
• Ignore
• Isolate
• Strictly Isolate
• Redirect

5. Click OK. Registry keys that have an isolation setting other than default are marked with a special icon:

Tip • To import an existing registry (.reg) file, click the Import a .reg file option on the More Options list to open the Registry Import Wizard.

Inheritance of Isolation Options in the Registry

Isolation options for registry keys are always inherited. The Citrix isolation environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for the Microsoft registry key and one for Microsoft\Windows registry key. When the application requests Microsoft\Windows\CurrentVersion, then the Microsoft\Windows isolation rule will be applied because Microsoft\Windows is a more specific reference to Microsoft\Windows\CurrentVersion than is Microsoft.

Figure 12-13: Example of Inheritance of Isolation Options from Folders to Files

Modifying Build Settings

On the Build Settings page, you choose which releases of this InstallShield project you want to build a Citrix profile for when the project is built, specify whether you want to digitally sign the Citrix profile, and specify whether you want to include additional Windows Installer packages in the Citrix profile.
Also, if you are editing a Windows Installer package in Direct Edit mode (or Direct MST mode), you need to select the **Build Citrix Profile** option on the **Build Settings** page before you will be able to build a Citrix profile for that Windows Installer package.

- Selecting the Releases for Which You Want to Build App-V Packages
- Digitally Signing a Citrix Profile
- Including Additional Windows Installer Packages in a Citrix Profile
- Enabling App-V Package Building When in Direct Edit Mode

**Important** • You must create at least one Release (on the Releases view of the Installation Designer) before you will be able to select a Release on the **Build Settings** page.

### Selecting Releases to Build

You select the releases that you want to build a Citrix profile for on the **Releases** tree of the **Build Settings** page.

**Important** • You cannot create or edit a release in the Citrix Assistant. If no releases exist, you can simply click the **Build** toolbar button to create a new release or open the **Releases** view of the InstallShield Installation Designer. You must create at least one release before you will be able to build a Citrix profile. For more information, see Creating and Building Releases.

If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the **Releases** tree on the **Build Settings** page is not displayed.

**Task**

**To select releases to build:**

1. Open the **Build Settings** page.
2. Select the releases in the **Releases** tree that you want to build a Citrix profile for.

**Important** • When you select a release on the **Build Settings** page, you are specifying that whenever you build that particular release, you want to also build a Citrix profile for that release. However, the releases that are selected on the **Build Settings** page have no bearing upon which release is built when you click the **Build** button on the toolbar. When you initiate a build by clicking the **Build** button, a build is initiated for the **active** release—the release that was most recently selected on the Installation Designer **Releases** view. The output of that build would depend upon what releases were selected on the **Build Settings** page:

- **Active release selected**—A Windows Installer package and a Citrix profile would be built.
- **Active release not selected**—Only a Windows Installer package would be built.

**Note** • To build more than one release at a time, perform a batch build. See Performing Batch Builds.
Digitally Signing a Citrix Profile

You can digitally sign your Citrix profile to assure end users that neither your installation nor the code within your application has been tampered with or altered since publication. When you digitally sign your application, end users are presented with a digital certificate when they run your installation.

To digitally sign a Citrix profile:

1. Open the Build Settings page.
2. Select the Digitally sign Citrix profile option. The Personal Information Exchange file (.pfx) field is enabled. A .pfx file is a standard file format for digital certificates.
3. Click Browse and select the .pfx file that you want to use to digitally sign this Citrix profile.

Including Additional Windows Installer Packages in a Citrix Profile

Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. In addition to being able to convert a single Windows Installer package to a virtual application, you can also use the Citrix Assistant to convert an application suite of multiple Windows Installer packages into one virtual application.

To include additional Windows Installer packages in a Citrix profile, set the Would you like to include additional MSI files in the virtual package? option on the Build Settings page to Yes, and then select the packages that you want to add.

To include additional Windows installer packages in a Citrix profile:

1. Open the Build Settings page.
2. Set the Would you like to include additional MSI files in the virtual package? option to Yes.
3. Click the New button and select the Windows Installer packages that you want to add. After each file is selected, it will be listed in the Windows Installer Files (.msi) list.
   - The order of the packages can be changed by selecting a package in the list and clicking the Move Up and Move Down buttons.
   - Use the Delete button to delete a package from the list.
Enabling Citrix Profile Building When in Direct Edit Mode

AdminStudio 2019 | Citrix Assistant

When you are editing a Windows Installer (.msi) package or a transform (.mst) file in the Citrix Assistant, you are in Direct Edit Mode or Direct MST Mode. Because you are directly editing a Windows Installer package, you save your changes by selecting Save on the File menu. It is not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled.

However, you do need to run the build process to build a Citrix profile for this Windows Installer package. To do this, perform the following steps:

---

<table>
<thead>
<tr>
<th>Task</th>
<th>To enable Citrix profile building when in Direct Edit Mode:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open a Windows Installer package or a transform file in InstallShield. It will be opened in Direct Edit Mode or Direct MST Mode, and the Build function (Build on the Build menu and the Build toolbar button) will be disabled.</td>
</tr>
<tr>
<td>2.</td>
<td>Open the Build Settings page of the Citrix Assistant.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the Build Citrix Profile option. After you select this option, the Build Citrix Profile selection on the Build menu becomes enabled, as does the Build toolbar button.</td>
</tr>
</tbody>
</table>

Building a Citrix Profile

AdminStudio 2019 | Citrix Assistant

The method for building a Citrix profile depends upon what file you have open—an InstallShield project or a Windows Installer package.

- Building an App-V Package from Within an InstallShield Project
- Building an App-V Package from Within a Windows Installer Package in InstallShield

Building a Citrix Profile for an InstallShield Project

To build a Citrix profile for an InstallShield project, perform the following steps:

---

<table>
<thead>
<tr>
<th>Task</th>
<th>To build a Citrix profile for an InstallShield project:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the InstallShield project in InstallShield.</td>
</tr>
<tr>
<td>2.</td>
<td>On the Releases view of the Installation Designer, make sure that at least one release has been created, and select the release that you want to build.</td>
</tr>
</tbody>
</table>

**Important** • You cannot create or edit a release in the Citrix Assistant. If no releases exist, or if you want to create a new release, open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build a Citrix profile. For more information, see Creating and Building Releases.

| 3.   | Open the Build Settings page of the Citrix Assistant. |
4. In the **Releases** tree, select the same release that is selected on the **Releases** view of the InstallShield Installation Designer. This is the release that you will build a Citrix profile for.

**Important** • When you select a release on the **Build Settings** page, you are specifying that whenever you build that particular release, you want to also build a Citrix profile for that release. However, the releases that are selected on the **Build Settings** page have no bearing upon which release is built when you click the **Build** button on the toolbar. When you initiate a build by clicking the **Build** button, a build is initiated for the **active** release—the release that was most recently selected on the Installation Designer **Releases** view. The output of that build would depend upon what was selected on the **Build Settings** page:

- **Active release selected**—A Windows Installer package and a Citrix profile would be built.
- **Active release not selected**—Only a Windows Installer package would be built.

To build more than one release at a time, perform a batch build. See Performing Batch Builds.

5. Click the **Build** toolbar button (or select **Build Release** on the **Build** menu) to start building the active release.

The output of the build will be a Windows Installer package and a Citrix profile. For a description of the files that comprise a Citrix profile, see **Components of an App-V Package**.

**Building a Citrix Profile for a Windows Installer Package**

To build a Citrix profile for a Windows Installer package, perform the following steps:

**Task**

To build a Citrix profile for a Windows Installer package:

1. Do one of the following to open a Windows Installer package:
   - On the **File** menu, select **Open** and select a Windows Installer package (.msi).
   - On the **File** menu, select **Open** and select a transform file (.mst). The **Open Transform Wizard** opens and you are prompted to identify the transform file’s associated Windows Installer package.
   - On the **File** menu, select **New** to open the **New Project** dialog box. Select **Transform** and click **OK**. The **Open Transform Wizard** opens and you are prompted to identify the transform file’s associated Windows Installer package.

2. Use the Installation Designer to make any desired edits to the Windows Installer package or Transform file, and use the Citrix Assistant to set Citrix profile options.

3. On the **Build Settings** page of the Citrix Assistant, select the **Build Citrix profile** option.

4. Save the edits to the Windows Installer package or transform file by selecting **Save** on the **File** menu.

5. Click the **Build** toolbar button (or select **Build Citrix Profile** on the **Build** menu) to start building the Citrix profile.

The output of the build will be a Windows Installer package and a Citrix profile. For a description of the files that comprise a Citrix profile, see **Components of an App-V Package**.

**Note** • For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see **Virtualization Conversion Errors and Warnings**.
Citrix Assistant Reference

AdminStudio 2019 | Citrix Assistant

Reference information about the Citrix Assistant is organized into the following sections:

- Microsoft App-V Assistant Pages
- Microsoft App-V Assistant Dialog Boxes
- Building App-V Packages Through the Command Line
- Troubleshooting the Builds of App-V Packages
- Application Features that Require Pre- or Post-Conversion Actions

Pages

AdminStudio 2019 | Citrix Assistant

Including Diagnostic Tools in an App-V Package

Profile Requirements Page

On the Profile Requirements page of the Citrix Assistant, you can select the operating systems that client workstations must be running in order for your application to operate properly. By default, all operating systems that are supported by the Citrix client are selected.
The **Profile Requirements** page has the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Does your Citrix profile have any specific operating system requirements?** | Select one of the following:  
  - **Yes**—Select this option if the application does not support one of the listed operating systems. When you select this option, the check boxes are unlocked and you can clear the selection of the unsupported operating systems.  
  - **No**—Select this option if this application will run on all of the listed operating systems (which are the operating systems that the Citrix client supports). When this option is selected, the operating system check boxes are locked and cannot be changed. |
### Operating System / Service Packs List

If you set the **Does your Citrix profile have any specific operating system requirements?** option to **Yes**, this list becomes enabled.

To specify operating system requirements, first select the operating systems that this application supports, and clear those that this application does not support.

Then, for each of the selected operating systems, right-click on it and select **Service Packs Requirement** from the context menu to open the **Service Packs Requirements** dialog box, and choose one of the following options:

- **Not Required**—This application supports all versions of this operating system, regardless of the number of Service Packs installed.
- **No Service Packs Allowed**—This application only supports the initial release of this operating system; if any Service Packs are installed, this application will not run properly.
- **Exact Service Pack Level**—This application requires the installation of a specific Service Pack on this operating system in order to run properly. Enter the required Service Pack Level in the box.
- **At least Service Pack Level**—To run properly, this application requires that this operating system have at least the specified Service Pack (or higher) installed. Enter the minimum required Service Pack Level in the box.
- **At most Service Pack Level**—To run properly, this application requires that this operating system have at most the specified Service Pack (or lower) installed. Enter the maximum required Service Pack Level in the box.
- **Range of Service Pack Levels**—To run properly, this application requires that this operating system have a specified range of Service Packs installed. If you select this option, specify the Minimum Level and Maximum Level in the boxes.

### Does your Citrix profile have any specific language requirements?

Select one of the following:

- **No**—Select this option if this application will run on all of the listed languages (which are the languages that the Citrix client supports). When this option is selected, the language check boxes are locked and cannot be changed.
- **Yes**—Select this option if the application does not support one of the listed languages. When you select this option, the check boxes are unlocked and only **English** is selected by default.

### Language List

If you set the **Does your Citrix profile have any specific language requirements?** option to **Yes**, this list becomes enabled.

Select only those languages that this application supports.
Creating Citrix Profiles

Profile Files Page

AdminStudio 2019 | Citrix Assistant

On the Profile Files page of the Citrix Assistant, you can perform the following tasks:

- View Files and Folders
- Add Files and Folders
- Delete Files and Folders
- Set Isolation Options
- Modifying the Display of Predefined Folders

View Files and Folders

On the Profile Files page, you can view all of the files and folders that are currently in your Citrix profile.

![Citrix Assistant Profile Files Page](image)

Figure 12-17: Citrix Assistant Profile Files Page
Folders are listed in the Citrix Profile tree on the left, and all of the files in the selected folder are listed on the right.

- The directories in the tree represent how your application will look when it is installed on to your customer’s machine.
- Blue folders are the supported MSI standard folders.
- The folder with the check mark is INSTALLDIR, which represents the main product installation directory.

**Add Files and Folders**

On the Profile Files page, you can use the Add Files and Add Folders buttons to add new files and folders to include in the Citrix profile. See Adding, Deleting, and Moving Files and Folders in an App-V Package.

If you are editing an InstallShield project (not a Windows Installer package), and you are adding a folder to this profile, you are prompted to choose whether you want to create a dynamic file link to the source folder.

![Figure 12-18: Dynamic File Link Option Dialog Box](image)

Indicate whether you want to create a dynamic file link by selecting one of the following:

- **No**—For more flexibility with Citrix options, it is recommended that you select No to indicate that you do not want to use a dynamic file link, because you would then not be able to customize isolation options for any of the items in this folder.
- **Yes**—If you wish to use the default isolation options for all the files and folders under this folder, then select the dynamic file link option by clicking Yes. The Dynamic File Link Settings dialog box would then open, prompting you to specify the source folder for your dynamic link, and to set options regarding which files and folders to include in the dynamic link. See Dynamic File Link Settings Dialog Box.

**Delete Files and Folders**

You can delete files and folders from the Citrix profile by selecting the file or folder you want to delete, and selecting Delete from the context menu. For more information, see Deleting Files and Folders.

**Caution** • If you choose to delete a folder, you are also deleting all of the files and subfolders that the folder contains.

**Note** • You cannot delete predefined folders. You can only turn off the display of those folders. For more information, see Controlling the Display of Predefined Folders.

**Tip** • To select multiple files, use the Shift key (for contiguous files) or the Ctrl key (for non-contiguous files).
Set Isolation Options

The Citrix XenApp uses isolation environments to control application compatibility and accessibility. The isolation option that is assigned to a file, folder or registry key specifies how the isolation environment will provide access to system resources requested by the application.

The default settings for isolation environments are set on the Citrix XenApp, and those defaults are adequate for most environments. However, in the Citrix Assistant, you can override the default settings for selected files, folders, or registry keys to exert control over application interactions with client operating system resources.

You set isolation options by selecting a file or folder and then selecting Isolation Options from the context menu. For an overview of the available isolation options, and for instructions on how to set them, see Setting Isolation Options.

Modifying the Display of Predefined Folders

You can specify which of the Windows Installer predefined folders are listed in the Citrix Profile tree. See Controlling the Display of Predefined Folders.

See Also
Adding, Deleting, and Moving Files and Folders in an App-V Package
Controlling the Display of Predefined Folders
Setting Isolation Options

Profile Shortcuts Page

You define profile shortcuts to enable users to launch a Citrix profile from within the isolation environment.

By default, the Citrix Assistant creates shortcuts to all of the executable (.exe) files that were added to the profile. These shortcuts are listed in a checklist on the Profile Shortcuts page.

Note • Only shortcuts to executables are included in the profile. The Citrix Administrator chooses which of these shortcuts will be available to their users. When publishing, the Citrix Administrator chooses where to place the shortcut for their users to see.

Tip • Citrix currently only supports 16 color icons for shortcuts. Therefore, if you specify an Icon File on the Shortcuts view of the Installation Designer, be sure to select an icon that includes only 16 colors.
Creating Citrix Profiles

Figure 12-19: Profile Shortcuts Page

Shortcut Requirements

For each Citrix profile, you are required to define at least one shortcut. Profile shortcuts enable users to access the isolation environment and launch the application. If you build a Citrix profile that does not contain any shortcuts, users will not be able to launch the application.

Difference Between Deleting and Excluding a Profile Shortcut

To prevent a shortcut from being created in the Citrix profile, you can choose to either delete or exclude it, depending upon whether you want it to remain in the InstallShield project.

- Excluding a shortcut—When you exclude a shortcut, it will not be created in the Citrix profile, but it will remain in the InstallShield project. This means that the shortcut would be included in the Windows Installer package that is built from this InstallShield project. See Excluding a Profile Shortcut.

- Deleting a Shortcut—When you delete a shortcut, it is removed from both the Citrix profile and the InstallShield project. This means that the shortcut would also be deleted from the Windows Installer package that is built from this InstallShield project. See Deleting a Shortcut.

Managing Shortcuts

On the Profile Shortcuts page, you can create, delete, include, exclude, or rename a profile’s shortcuts. For step-by-step instructions, see the following topics:
• Creating a New App-V Package
• Including an Existing App-V Shortcut
• Excluding or Deleting an Existing App-V Package
• Renaming a Shortcut

See Also
Overview of the Citrix Assistant

Profile Registry Page

AdminStudio 2019 | Citrix Assistant

On the Profile Registry page, you can view existing registry items, and add or delete registry items. You can also override the Citrix default isolation options for a registry key. Isolation options specify how the isolation environment will provide access to system resources requested by the application.

Figure 12-20: Citrix Assistant Profile Registry Page

Registry items that are listed on this page will be included in the Citrix profile, and those that you delete will not. By default, all new registry keys are isolated.
Tip • To import an existing registry (.reg) file, click the Import a .reg file option on the More Options list to open the Registry Import Wizard.

Note • You cannot set isolation options on root registry keys.

Editing the registry on the Profile Registry page is performed much like it is performed on the InstallShield Registry View. See Editing the Registry.

For information on how to override a registry key’s default isolation options, see Setting App-V Package Registry Isolation Options.

Important • While you cannot explicitly set an isolation option on a registry value, registry values are subject to the isolation options of their keys.

Modifying App-V Package Registry Settings

Build Settings Page

On the Build Settings page, you can perform the following tasks:

- Selecting Releases to Build
- Digitally Signing a Citrix Profile
- Including Additional Windows Installer Packages in a Citrix Profile
- Enabling Citrix Profile Building When in Direct Edit Mode
- Building a Citrix Profile
Creating Citrix Profiles

Figure 12-21: Citrix Assistant Build Settings Page

Selecting Releases to Build

You select the releases that you want to build a Citrix profile for on the Releases tree of the Build Settings page. By selecting a release, you are specifying that whenever that particular release is built, a Citrix profile will also be built.

Note • If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the Releases tree on the Build Settings page is not displayed.

About Building Releases

When you select a release on the Releases tree on the Build Settings page, you are specifying that whenever you build that particular release, you want to also build a Citrix profile for that release. However, the releases that are selected on the Build Settings page have no bearing upon which release is built when you click the Build button on the toolbar. When you initiate a build by clicking the Build button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer Releases view. The output of that build would depend upon what releases were selected on the Build Settings page:

• Active release selected—A Windows Installer package and a Citrix profile would be built.
• Active release not selected—Only a Windows Installer package would be built.
Note • To build more than one release at a time, perform a batch build. See Performing Batch Builds.

About Creating Releases

You create and edit releases on the Releases view of the InstallShield Installation Designer. You cannot create or edit a release in the Citrix Assistant.

If no releases exist, or if you want to create a new release, open the Releases view of the Installation Designer. You must create at least one release before you will be able to build a Citrix profile. For more information, see Creating and Building Releases.

Digitally Signing a Citrix Profile

You can digitally sign your Citrix profile to assure end users that neither your installation nor the code within your application has been tampered with or altered since publication. When you digitally sign your application, end users are presented with a digital certificate when they run your installation.

To digitally sign a Citrix profile, select the Digitally sign Citrix profile option on the Build Settings page. When this option is selected, the Personal Information Exchange file (.pfx) field is enabled. A .pfx file is a standard file format for digital certificates. You then click Browse and select the .pfx file that you want to use to digitally sign this Citrix profile.

Including Additional Windows Installer Packages in a Citrix Profile

Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. In addition to being able to convert a single Windows Installer package to a virtual package, you can also use the Citrix Assistant to convert an application suite of multiple Windows Installer packages into one virtual package.

To include additional Windows Installer packages in a Citrix profile, set the Would you like to include additional MSI files in the virtual package? option to Yes, and then select the packages that you want to add.

- Click the New button ( ) and select the Windows Installer packages that you want to add. After each file is selected, it will be listed in the Windows Installer Files (.msi) list.
- The order of the packages can be changed by selecting a package in the list and clicking the Move Up ( ) and Move Down ( ) buttons.
- Use the Delete button ( ) to delete a package from the list.

Enabling Citrix Profile Building When in Direct Edit Mode

When you are editing a Windows Installer (.msi) package or a transform (.mst) file in the Citrix Assistant, you are in Direct Edit Mode or Direct MST Mode. Because you are directly editing a Windows Installer package, you save your changes by selecting Save on the File menu. It not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled.

However, you do need to run the build process to build a Citrix profile for this Windows Installer package. To enable the Build button to build the Citrix profile, select the Build Citrix Profile option on the Build Settings page.

After you select this option, the Build Citrix Profile selection on the Build menu becomes enabled, as does the Build toolbar button.
Building a Citrix Profile

The method for building a Citrix profile depends upon what file you have open—an InstallShield project or a Windows Installer package. For detailed instructions, see one of the following topics:

- Building an App-V Package from Within an InstallShield Project
- Building an App-V Package from Within a Windows Installer Package in InstallShield

Dialog Boxes

The Citrix Assistant includes the following dialog boxes:

- Script Execution Dialog Box
- Diagnostic Tools Dialog Box
- File Isolation Options Dialog Box
- Folder Isolation Options Dialog Box
- Isolation Options Dialog Box (for Registry Keys)
- Service Packs Requirement Dialog Box

Script Execution Dialog Box

On the Script Execution dialog box, which is opened by clicking Script Execution in the More Options list on the Profile Requirements page, you can choose to include scripts that must execute for your application to run properly. From this dialog box, you can view and manage all of the Before Profile Launch and After Profile Exit script files you are including with your Citrix profile.

- Files can be marked to run inside or outside of the isolation environment.
- Only files with .exe, .com, .cmd, or .bat extensions are allowed to execute.
Diagnostic Tools Dialog Box

AdminStudio 2019 | Citrix Assistant

On the Diagnostic Tools dialog box, which is opened by selecting Diagnostic Tools in the More Options list on the Profile Information page, you can choose to include the Windows Command Prompt and Registry Editor diagnostic tools with your Citrix profile.

If you include diagnostic tools with your Citrix profile, you will be able to look at the registry or file system for the application while it is running in its isolation environment. For example, if you were running a Citrix profile and got an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

Caution • If you choose to include these diagnostic tools, the versions of regedit.exe and cmd.exe that are part of the operating system on the build machine are added to the Citrix profile. However, these tools may not be compatible with other operating systems.
Creating Citrix Profiles

Figure 12-23: Diagnostic Tools Dialog Box

You can use these diagnostic tools to inspect your application's isolation environment at runtime. You have the following options:

Table 12-36 • Diagnostic Tools Dialog Box Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Registry Diagnostics</td>
<td>Select this option if you want to include <code>regedit.exe</code> with your Citrix profile so that you can browse the profile registry.</td>
</tr>
<tr>
<td>File System Diagnostics</td>
<td>Select this option if you want to be able to browse the Citrix profile's isolation environment file system using a command prompt.</td>
</tr>
</tbody>
</table>

Launching the Diagnostic Tools Within the Isolation Environment

If you selected the **Registry Diagnostics** or **File System Diagnostics** options on the **Diagnostic Tools** dialog box, shortcuts to those tools are automatically added to the profile.

When the user runs this Citrix profile application, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:

```plaintext
[ProductName] Registry
[ProductName] File System
```

When the user launches one of these shortcuts, that diagnostic tool is launched inside the context of the application’s Citrix isolation environment.

<td>Select this option if this application requires the installation of a specific Service Pack on this operating system in order to run properly. Enter the required Service Pack Level in the box.</td>
</tr>
<tr>
<td>At Least Service Pack Level</td>
<td>Select this option if, to run properly, this application requires that this operating system have at least the specified Service Pack (or higher) installed. Enter the minimum required Service Pack Level in the box.</td>
</tr>
<tr>
<td>At Most Service Pack Level</td>
<td>Select this option if, to run properly, this application requires that this operating system have at most the specified Service Pack (or lower) installed. Enter the maximum required Service Pack Level in the box.</td>
</tr>
<tr>
<td>Range of Service Pack Levels</td>
<td>Select this option if, to run properly, this application requires that this operating system have a specified range of Service Packs installed. If you select this option, specify the Minimum Level and Maximum Level in the boxes.</td>
</tr>
</tbody>
</table>

**Building Citrix Profiles Using the Command Line**

When you configure a Citrix profile in an InstallShield project and then build that project (using either the user interface or the command line), both the Windows Installer package and the Citrix profile are built. When you use the standard InstallShield command line build, you do not need to add any additional command line parameters. All of the Citrix profile settings are saved within the InstallShield project.

**Citrix Profile Conversion Error and Warning Messages**

*Note* • For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see Virtualization Conversion Errors and Warnings.
Application Features Requiring Pre- or Post-Conversion Actions

Some application features are ignored when creating a Citrix profile. Therefore, some additional pre- or post-conversion actions must be taken in order for the application profile to run on Citrix XenApp.

One action you could take to try to include ignored features in a Citrix profile is to first repackage the application using the Repackaging Wizard, and then convert the repackaged application to a Citrix profile.

For a list of ignored features, see Application Features Requiring Pre- or Post-Conversion Actions.

Creating ThinApp Applications

Important • ThinApp support requires a separate purchase of VMware® ThinApp™.

ThinApp (formerly Thinstall Virtualization Suite) is a self-contained application virtualization solution that requires no client-side agents or supporting server infrastructure. A ThinApp application runs within a virtual environment that prevents it from interfering with other software running on the same machine.

You can use the InstallShield ThinApp Assistant to configure and build a ThinApp application. Information about creating ThinApp applications using the ThinApp Assistant is presented in the following sections:

- Overview of the Citrix Assistant
- Using the Microsoft App-V Assistant to Create an App-V Package
- Microsoft App-V Assistant Reference
- ThinApp Application Configuration File: package.ini

Overview of the ThinApp Assistant

A ThinApp application is a self-contained application virtualization solution that requires no client-side agents or supporting server infrastructure. A ThinApp application runs within a virtual environment that prevents it from interfering with other software running on the same machine. You can use the InstallShield ThinApp Assistant to configure and build a ThinApp application.

- About Microsoft Application Virtualization (App-V) and the Microsoft App-V Assistant
  - The ThinApp Virtual Operating System
  - Benefits of Deploying Citrix Profiles
- About the ThinApp Assistant
  - Process for Authoring an App-V Package Using the Microsoft App-V Assistant
  - Components of an App-V Package
  - Supported InstallShield Project Types
About ThinApp Applications

ThinApp applications can be deployed on a machine without modifying the local operating system or file system. They run in a “sandbox” (or virtual environment) which protects the local operating system from installation modifications that could affect stability or security. Also, ThinApp applications can be run safely from restricted user accounts without local installation.

Information about ThinApp applications is presented in the following sections:

- The ThinApp Virtual Operating System
- Benefits of Deploying Citrix Profiles

The ThinApp Virtual Operating System

A ThinApp application runs in a virtual operating system—a small light-weight component which is embedded with each ThinApp application—that consists of a virtual file system and a virtual registry. When the ThinApp application is run, the virtual operating system environment is merged with the real system environment.

The virtual operating system technology enables entire applications to be packaged into a single .exe file that can be run without an installation process, and without modifying the resident operating system.

A ThinApp application can be run from a network or offline on the local machine.

Benefits of Deploying ThinApp Applications

Deploying ThinApp applications provides the following benefits:

- **Reduces time to deployment and costs associated with testing**—Applications can be deployed and run in independent sandboxes, eliminating the need for expensive and time-consuming multi-application regression testing. This reduces the time to deployment and the costs associated with testing.

- **Fast, lightweight virtualization**—ThinApp does not use emulation, so all processes are executed natively at full speed.

- **Reduces the cost of maintaining secure locked-down desktops**—ThinApp applications can run in restricted user accounts without requiring any host modifications.

- **Enhances work-force mobility, business continuity and disaster recovery**—ThinApp applications can be run off-line, directly from any external media including USB Flash, CD-ROM, and off-line laptops.

- **No infrastructure changes needed**—ThinApp applications can be deployed using any existing software deployment systems including Active Directory and SMS. ThinApp has no client or server components to manage or maintain and ThinApp can transparently stream large applications from any network attached storage devices without server software.
• **Sandboxing prevents modifications**—ThinApp redirects all changes intended for the host computer’s file system and registry to a private per-user sandbox. Sandboxes can be located on a network share, allowing application settings to follow users as they move from machine to machine. For mobile users, sandboxes can be stored on local USB flash drives, thus preventing damage to the host computer or accidental host storage of sensitive data.

### About the ThinApp Assistant

**AdminStudio 2019 | ThinApp Assistant**

Information about the ThinApp Assistant is organized into the following sections:

- Process for Authoring an App-V Package Using the Microsoft App-V Assistant
- Components of an App-V Package
- Supported InstallShield Project Types
- How Transforms are Included in an App-V Package
- About Sandboxes

**See Also**

Components of an App-V Package
Using the Microsoft App-V Assistant to Create an App-V Package

### Process for Authoring a ThinApp Application Using the ThinApp Assistant

**AdminStudio 2019 | ThinApp Assistant**

You can use the ThinApp Assistant to convert a Windows Installer package into a ThinApp application. During this process, you:

- **General Settings**—Specify sandbox and Active Directory settings.
- **Files, Folders, Shortcuts, Registry Settings**—Specify the files, folders, shortcuts, and registry settings that will be included in the ThinApp application.
- **Isolation Options**—Override the default isolation options for selected folders and registry keys.
- **Build**—Specify build options and build a ThinApp application.

The following diagram illustrates the ThinApp application creation process:
Figure 12-28: Creating a ThinApp Application

The process for authoring a ThinApp application using the ThinApp Assistant is as follows:

Table 12-41 • Steps to Convert a Windows Installer Package to a ThinApp Application

Components of an App-V Package
Using the Microsoft App-V Assistant to Create an App-V Package
Components of a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

When you use the ThinApp Assistant to build a ThinApp virtual package, the resources you generate are called ThinApp applications. The number of files included in a ThinApp application depends upon how many shortcuts are defined in the project (or Windows Installer package) and whether you choose to include diagnostic tools with the ThinApp application.

Table 12-42 • Components of a ThinApp Application

<table>
<thead>
<tr>
<th>Number of Shortcuts</th>
<th>ThinApp Application Components</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 shortcut</td>
<td>ProductName.exe</td>
<td>The ThinApp application consists of a single executable (.exe) file:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Launching the application — This executable file is used to launch the ThinApp application.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Location of application data — This executable file contains all of the files, registry keys, DLLs, ThinApp components, and third party libraries that are required for the application to run.</td>
</tr>
<tr>
<td>More than 1 shortcut</td>
<td>ProductName.exe</td>
<td>The ThinApp application consists of two or more executable files and a Package.DAT file:</td>
</tr>
<tr>
<td></td>
<td>FeatureName.exe</td>
<td>• Launching the application — Each of the executables is used to launch the ThinApp application or a specific feature of the ThinApp application.</td>
</tr>
<tr>
<td></td>
<td>Package.DAT</td>
<td>• Location of application data — The Package.DAT file contains all of the files, registry keys, DLLs, ThinApp components, and third party libraries that are required for the application to run.</td>
</tr>
<tr>
<td>1 shortcut with</td>
<td>ProductName.exe</td>
<td>The ThinApp application consists of three executable files and a Package.DAT file:</td>
</tr>
<tr>
<td>diagnostic tools</td>
<td>cmd.exe</td>
<td>• Launching the application — The package executable is used to launch the ThinApp application.</td>
</tr>
<tr>
<td></td>
<td>regedit.exe</td>
<td>• Launching the diagnostic tools — The cmd.exe and regedit.exe executables are used to launch the Command Prompt and Registry Editor diagnostic tools.</td>
</tr>
<tr>
<td></td>
<td>Package.DAT</td>
<td>• Location of application data — The Package.DAT file contains all of the files, registry keys, DLLs, ThinApp components, and third party libraries that are required for the ThinApp application and the diagnostic tools to run.</td>
</tr>
</tbody>
</table>
ThinApp application files are saved in a directory named ThinAppPackage. The location of the ThinAppPackage directory depends upon the type of file you are editing in InstallShield:

- **InstallShield project**—The ThinAppPackage directory will be located in a subdirectory of the directory that contains this InstallShield project file, such as:
  
  ```
  C:\InstallShield 2009 Projects\ProductName\ConfigurationName\ReleaseName\ThinAppPackage
  ```

- **Windows Installer package**—The ThinAppPackage directory will be located in the same directory as the Windows Installer file, such as:
  
  ```
  C:\FolderContainingMSI\ThinAppPackage
  ```

**Caution** • Modifying these files directly is not recommended. To make any modifications, use the InstallShield ThinApp Assistant.

### Intermediate Data Files: Interm Directory

When a ThinApp application is built, files that support the ThinApp application build process are extracted out of the Windows Installer package and saved in a subdirectory of the ThinAppPackage directory named the *Interm* directory.

*Figure 12-29: Interm Subdirectory of the ThinAppPackage Directory*

The data in this directory is then compiled into ThinApp application as part of the build process. The data in the *Interm* directory does not need to be distributed with the ThinApp application.

**See Also**

- Using the Microsoft App-V Assistant to Create an App-V Package

### Supported InstallShield Project Types

The **VMware ThinApp** tab is available when one of the following InstallShield project types is open:

- Basic MSI Project
- MSI Database (Direct Edit Mode)
- Transform (Direct MST Mode)

**See Also**

- Using the Microsoft App-V Assistant to Create an App-V Package

### How Transforms are Included in a ThinApp Application

The ThinApp Assistant supports the inclusion of transform files with Windows Installer packages in a ThinApp application.
How transforms are applied when building a ThinApp application—When building a ThinApp application, transforms that you have specified are automatically applied to the base Windows Installer (.msi) package to create a temporary package, and then the ThinApp application is generated from that temporary package.

Creating a new transform—You can create a new transform in InstallShield, and then build a ThinApp application from that transform file. When you create a new transform file in InstallShield, you specify the root .msi file in the Open Transform wizard. The steps you take to generate a ThinApp application after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

Converting a Windows Installer package with existing transforms—If you have a Windows Installer package and one or more existing transform files, and you want to include these transforms in the ThinApp application, you need to open one of the transforms in InstallShield (rather than the .msi file). The Open Transform wizard will open, and you will be prompted to specify the root .msi file and which of the existing .mst files you want to include. The steps you take to generate a ThinApp application after using that wizard are exactly the same as if you were editing a Windows Installer package in Direct Edit mode.

Caution • All of the transforms that you add to a ThinApp application must be located in the same folder as the Windows Installer .msi package so that they can be accessed when the ThinApp application is built.

About Sandboxes

A ThinApp application runs in a sandbox, a virtual operating system—consisting of a virtual file system and a virtual registry—which is embedded with each ThinApp application. Running an application in a sandbox protects the local operating system from installation modifications that could affect stability or security. In a sandbox, system resources (such as files and registry keys) are redirected from the physical operating system files to the sandbox.

Many applications fail to run if the user does not have administrative rights because they expect to be able to write to global locations like HKEY_LOCAL_MACHINE and C:\Program Files. Using sandbox technology makes applications believe they have the ability to make global changes when they are actually writing to user and application-specific locations, and allows applications that require administrative rights to run without additional privileges. This feature allows ThinApp applications to run in security-restricted environments such as Windows Vista and Terminal Server.

What is a Sandbox Cache?

When you run a ThinApp application, additional files or registry keys may be produced. Depending upon the isolation options, some of this run time data will need to be stored locally in a sandbox cache, a local per-user directory.

When the ThinApp application is built, the local Sandbox cache is created in the following location, using the Sandbox Name that was entered on the General Settings page.

c:\Documents & Settings\USER_NAME\Application Data\ThinApp\SANDBOX_NAME

If the user’s Application Data directory is stored on a network share, the ThinApp application’s settings will automatically migrate when the same user logs in on another machine. You can also choose to create the sandbox cache in an external storage device such as a USB flash drive.
Using the ThinApp Assistant to Create a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

The steps you need to take to create a ThinApp application are the following:

<table>

Specifying ThinApp General Settings

AdminStudio 2019 | ThinApp Assistant

When creating a ThinApp application, you can, optionally, specify sandbox and Active Directory settings. You can also specify whether to include diagnostic tools with the ThinApp application. The following tasks are performed on the General Settings page of the ThinApp Assistant:

- Specifying Sandbox Information
- Specifying Control Access via Active Directory
- Prerequisites for Building a ThinApp Application
- Including Diagnostic Tools in an App-V Package

See Also
Profile Information Page

Specifying Sandbox Information

AdminStudio 2019 | ThinApp Assistant

In this step, you have the option of entering a name for the Sandbox cache that is created when the ThinApp application is built.

Note • For information on sandboxes and sandbox caches, see About Sandboxes.
Chapter 12  Creating Customized Virtual Applications
Creating ThinApp Applications

Task  To specify sandbox information:

1. In the ThinApp Assistant, open the General Settings page.

2. When a ThinApp application is built, a Sandbox cache is created in the following location:
   
c:\Documents & Settings\USER_NAME\Application Data\ThinApp\SANDBOX_NAME

   By default, AdminStudio names the Sandbox by assigning it a unique GUID. However, if you want to override this default Sandbox name, you may (optionally) enter a new name in the Sandbox Name field.

   Note • The Sandbox Name you enter here is also recorded in the Package . ini file.

3. If you want changes for Network mapped drives to be saved in the sandbox, then select the Mapped Network Drive Changes go to Sandbox option.

4. If you want changes for removable disks to be saved in the sandbox, then select the Removable Disk Changes go to Sandbox option.

5. If you want to delete the sandbox content when the ThinApp application exits, then select the Reset Sandbox on Exit option.

Specifying Control Access via Active Directory

AdminStudio 2019 | ThinApp Assistant

You can control the access of users to a ThinApp application by specifying Active Directory groups on the General Settings page. At build-time, ThinApp assigns a unique GUID-like number to uniquely identify each Active Directory Group that you identify. Members of those groups will have access to the ThinApp application. For more detailed information about how Active Directory permissions are assigned, see About Controlling Access to ThinApp Applications.

To specify control access via Active Directory on the General Settings page, perform the following steps:

Task  To specify control access via Active Directory:

1. In the ThinApp Assistant, open the General Settings page.

2. Select the Control Access via Active Directory option. The fields below are enabled.

3. In the Allow application execution to the following user groups field, enter the names of all of the Active Directory groups that you want to have permission to run this ThinApp application, separated by semi-colons, such as:

   GroupOne;GroupTwo;GroupThree
4. In the **Message shown when users not belonging to above groups run the ThinApp application**, enter the message that will be displayed when users that do not belong to the specified groups attempt to launch a ThinApp application.

⚠️ **Caution** • If you do not select the **Control Access via Active Directory** option, anyone who has access to a directory containing a ThinApp application will be able to run the application.

### About Controlling Access to ThinApp Applications

Note the following about controlling access to ThinApp applications via Active Directory:

- **You must be connected**—You must be connected to your Active Directory domain when you build the ThinApp application.
- **Groups must exist**—The Active Directory groups that you specify must exist when the ThinApp application is built.
- **If you delete a group and then recreate it, you must rebuild**—If you delete a group and recreate it, you will need to rebuild the ThinApp application in order to authenticate against the “new” group.
- **Offline users can authenticate using cached credentials**—When users are offline, they can authenticate using cached credentials. Assuming that the user can log into their laptop, ThinApp Active Directory authentication will still work.
- **Sometimes you may need to update credentials manually**—Cached credentials may not refresh on clients until the next Active Directory refresh cycle. To manually refresh the cached group policy credentials, you can use the `gpupdate` command. Sometimes the user may need to log-off before the credentials are recached.
- **“Administrators” and “Everyone” Groups use same credentials**—Special groups like Administrators and Everyone have the same SID on every Active Directory domain and Workgroup. Other groups you create will have a domain-specific SID, meaning a user cannot create their own local group with the same name to bypass authentication.

### Prerequisites for Building a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

AdminStudio will convert the package installation into a format compatible with ThinApp. However, the ThinApp build process requires the availability of certain ThinApp tools.

As a prerequisite to building a ThinApp application from AdminStudio, you must have installed ThinApp and accepted any and all license agreements.

Note • For more information, see ThinApp on the VMware Web site.

Note • For more information, see ThinApp on the VMware Web site.
Including Diagnostic Tools With a ThinApp Application

On the **Diagnostic Tools** dialog box, which is opened by selecting **Diagnostic Tools** in the **More Options** list on the **General Settings** page, you can choose to include the Registry Editor and the Windows Command Prompt diagnostic tools with your ThinApp application.

If you include diagnostic tools with your ThinApp application, you will be able to look at the registry or file system for the application while it is running in its virtual environment. For example, if you were running a ThinApp application and got an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

**Caution** • If you choose to include these diagnostic tools, the versions of `regedit.exe` and `cmd.exe` that are part of the operating system on the build machine are added to the ThinApp application. However, these tools may not be compatible with other operating systems.

---

**Task**

**To include diagnostic tools with a ThinApp application:**

1. In the **ThinApp Assistant**, open the **General Settings** page.
2. In the **More Options** list, click **Diagnostic Tools**. The **Diagnostic Tools** dialog box opens.
3. If you want to include the Registry Editor (regedit.exe) with your ThinApp application so that you can browse the registry at runtime from within the virtual environment, select the **Registry Diagnostics** option.
4. If you want to include the Windows Command Prompt application with your ThinApp application so that you can browse the virtual file system at runtime from within the virtual environment, select the **File System Diagnostics** option.

**Launching the Diagnostic Tools Within the Virtual Environment**

If you selected the **Registry Diagnostics** or **File System Diagnostics** options on the **Diagnostic Tools** dialog box, shortcuts to those tools are automatically added to the ThinApp application.

When the user runs this ThinApp application, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:
Managing Files and Folders in a ThinApp Application

The directories in the destination tree on the Files & Folders page of the ThinApp Assistant represent how your application will look when it is installed on to your customer’s machine.

On the Files & Folders page, you can view all of the files and folders that are currently in your ThinApp application, add new files and folders to include in the ThinApp application, and delete files and folders from the ThinApp application.

- Adding Files to a Citrix Profile
- Adding an Existing Folder (and its Contents) to a Citrix Profile
- Creating a New Folder
- Moving Files and Folders
- Deleting Files and Folders

Adding Files to a ThinApp Application

To add files to a ThinApp application, perform the following steps:
Creating Customized Virtual Applications

Creating ThinApp Applications

Task To add a file to a ThinApp application:

1. In the ThinApp Assistant, open the Files & Folders page. The files and folders are listed in the VMware ThinApp Application tree, organized by installation directory.

![Folder with a custom isolation option](image)

Folders are listed in the column on the left, and all of the files in the selected folder are listed on the right. Blue folders are the supported MSI standard folders. The folder with the check mark is INSTALLDIR, which represents the main product installation directory.

2. Browse through the folder tree to find the folder that you would like to add files to.

3. Select the folder and click the Add Files button. The Open dialog box opens.

4. Select the file or files that you want to add and click Open. The files you selected are now listed.

Tip • To select multiple files, use the Shift key (for contiguous files) or the Ctrl key (for non-contiguous files).

Adding a File by Dragging and Dropping Files From Your System

You can also add files or folders to your ThinApp application on the Files & Folders page by dragging them from a directory on your computer to the desired location in the tree.

Adding an Existing Folder (and its Contents) to a ThinApp Application

To add an existing folder and all of the files and subfolders within it to a ThinApp application, perform the following steps:
Task: To add an existing folder to a ThinApp application:

1. In the ThinApp Assistant, open the Files & Folders page. The files and folders are listed in the ThinApp Application tree, organized by installation directory.

   ![ThinApp Assistant screenshot](image)

   ![ThinApp Application tree](image)

2. Browse through the folder tree to find the folder that you would like to add a folder into.

3. Select the folder and click the Add Folders button. The Browse for Folder dialog box opens, listing all of the directories available to your computer.

   ![Browse for Folder](image)

4. Select a folder and click OK.

   If you are editing an InstallShield project (not a Windows Installer package), you are prompted to choose whether you want to create a dynamic file link to the source folder.
Creating Customized Virtual Applications

Creating ThinApp Applications

5. Indicate whether you want to create a dynamic file link by selecting one of the following:

- **No**—For more flexibility with ThinApp options, it is recommended that you select *No* to indicate that you *do not* want to use a dynamic file link, because you would then not be able to customize isolation options for any of the items in this folder.

- **Yes**—If you wish to use the default isolation options for all the files and folders under this folder, then select the dynamic file link option by clicking *Yes*. The *Dynamic File Link Settings* dialog box would then open, prompting you to specify the source folder for your dynamic link, and to set options regarding which files and folders to include in the dynamic link. See Dynamic File Link Settings Dialog Box.

The folder that you selected is now listed, along with of the files and folders within it.

Creating a New Folder

You can create a new, empty folder by selecting an existing folder in the tree and selecting *New Folder* from the context menu.

**Task**  
To create a new folder:

1. Right-click on a folder in the VMware ThinApp Application tree and select *New Folder*. A new folder is created as a subfolder of the selected folder:

2. Enter a name for the new folder.

Moving Files and Folders

To change the folder’s location in the ThinApp application folder tree structure, perform the following steps:

**Task**  
To move a file or folder:

1. Select the file or folder that you want to move.
2. With the mouse button down, drag the file or folder to the new location.
3. Release the mouse button.
Deleting Files and Folders

To delete a file or a folder (and all of its contents) from a ThinApp application, perform the following steps:

1. Select the file or folder in the **VMware ThinApp Application** tree that you want to delete.
2. Select **Delete** from the context menu. You are prompted to confirm the deletion.
3. Click **Yes**. The selected file or folder is deleted.

**Caution** • If you choose to delete a folder, you are also deleting all of the files and subfolders that the folder contains from the entire Project, not just from the ThinApp application.

**Note** • You cannot delete predefined folders. You can only turn off the display of those folders. For more information, see Controlling the Display of Predefined Folders.

Controlling the Display of Predefined Folders

On the **Files & Folders** page, the **VMware ThinApp Application** tree initially displays the more commonly used predefined folders, such as \[ProgramFilesFolder\] and \[CommonFilesFolder\].

These predefined folders are dynamic, meaning that they do not use hard-coded paths. The value for each destination folder is obtained from the operating system of the target machine.

You can control which predefined folders are listed in this tree.
Task To change which predefined folders are listed:

1. In the VMware ThinApp Application tree, select the ThinApp Application node (or any of the files or folders that are listed, point to Show Predefined Folder. A list of predefined folders opens.

Those folders that are already displayed are preceded by a check mark, and those that are not displayed do not have a check mark.

2. To add a folder to the tree listing, select a folder that is not currently listed in the tree.

Note • These predefined folders are always added to the root of the VMware ThinApp Application tree, no matter what file or folder you had selected when you selected it from the Predefined Folders list.

3. To remove a folder from the tree listing, select that folder name in this list (which is preceded by a check mark).

Note • You cannot turn off the display of the [ProgramFilesFolder].
Setting ThinApp Isolation Options

AdminStudio 2019 | ThinApp Assistant

ThinApp uses a sandbox virtual environment to control application compatibility and accessibility. The isolation option that is assigned to a folder or registry key specifies how the virtual environment will provide access to system resources requested by the application. You can use isolation options to control what an application can read and write on the local machine.

The default settings for isolation options are built into the ThinApp Assistant, and those defaults are adequate for most environments. However, in the ThinApp Assistant, you can override the default settings for selected folders or registry keys to exert control over application interactions with client operating system resources.

You set isolation options on the Isolation Options dialog box, which is open by selecting a folder or registry key and then selecting Isolation Options from the context menu.

Information about setting isolation options is presented in the following topics:

- Overview of Citrix Isolation Options
- Setting Isolation Options for Folders and Files
- Inheritance of Isolation Options from Folders to Files

Caution • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects, ThinApp, and registry settings.

Overview of ThinApp Isolation Options

AdminStudio 2019 | ThinApp Assistant

ThinApp uses virtual environments to control application compatibility and accessibility. The isolation option that is assigned to a folder or registry key specifies how the virtual environment will provide access to system resources requested by the application.

The default settings for isolation options are built into the ThinApp Assistant, and those defaults are adequate for most environments. However, in the ThinApp Assistant, you can override the default settings for selected folders or registry keys to exert control over application interactions with client operating system resources.

Caution • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects, ThinApp, and registry settings. Select the Default isolation option unless you require specific custom handling.

You set isolation options on the Isolation Options dialog box, which is opened by selecting Isolation Options on the context menu when you have a folder selected on the Files & Folders page or a registry key selected on the Registry page.

Information about isolation options is presented in the following sections:

- Available ThinApp Isolation Options
- ThinApp Isolation Option Use Scenarios
- ThinApp Assistant Default Isolation Options
Available ThinApp Isolation Options

On the Isolation Options dialog box, you can choose one of the following isolation options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Visibility of System Elements</th>
<th>Modifications to Virtual Elements</th>
<th>Modifications to System Elements</th>
<th>New Elements</th>
<th>If System and Virtual Element at Same Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>As defined internally by the ThinApp Assistant</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Write Copy</td>
<td>Visible</td>
<td>Sandbox</td>
<td>Sandbox</td>
<td>Created in Sandbox</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Merged</td>
<td>Visible</td>
<td>Sandbox</td>
<td>System</td>
<td>Created in System</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Full</td>
<td>Not Visible</td>
<td>Sandbox</td>
<td>N/A (System elements cannot be modified)</td>
<td>Created in Sandbox</td>
<td>N/A (System elements cannot be read)</td>
</tr>
</tbody>
</table>

ThinApp Isolation Option Use Scenarios

The following table describes scenarios where you would use each isolation option:

Table 12-45 • Use Scenarios for ThinApp Isolation Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Use Scenario</th>
</tr>
</thead>
</table>
| Write Copy | You would use Write Copy isolation when:  
- Application was not designed or tested for multi-user environments and expects it can modify files and keys without impacting other users.  
- Application expects write permission to Global locations and was not designed for locked-down desktop environments found in corporate environments or Windows Vista.  
With Write Copy isolation, ThinApp makes copies of registry keys and files written by the application and performs all of the modifications in a user-specific sandbox. With this type of isolation, the ThinApp applications believe that they have global write permissions, while they really only modify the sandbox directory. |
| Merged | You would use Merged isolation when the ThinApp application needs write access to user-specific storage areas, like the Desktop and My Documents. |
| Full | You would use Full isolation when a ThinApp application needs to run on a machine where earlier or later versions of the same application are either installed or were not uninstalled correctly.  
For directories and registry keys that have Full isolation, the ThinApp application will not be aware of any host computer file that might exist, and it sees only virtual files and registry keys at fully isolated locations. |
ThinApp Assistant Default Isolation Options

If you do not set any isolation options on a folder or registry key in the ThinApp Assistant, the following default isolation options are applied:

<table>
<thead>
<tr>
<th>Isolation Option</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write Copy Isolation</td>
<td>All other directories and subkeys associated with the product are assigned Write Copy isolation.</td>
</tr>
<tr>
<td>Merged Isolation</td>
<td>User-specific storage areas like the Desktop and My Documents, are set to Merged Isolation so that application has direct Write access to these locations</td>
</tr>
</tbody>
</table>

Note • Network shares are not affected by isolation modes. Read and write operations to network shares occur unchanged by ThinApp.

Note • These default isolation options are built into the ThinApp Assistant.

Setting Isolation Options for Folders

AdminStudio 2019 | ThinApp Assistant

To override a folder’s default isolation options, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To set an isolation option on a folder.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Files &amp; Folders page.</td>
</tr>
<tr>
<td>2.</td>
<td>Browse through the folder tree to find the folder that you would like to modify.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the folder and click Isolation Options on the context menu. The Isolation Options dialog box opens.</td>
</tr>
<tr>
<td>4.</td>
<td>Select one of the following options, as described in ThinApp Isolation Options.</td>
</tr>
<tr>
<td></td>
<td>• Default</td>

<td>• Merged</td>
</tr>
<tr>
<td>5.</td>
<td>Click OK. Folders that have an isolation setting other than default are marked with a special icon:</td>
</tr>
</tbody>
</table>
Inheritance of Isolation Options from Folders to Files

Isolation options for files and subfolders are always inherited. The ThinApp virtual environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for `C:\Windows` and one for `C:\Windows\System32`. When the application requests `C:\Windows\System32\Notepad.exe`, then the `C:\Windows\System32` isolation rule will be applied because `C:\Windows\System32` is a more specific reference to `C:\Windows\System32\Notepad.exe` than is `C:\Windows`.

```
  WINDOWS [Ignore]
  system32 [Isolate]
      notepad.exe [Isolate]
```

**Figure 12-30**: Example of Inheritance of Isolation Options from Folders to Files

Modifying Shortcuts to the ThinApp Application’s Executable Files

You define application shortcuts to enable users to launch a ThinApp application from within the virtual environment.

By default, the **ThinApp Assistant** creates ThinApp applications for all of the executable shortcuts that exist in your project (or Windows Installer package). These shortcuts are listed in a checklist on the **Applications** page.

When you select each shortcut, details about it are displayed:

```
  EZScore4.5
  EZPhotolEdit
```

**Figure 12-31**: List of Shortcuts for an Application
Caution • You must define at least one shortcut to enable users to launch the application from the isolation environment.

On the Applications page, you can create, delete, include, exclude, or rename ThinApp application executables, which are derived from the shortcuts in its Windows Installer package.

- App-V Packages and the Virtual Environment
- App-V Shortcut Requirements
- Creating a New App-V Package
- Including an Existing App-V Shortcut
- Excluding or Deleting an Existing App-V Package
- Renaming a Shortcut

Caution • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

ThinApp Applications and the Virtual Environment

AdminStudio 2019 | ThinApp Assistant

On the Applications page of the ThinApp Assistant, you define application shortcuts to enable users to launch a ThinApp application from within the virtual environment. By default, the ThinApp Assistant creates ThinApp applications for all of the executable shortcuts that exist in your project.

To deploy a ThinApp application—on a local drive or a network share—systems administrators just need to give users access to the ThinApp application.

Compressing a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

A ThinApp application consists of either:

- One executable file (.exe)—This file is used to both launch the ThinApp application and also contain all of the data that is required for the application to run. In this scenario, this executable file would be a large file.

  or

- Several executable files (.exe) and a Package.DAT file—Each of the executables is used to launch the ThinApp application or a specific feature of the ThinApp application and Package.DAT contains all of the data that is required for the application to run. In this scenario, Package.DAT would be a large file.

Each time a user launches a ThinApp application, its data (from either the executable file or from Package.DAT) is read into the computer’s memory. To reduce the application size, you can select a Compression Type on the Build Options page to compress all of the data.
Creating Customized Virtual Applications

Creating ThinApp Applications

Figure 12-32: Compression Types on the Build Options Page

The following Compression Types are available:

Table 12-47: ThinApp Compression Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Do not perform any type of compression.</td>
</tr>
<tr>
<td>Fast</td>
<td>Perform quick compression resulting in a smaller application footprint.</td>
</tr>
<tr>
<td>Small</td>
<td>Perform the best compression resulting in the smallest application footprint, but increasing build time.</td>
</tr>
</tbody>
</table>

Application startup time is most affected by compression options used:

- **No compression**—Without compression enabled, startup speeds are comparable to normal application startup times.
- **Fast compression**—With fast compression options enabled, applications may startup faster than normal when the disk cache is empty and slightly slower than normal when the disk cache has been pre-filled, depending on processor speed and disk speeds.

You may also want to compress a ThinApp application to make it easier to distribute it throughout your organization.

When you perform compressed builds, large temporary files are saved in a cache location. To delete all of these temporary files, select the Clear the VMware ThinApp Cache option in the More Options list on the Build Options page.

ThinApp Shortcut Requirements

AdminStudio 2019 | ThinApp Assistant

For each ThinApp application, you are required to define at least one shortcut. You define application shortcuts to enable users to launch a ThinApp application from within the virtual environment. By default, the ThinApp Assistant creates ThinApp applications for all of the executable shortcuts that exist in your project (or Windows Installer package).

If you build a ThinApp application that does not contain any shortcuts, users will not be able to launch the application.

Creating a New ThinApp Application

AdminStudio 2019 | ThinApp Assistant

On the Applications page of the ThinApp Assistant, you specify the executables that you want to create ThinApp applications for.
Task  To create a new ThinApp application:

1. Open the Applications page. All of the shortcuts that exist in the project (or Windows Installer package) are listed:
   - Those that are currently included in the ThinApp application are selected.
   - Those that are currently excluded from the ThinApp application are not selected.

2. Click New. The Browse for a Shortcut Target File dialog box opens and prompts you to select a file within this ThinApp application.

3. Select the file that you want to create a shortcut to.

4. Click Open. A new shortcut is listed, and it is named the same name as the selected file.

5. To include this shortcut in the ThinApp application, make sure that its check box is selected.

Including an Existing ThinApp Application

AdminStudio 2019 | ThinApp Assistant

If you want to include a previously excluded shortcut in a ThinApp application, perform the following steps:

Task  To include an existing ThinApp application:

1. Open the Applications page. All of the shortcuts that exist in the project are listed.
   - Those that are currently included are selected.
   - Those that are currently excluded are not selected.

2. To include a previously excluded shortcut, select the shortcut and select the check box.

Excluding or Deleting an Existing ThinApp Application

AdminStudio 2019 | ThinApp Assistant

By default, the ThinApp Assistant creates ThinApp applications for all of the executable shortcuts that exist in your project (or Windows Installer package). These shortcuts are listed in a checklist on the Applications page.
Figure 12-33: Initial List of Shortcuts for an Application

To prevent the shortcut from being created in the ThinApp application, you can choose to either delete or exclude it.

- **Excluding a shortcut**—When you exclude a shortcut, it will not be created in the ThinApp application, but it will remain in the InstallShield project. See Excluding a Profile Shortcut.

- **Deleting a shortcut**—When you delete a shortcut, it is removed from both the ThinApp application and the InstallShield project. See Deleting a Shortcut.

**Caution** • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

If you have any unnecessary shortcuts in your project, you can simply exclude them from the ThinApp application by unchecking them in the shortcuts list. If you like to permanently remove a shortcut, you can delete it from the shortcut list.

**Excluding a ThinApp Application**

If you want to exclude one of these shortcuts from being created in the ThinApp application, perform the following steps:

**Task**

To exclude a ThinApp application:

1. Open the Applications page. All of the shortcuts that exist in the project are listed.
   - Those that are currently included are selected.
   - Those that are currently excluded are not selected.

2. To exclude a shortcut, select the shortcut and clear the check box.

**Note** • When you exclude a shortcut, it will not be created in the ThinApp application, but it will remain in the InstallShield project.
Deleting a ThinApp Application

To delete a ThinApp application, perform the following steps.

Task  
To delete a ThinApp application:

1. Open the Applications page. All of the shortcuts that exist in the project are listed.
2. Select the shortcut and click Delete.

Caution • If you delete a shortcut on the Applications page, the shortcut is also deleted from the InstallShield project, and, subsequently, from the Windows Installer package.

Excluding vs. Deleting ThinApp Application Shortcuts

To prevent a shortcut from being created in the ThinApp application, you can choose to either delete or exclude it, depending upon whether you want it to remain in the InstallShield project.

- **Excluding a shortcut**—When you exclude a shortcut, it will not be created in the ThinApp application, but it will remain in the InstallShield project. This means that the shortcut would be included in the Windows Installer package that is built from this InstallShield project. See Excluding a Profile Shortcut.

- **Deleting a shortcut**—When you delete a shortcut, it is removed from both the ThinApp application and the InstallShield project. This means that the shortcut would also be deleted from the Windows Installer package that is built from this InstallShield project. See Deleting a Shortcut.

Renaming a ThinApp Application

To rename a ThinApp application, perform the following steps:

Task  
To rename a ThinApp application:

1. Open the Applications page. All of the shortcuts that exist in the project are listed.
2. Select the shortcut that you want to rename and click Rename. A box appears around the shortcut name, and the shortcut name becomes an editable field.
3. Enter a new name for the shortcut.

Modifying ThinApp Application Registry Settings

Using the ThinApp Assistant, you can view existing registry keys, values, and data, and add or delete registry items in your ThinApp application.
You can also override the default isolation options for selected registry keys. Isolation options specify how the virtual environment will provide access to system resources requested by the application.

Information about modifying registry settings on the **Registry** page includes the following topics:

- **About the Windows Registry**
- **Adding or Deleting Registry Keys and Values**
- **Setting App-V Package Registry Isolation Options**

### About the Windows Registry

AdminStudio 2019 | ThinApp Assistant

The Windows registry is a system-wide database that contains configuration information used by applications and the operating system. The registry stores all kinds of information, including the following:

- Application information such as company name, product name, and version number
- Path information that enables your application to run
- Uninstallation information that enables end users to uninstall the application easily without interfering with other applications on the system
- System-wide file associations for documents created by an application
- License information
- Default settings for application options such as window positions

### Keys, Value Names, and Values

The registry consists of a set of keys arranged hierarchically under the My Computer explorer. Just under My Computer are several root keys. An installation can add keys and values to any root key of the registry. The root keys that are typically affected by installations are:

- HKEY_LOCAL_MACHINE
- HKEY_USERS
- HKEY_CURRENT_USER
- HKEY_CLASSES_ROOT

A key is a named location in the registry. A key can contain a subkey, a value name and value pair, and a default (unnamed) value. A value name and value pair is a two-part data structure under a key. The value name identifies a value for storage under a key, and the value is the actual data associated with a value name. When a value name is unspecified for a value, that value is the default value for that key. Each key can have only one default (unnamed) value.

Note that the terms key and subkey are relative. In the registry, a key that is below another key can be referred to as a subkey or as a key, depending on how you want to refer to it relative to another key in the registry hierarchy.
Adding or Deleting Registry Keys and Values

AdminStudio 2019 | ThinApp Assistant

Editing the registry on the Registry page is performed much like it is performed on the InstallShield Registry view. See Editing the Registry.

About the Windows Registry
Setting App-V Package Registry Isolation Options

Setting ThinApp Isolation Options on Registry Keys

AdminStudio 2019 | ThinApp Assistant

To override a registry key's default isolation options (which are built into the ThinApp Assistant), perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To set an isolation option on a registry key:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Registry page.</td>
</tr>
<tr>
<td>2.</td>
<td>Browse through the registry tree to find the key that you would like to modify.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the folder or key and click Isolation Options on the context menu. The Isolation Options dialog box opens.</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong> • While you cannot explicitly set an isolation option on a registry value, registry values are subject to the isolation options of their keys.</td>
</tr>
<tr>
<td>4.</td>
<td>Select one of the following options, as described in ThinApp Isolation Options.</td>
</tr>
<tr>
<td></td>
<td>• Default</td>
</tr>
<tr>
<td></td>
<td>• Write Copy</td>
</tr>
<tr>
<td></td>
<td>• Merged</td>
</tr>
<tr>
<td></td>
<td>• Full</td>
</tr>
<tr>
<td>5.</td>
<td>Click OK. Registry keys that have an isolation setting other than default are marked with a special icon:</td>
</tr>
</tbody>
</table>

*Tip* • To import an existing registry (.reg) file, click the Import a .reg file option on the More Options list to open the Registry Import Wizard.
Inheritance of ThinApp Isolation Options in the Registry

Inheritance of ThinApp Isolation Options in the Registry

AdminStudio 2019 | ThinApp Assistant

Isolation options for registry keys are always inherited. The ThinApp virtual environment will apply the most specific reference to that resource.

For example, suppose you have an isolation option for the Microsoft registry key and one for Microsoft\Windows registry key. When the application requests Microsoft\Windows\CurrentVersion, then the Microsoft\Windows isolation rule will be applied because Microsoft\Windows is a more specific reference to Microsoft\Windows\CurrentVersion than is Microsoft.

![HKEY_LOCAL_MACHINE](image)

**Figure 12-34:** Example of Inheritance of Isolation Options from Folders to Files

Modifying Build Options

AdminStudio 2019 | ThinApp Assistant

On the **Build Options** page, you choose which releases of this InstallShield project you want to build a ThinApp application for when the project is built, specify the type of compression, disable the ThinApp Log Monitor tracing capabilities, and specify whether you want to include additional Windows Installer packages in the virtual package.

Also, if you are editing a Windows Installer package in Direct Edit mode (or Direct MST mode), you need to select the **Build ThinApp Application** option on the **Build Options** page before you will be able to build a ThinApp application for that Windows Installer package.

- Selecting the Releases for Which You Want to Build App-V Packages
- Enabling App-V Package Building When in Direct Edit Mode
- Including Additional Windows Installer Packages in a ThinApp Application
- Building a Windows Installer Package to Assist in the Distribution of a ThinApp Application
- Setting ThinApp Log Monitor Tracing Options
- Setting AppLink Options
- Setting AppSync Options

**Important** • You must create at least one Release (on the **Releases** view of the Installation Designer) before you will be able to select a Release on the **Build Options** page.
Selecting Releases to Build

AdminStudio 2019 | ThinApp Assistant

You select the releases that you want to build a ThinApp application for on the Releases tree of the Build Options page.

**Important** • You cannot create or edit a release in the ThinApp Assistant. If no releases exist, you can simply click the Build toolbar button to create a new release or open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build a ThinApp application. For more information, see Creating and Building Releases.

If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the Releases tree on the Build Options page is not displayed.

**Task**

To select releases to build:

1. Open the Build Options page.
2. Select the releases in the Releases tree that you want to build a ThinApp application for.

**Important** • When you select a release on the Build Options page, you are specifying that whenever you build that particular release, you want to also build a ThinApp application for that release. However, the releases that are selected on the Build Options page have no bearing upon which release is built when you click the Build button on the toolbar. When you initiate a build by clicking the Build button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer Releases view. The output of that build would depend upon what releases were selected on the Build Options page:

- **Active release selected**—A Windows Installer package and a ThinApp application would be built.
- **Active release not selected**—Only a Windows Installer package would be built.

**Note** • To build more than one release at a time, perform a batch build. See Performing Batch Builds.

Build Settings Page

Enabling ThinApp Application Building When in Direct Edit Mode

AdminStudio 2019 | ThinApp Assistant

When you are editing a Windows Installer (.msi) package or a transform (.mst) file in the ThinApp Assistant, you are in Direct Edit Mode or Direct MST Mode. Because you are directly editing a Windows Installer package, you save your changes by selecting Save on the File menu. It is not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled.

However, you do need to run the build process to build a ThinApp application for this Windows Installer package. To do this, perform the following steps:
Chapter 12  Creating Customized Virtual Applications
Creating ThinApp Applications

Task  To enable ThinApp application building when in Direct Edit Mode:

1. Open a Windows Installer package or a transform file in InstallShield. It will be opened in Direct Edit Mode or Direct MST Mode, and the Build function (Build on the Build menu and the Build toolbar button) will be disabled.

2. Open the Build Options page of the ThinApp Assistant.

3. Select the Build ThinApp application option. After you select this option, the Build ThinApp application selection on the Build menu becomes enabled, as does the Build toolbar button.

Including Additional Windows Installer Packages in a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. In addition to being able to convert a single Windows Installer package to a virtual package, you can also use the ThinApp Assistant to convert an application suite of multiple Windows Installer packages into one virtual package.

To include additional Windows Installer packages in a ThinApp application, set the Would you like to include additional MSI files in the virtual package? option on the Build Options page to Yes, and then select the packages that you want to add.

Task  To include additional Windows installer packages in a ThinApp application:

1. Open the Build Options page.

2. Set the Would you like to include additional MSI files in the virtual package? option to Yes.

3. Click the New button ( ) and select the Windows Installer packages that you want to add. After each file is selected, it will be listed in the Windows Installer Files (.msi) list.

   - The order of the packages can be changed by selecting a package in the list and clicking the Move Up ( ) and Move Down ( ) buttons.

   - Use the Delete button ( ) to delete a package from the list.

Building a Windows Installer Package to Assist in the Distribution of a ThinApp Application

AdminStudio 2019 | ThinApp Assistant

You can choose to build a Windows Installer package to assist in the distribution of a ThinApp application. This simplifies the deployment of a ThinApp application by enabling you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management.

To build a Windows Installer file with your ThinApp application, select the Generate a Windows Installer (MSI) file as part of the build output option on the Build Options page of the ThinApp Assistant. By default, this option is not selected.

This Windows Installer file can be run to properly install the ThinApp application on an end-user’s desktop. A ThinApp application installed using a Windows Installer package can be uninstalled using Add or Remove Programs in the Control Panel.
Setting ThinApp Log Monitor Tracing Options

AdminStudio 2019 | ThinApp Assistant

ThinApp Log Monitor is an application in the ThinApp Suite that allows you to record detailed information about any application’s execution history for later review. The following events are recorded:

- **API calls**—Win32 API calls with parameter and result information made by applications running in the ThinApp virtual operating system
- **Errors**—A list of potential errors, exceptions, and security events within the application
- **Loaded DLLs**—A list of all DLLs loaded by the application and address ranges

Log Monitor is launched by selecting a shortcut in the ThinApp Suite group on the Windows Start menu.

![ThinApp Log Monitor](image)

*Figure 12-35: ThinApp Log Monitor*
Log Monitor displays the following information:

**Table 12-48 • ThinApp Log Monitor Interface**

<table>
<thead>
<tr>
<th>#</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Process List</td>
<td>Any new ThinApp process which has been started after Log Monitor begins will be listed. If you click on one of the processes, the Input Trace File and Output Report Filename fields are automatically populated.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> • If the application was built with the Disable Log Monitor Tracing option on the Build Options page selected, it will not be listed.</td>
</tr>
<tr>
<td>2</td>
<td>Delete</td>
<td>Click to delete trace files for the selected processes in the Process List.</td>
</tr>
<tr>
<td>3</td>
<td>Kill</td>
<td>Click to kill currently running process that is selected in the Process List. You would do this to stop a process from logging additional entries once an error condition has been reached.</td>
</tr>
<tr>
<td>4</td>
<td>Input Trace File</td>
<td>Click Browse to manually browse for a trace file to convert.</td>
</tr>
<tr>
<td>5</td>
<td>Output Report File</td>
<td>The file listed in this field is generated when you click Generate text trace report. This report should be viewed with a text editor that supports UNIX-style line breaks such as Wordpad or Word (not Notepad).</td>
</tr>
</tbody>
</table>

**Disabling Log Monitor Tracing**

If you do not want to allow ThinApp Log Monitor tracing in a ThinApp application, select the Disable Log Monitor Tracing option on the Build Options page.

**Task**

To disabling the ThinApp Log Monitor tracing capabilities:

1. Open the Build Options page.
2. Select the Disable Log Monitor Tracing option.
3. Build the ThinApp application.

**Setting AppLink Options**

**Note** • The AppLink Settings feature requires ThinApp 4.x. If you are using Thinstall 3.x, any AppLink settings that you define will be ignored.

The AppLink (Application Link) feature enables you to configure relationships between ThinApp applications that work together. You can set AppLink settings for the current ThinApp application on the AppLink Settings dialog box, which is opened by clicking the AppLink Settings option in the More Options menu of the ThinApp Assistant Build Options page.
You can use the AppLink feature to perform the following tasks:

- **Linking runtime components to applications**—You can link runtime components to the applications that use them. For example, you can link a package containing the Java runtime environment (JRE) or ODBC drivers to a package containing a browser application.

- **Linking add-ons and plug-ins to applications**—You can link add-ons and plug-ins to applications. For example, Microsoft Office add-ons can be linked to applications or Adobe Photoshop plug-ins can be linked to a package containing Photoshop.

- **Linking packaged applications to service packs**—You can link packaged applications to service packs. By using AppLink, you can upgrade or roll back your service packs by changing the service pack that you capture and link to its parent application.

To set AppLink options for a ThinApp application, perform the following steps.

**Task** **To configure AppLink settings for your ThinApp application:**

1. On the Build Settings page of the ThinApp Assistant, click the AppLink Settings option in the More Options menu. The AppLink Settings dialog box opens.

2. Click the Browse button to open the Add AppLink Reference dialog box.

3. In the ThinApp Reference box, enter the relative (runtime) path to the existing ThinApp application that you want to link to.
   - If you want to add multiple applications, repeat the procedure as necessary.
• You can also use wild cards. See Security and Authorization

• The order in which packages are imported can be changed by selecting a package and clicking the up and down arrows. See Collisions and Order of Import for more information on order.

**Note** • Required and Optional links are listed on the AppLink Settings dialog box together and the order can be changed using the up and down arrows. However, at runtime, all of the applications in the Required category are read first, before those in the Optional category, even if applications in the Optional category were originally higher in the list. When the AppLink Settings dialog box is reopened, the AppLink References will be grouped by category rather than be in the order that was arranged prior to closing the dialog box. In other words, the category order (Required and Optional) overrides the order set by the user.

• To delete a package you have added, select the package and click the Delete (x) button.

**Important** • When linking to a ThinApp application that has only one shortcut, select its .EXE file. When linking to a ThinApp application that has more than one shortcut, select either its Package.DAT file (if the ThinApp application was built with AdminStudio) or its primary executable file (if the ThinApp application was built with ThinApp).

**Important** • On the Add AppLink Reference dialog box, if you click Browse and browse for a ThinApp application, the absolute path to that application is entered, such as C:\Program Files\AppName\filename.exe. In that case, the parent ThinApp application needs that linked application to be found at the specified absolute path location at runtime, which is unlikely. Therefore, it is recommended that you enter a relative path name.

4. If you want this package to be required, select the Required option. If a required package is missing from the virtual package, it will fail to run. Note the following about required packages:

  • If any specified package fails to import, an error message will be displayed and the parent executable file will exit.

  • If a wildcard pattern is used to specify a package, no error message is displayed if no files match the wildcard pattern. Therefore, if a wildcard pattern is used to specify a package, the reference is always optional.

  • To continue even if load errors occur, make the package references optional instead.

5. Click OK to return to the AppLink References dialog box. The item you selected is now listed in the AppLink References list.

6. Click OK to return to the Build Options page.

**See Also**
AppLink Settings Dialog Box
Add AppLink Reference Dialog Box

Setting AppSync Options

**Note** • The AppSync Settings feature requires ThinApp 4.x. If you are using Thinstall 3.x, any AppSync settings that you define will be ignored.
AppSync (Application Sync) enables you to automatically keep deployed ThinApp applications up to date. When an application starts up, AppSync can query a Web server to see if an updated version of the package is available. If an update is available, the differences between the existing package and the new package will be downloaded and used to construct an updated version of the package. The updated package will be used for future deployments.

You can use the AppSync feature to perform the following tasks:

- **Distribute runtime components separately**—You can use AppSync to distribute runtime components separately from the applications that use them. For example, the Java Runtime Environment (JRE) or ODBC drivers.

- **Apply layered service packs to applications**—You can use AppSync to apply layered service packs to your applications. Application Sync enables you to distribute service packs and roll back to previous versions, if necessary.

On the AppSync Settings dialog box, you specify the location of the update, the message displayed to the user, and the expiration settings. You set AppSync settings for the current ThinApp application on the **Build Options** page of the ThinApp Assistant. To configure AppSync settings for a ThinApp application, perform the following steps:

**Task**

To configure AppSync settings for your ThinApp application,

1. On the **Build Settings** page, click the **AppSync Settings** option in the **More Options** menu. The **General** tab of the **AppSync Settings** dialog box opens.

2. In the **Url** field, specify the location of the Web server that hosts application updates. When entering the URL, consider the following:
   - **Supports HTTP and HTTPS**—Application Sync works over both the HTTP (unsecure) and HTTPS (secure) protocol.
   - **Can include login information**—You can include a user name and password in the URL that will be used for basic authentication. The standard Windows/Internet Explorer proxy setting is respected. For example:

     https://www.example.com/some/path/PackageName.exe

3. In the **Message** field, enter the information you want to display to the user when the ThinApp application is updated. By default, the following is entered:

   The application has been successfully updated.
4. By default, a package will connect to the Web server once per day to see if an updated version is available. You can set the frequency by modifying the **Frequency** setting. For example, to set the **Frequency** to 2 days, enter **2d**. For 2 weeks, enter **2w**, etc.

5. If you want to automatically clear the sandbox after an update, select the **Clear Sandbox** option. By default, this option is not selected.

6. Click **Expiration** to open the **Expiration** tab. On this tab, you can specify that a ThinApp application is required to check for updates at a defined frequency. If the ThinApp application fails to successfully check for updates within that defined frequency, it will fail to run.

![](appsync.png)

7. To require that an application has to check for updates at a specified frequency, select the **Use Application Expiration** option.

8. In the **Expire Period** box, enter the update frequency in minutes (**m**), hours (**h**), or days (**d**). For example:
   - To set the period to 30 days, enter **30d**.
   - To set the period to 72 hours, enter **72h**.
   - If you do not want the package to expire, clear the **Use Application Expiration** check box.

   If the Web server cannot be reached, meaning that the update fails, the package will continue to work until the **Expire Period** is reached. The default setting is 30 days.

9. In the **Warning Period** box, enter the amount of time prior to expiration that the user is first warned. For example, to set the period at 5 days, enter **5d**.

10. In the **Warning Frequency** box, enter the frequency that a warning message will be displayed to the user before the package expires. With the default of one day, the warning message will be displayed once per day only. To configure the warning to pop up on every application launch, enter **0**. To configure it to pop up every 4 days, enter **4d**.

   Note the following about warning frequency:
   - After the warning period has started, the Web server will be checked on every launch of an application, overriding any previous setting.
   - As long as a package has not expired, this parameter checks for new versions and downloads will occur in the background. The user can continue to use the old version.
11. Before the expiration limit has been reached and a ThinApp application is started, it will try to connect to the Web server and check for a new version. If the connection fails, a message box will be shown. The default message is:

This application will become unavailable for use in **Warning_Period** days if it cannot contact its update server. Check your network connection to ensure uninterrupted service.

12. After the expiration limit has been reached and a ThinApp application is started, it will try to connect to the Web server and check for a new version. If the connection fails, the message entered in the **Expiration Message** box will be shown and execution will be terminated. The default message is:

This application has been unable to contact its update server for **Expire_Period** days, so it is unavailable for use. Check your network connection and try again.

**Note** • If you use AppSync, VMware recommends that you disable automatic application updates that are configured in your virtual application. Conflicts might occur between the linked packages and the software that is automatically updated. If an automatic update feature updates an application, it stores the updates in the sandbox. If AppSync then updates the application to a different version, the updates stored in the sandbox take precedence over the files contained in the version that AppSync created. The order of precedence for the update files are those in the sandbox, then the virtual operating system, and then the physical machine.

AppSync Settings Dialog Box

---

**Building a ThinApp Application**

The method for building a ThinApp application depends upon what file you have open—an InstallShield project or a Windows Installer package.

- Building an App-V Package from Within an InstallShield Project
- Building an App-V Package from Within a Windows Installer Package in InstallShield

**Building a ThinApp Application for an InstallShield Project**

To build a ThinApp application for an InstallShield project, perform the following steps:

**Task**  
**To build a ThinApp application for an InstallShield project:**

1. Open the InstallShield project in InstallShield.
2. On the **Releases** view of the Installation Designer, make sure that at least one release has been created, and select the release that you want to build.
Chapter 12 Creating Customized Virtual Applications

Creating ThinApp Applications

Important • You cannot create or edit a release in the ThinApp Assistant. If no releases exist, or if you want to create a new release, open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build a ThinApp application. For more information, see Creating and Building Releases.

3. Open the Build Options page of the ThinApp Assistant.

4. In the Releases tree, select the same release that is selected on the Releases view of the InstallShield Installation Designer. This is the release that you will build a ThinApp application for.

Important • When you select a release on the Build Options page, you are specifying that whenever you build that particular release, you want to also build a ThinApp application for that release. However, the releases that are selected on the Build Options page have no bearing upon which release is built when you click the Build button on the toolbar. When you initiate a build by clicking the Build button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer Releases view. The output of that build would depend upon what was selected on the Build Options page:

- Active release selected—A Windows Installer package and a ThinApp application would be built.
- Active release not selected—Only a Windows Installer package would be built.

To build more than one release at a time, perform a batch build. See Performing Batch Builds.

5. Click the Build toolbar button (or select Build Release on the Build menu) to start building the active release.

The output of the build will be a Windows Installer package and a ThinApp application. For information on the files included in a ThinApp application, see Components of an App-V Package.

Building a ThinApp Application for a Windows Installer Package

To build a ThinApp application for a Windows Installer package, perform the following steps:

Task | To build a ThinApp application for a Windows Installer package:
---|---
1. Do one of the following to open a Windows Installer package:
   - On the File menu, select Open and select a Windows Installer package (.msi).
   - On the File menu, select Open and select a transform file (.mst). The Open Transform Wizard opens and you are prompted to identify the transform file’s associated Windows Installer package.
   - On the File menu, select New to open the New Project dialog box. Select Transform and click OK. The Open Transform Wizard opens and you are prompted to identify the transform file’s associated Windows Installer package.
2. Use the Installation Designer to make any desired edits to the Windows Installer package or Transform file, and use the ThinApp Assistant to set ThinApp application options.
3. Save the edits to the Windows Installer package or transform file by selecting Save on the File menu.
4. On the Build Options page of the ThinApp Assistant, select the Build ThinApp application option. The Build Virtual Package button is enabled.
5. Click the Build Virtual Package button to start building the ThinApp application.
Chapter 12  Creating Customized Virtual Applications
Creating ThinApp Applications

The output of the build will be a ThinApp application. For information on the files includes in a ThinApp application, see Components of an App-V Package.

**Note** - For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see Virtualization Conversion Errors and Warnings.

ThinApp Assistant Reference

AdminStudio 2019 | ThinApp Assistant
Reference information about the ThinApp Assistant is organized into the following sections:

- Microsoft App-V Assistant Pages
- Microsoft App-V Assistant Dialog Boxes
- Building App-V Packages Through the Command Line
- Troubleshooting the Builds of App-V Packages
- Application Features that Require Pre- or Post-Conversion Actions

Pages

AdminStudio 2019 | ThinApp Assistant
The ThinApp Assistant is comprised of the following pages:

- Home Page
- Profile Information Page
- Profile Files Page
- Profile Shortcuts Page
- Profile Registry Page
- Build Settings Page

ThinApp Assistant Home Page

AdminStudio 2019 | ThinApp Assistant
The ThinApp Assistant Home page displays a diagram that illustrates the process of creating a ThinApp application.
Figure 12-36: ThinApp Assistant Home Page

Click the following icons in the navigation bar at the bottom of the page to navigate through the ThinApp Assistant interface:

Table 12-49 • Navigation Bar Icons

General Settings Page

AdminStudio 2019 | ThinApp Assistant

On the General Settings page in the ThinApp Assistant, you specify Sandbox options, including options to control access to the ThinApp application using Active Directory.
Chapter 12  Creating Customized Virtual Applications

Creating ThinApp Applications

1520

Figure 12-37: ThinApp Assistant General Settings Page

The General Settings page includes the following options:

Table 12-50 • General Settings Page

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sandbox Name</td>
<td>When a ThinApp application is built, a Sandbox cache is created in the following location: c:_documents &amp; Settings_USER_NAME_Application Data_ThinApp_SANDBOX_NAME By default, AdminStudio names the Sandbox by assigning it a unique GUID. However, if you want to override this default Sandbox name, you may (optionally) enter a new name in the Sandbox Name field.</td>
</tr>
<tr>
<td>Mapped Network Drive Changes go to Sandbox</td>
<td>Enable this option if you want changes for Network mapped drives to be saved in the sandbox. By default, users can read and write normally to network mapped drives.</td>
</tr>
<tr>
<td>Removable Disk Changes go to Sandbox</td>
<td>Enable this option if you want changes for removable disks to be saved in the sandbox. By default users can read and write normally to removable disks.</td>
</tr>
<tr>
<td>Reset Sandbox on Exit</td>
<td>Select this option to delete the sandbox content when the application exits. This resets the ThinApp application to its original captured state.</td>
</tr>
</tbody>
</table>
For testing purposes, you can also choose to include diagnostic tools in your ThinApp application by selecting the Diagnostic Tools link in the More Options list. For more information, see Diagnostic Tools Dialog Box.

Specifying Control Access via Active Directory
Including Diagnostic Tools in an App-V Package

Files & Folders Page

On the Files & Folders page of the ThinApp Assistant, you can perform the following tasks:

- View Files and Folders
- Add Files and Folders
- Delete Files and Folders
- Set Isolation Options
- Modifying the Display of Predefined Folders
View Files and Folders

On the Files & Folders page, you can view all of the files and folders that are currently in your ThinApp application.

Add Files and Folders

On the Files & Folders page, you can use the Add Files and Add Folders buttons to add new files and folders to include in the ThinApp application. See Adding, Deleting, and Moving Files and Folders in an App-V Package.

If you are editing an InstallShield project (not a Windows Installer package), and you are adding a folder to this ThinApp application, you are prompted to choose whether you want to create a dynamic file link to the source folder.
Chapter 12  Creating Customized Virtual Applications

Creating ThinApp Applications

Figure 12-39: Dynamic File Link Option Dialog Box

Indicate whether you want to create a dynamic file link by selecting one of the following:

- **No**—For more flexibility with ThinApp options, it is recommended that you select **No** to indicate that you do not want to use a dynamic file link, because you would then not be able to customize isolation options for any of the items in this folder.

- **Yes**—If you wish to use the default isolation options for all the files and folders under this folder, then select the dynamic file link option by clicking **Yes**. The **Dynamic File Link Settings** dialog box would then open, prompting you to specify the source folder for your dynamic link, and to set options regarding which files and folders to include in the dynamic link. See Dynamic File Link Settings Dialog Box.

Delete Files and Folders

You can delete files and folders from the ThinApp application by selecting the file or folder you want to delete, and selecting **Delete** from the context menu. For more information, see Deleting Files and Folders.

⚠️ **Caution** • If you choose to delete a folder, you are also deleting all of the files and subfolders that the folder contains.

>Note • You cannot delete predefined folders. You can only turn off the display of those folders. For more information, see Controlling the Display of Predefined Folders.

💡 **Tip** • To select multiple files, use the Shift key (for contiguous files) or the Ctrl key (for non-contiguous files).

Set Isolation Options

ThinApp uses a sandbox virtual environment to control application compatibility and accessibility. The isolation option that is assigned to a folder or registry key specifies how the virtual environment will provide access to system resources requested by the application.

The default settings for isolation options are built into the ThinApp Assistant, and those defaults are adequate for most environments. However, you can override the default settings for selected files, folders, or registry keys to exert control over application interactions with client operating system resources.

You set isolation options by selecting a file or folder and then selecting **Isolation Options** from the context menu. For an overview of the available isolation options, and for instructions on how to set them, see Setting Isolation Options.
Modifying the Display of Predefined Folders

You can specify which of the Windows Installer predefined folders are listed in the VMware ThinApp Application tree. See Controlling the Display of Predefined Folders.

See Also
Adding, Deleting, and Moving Files and Folders in an App-V Package
Controlling the Display of Predefined Folders
Setting Isolation Options for Folders and Files

Applications Page

AdminStudio 2019 | ThinApp Assistant

You define shortcuts to enable users to launch a ThinApp application from within the sandbox virtual environment.

By default, the ThinApp Assistant creates ThinApp applications for all of the executable shortcut that exist in your project. The project’s shortcuts are listed in a checklist on the Applications page.

Figure 12-40: ThinApp Assistant Applications Page

Shortcut Requirements

For each ThinApp application, you are required to define at least one shortcut. You define application shortcuts to enable users to launch a ThinApp application from within the virtual environment. By default, the ThinApp Assistant creates ThinApp applications for all of the executable shortcuts that exist in your project (or Windows Installer package).
If you build a ThinApp application that does not contain any shortcuts, users will not be able to launch the application.

**Difference Between Deleting and Excluding a Shortcut**

To prevent a shortcut from being created in the ThinApp application, you can choose to either delete or exclude it, depending upon whether you want it to remain in the InstallShield project.

- **Excluding a shortcut**—When you exclude a shortcut, it will not be created in the ThinApp application, but it will remain in the InstallShield project. This means that the shortcut would be included in the Windows Installer package that is built from this InstallShield project. See [Excluding a Profile Shortcut](#).

- **Deleting a Shortcut**—When you delete a shortcut, it is removed from both the ThinApp application and the InstallShield project. This means that the shortcut would also be deleted from the Windows Installer package that is built from this InstallShield project. See [Deleting a Shortcut](#).

**Managing Shortcuts**

On the **Applications** page, you can create, delete, include, exclude, or rename a ThinApp application. For step-by-step instructions, see the following topics:

- Creating a New App-V Package
- Including an Existing App-V Shortcut
- Excluding or Deleting an Existing App-V Package
- Renaming a Shortcut

**See Also**

Overview of the Citrix Assistant  
Creating a New App-V Package  
Including an Existing App-V Shortcut  
Excluding or Deleting an Existing App-V Package  
Renaming a Shortcut

**Registry Page**

On the **Registry** page, you can view existing registry keys, values, and data, and add or delete registry items. You can also override the default isolation options for a registry key. Isolation options specify how the virtual environment will provide access to system resources requested by the application.

The default settings for isolation options are built into the ThinApp Assistant, and those defaults are adequate for most environments. However, you can override the default settings for selected registry keys to exert control over application interactions with client operating system resources.

You set isolation options by selecting a registry key and then selecting **Isolation Options** from the context menu. For an overview of the available isolation options, and for instructions on how to set them, see [Setting Isolation Options](#).
Creating ThinApp Applications

Figure 12-41: ThinApp Assistant Registry Page

Registry items that are listed on this page will be included in the ThinApp application, and those that you delete will not. By default, all new registry keys are isolated.

Tip • To import an existing registry (.reg) file, click the Import a .reg file option on the More Options list to open the Registry Import Wizard.

Note • You cannot set isolation options on root registry keys.

Editing the registry on the Registry page is performed much like it is performed on the InstallShield Registry View. See Editing the Registry.

For information on how to override a registry key’s default isolation options, see Setting App-V Package Registry Isolation Options.

Important • While you cannot explicitly set an isolation option on a registry value, registry values are subject to the isolation options of their keys.
Build Options Page

On the Build Options page, you can perform the following tasks:

- Specifying Build Options
- Including Additional Windows Installer Packages in a ThinApp Application
- Building a Windows Installer Package to Assist in the Distribution of a ThinApp Application
- Selecting Releases to Build
- Enabling Citrix Profile Building When in Direct Edit Mode
- Clearing the ThinApp Cache
- Opening the ThinApp Application Folder
- Building a Citrix Profile
- Supporting AppSync and AppLink

The options on the Build Options page vary depending upon whether you are editing an InstallShield project or a Windows Installer package:

InstallShield Project

When you open an InstallShield project in InstallShield:

- The Build Options page includes a releases tree, and you select the release that you want to build.
- To build the ThinApp application, you click the Build button on the toolbar.
Figure 12-42: Build Settings Page, When in Basic MSI Project Mode

**Windows Installer Package [Direct Edit Mode]**

When you open a Windows Installer package in InstallShield:

- Because you do not have to select a release for a Windows Installer package, there is no releases tree.
- Because a Windows Installer package has already been built, InstallShield’s standard build functionality is disabled. To build the ThinApp application, select the **Build ThinApp application** option and click the **Build Virtual Package** button.
Specifying Build Options

On the Build Options page, you can specify the following options:

Table 12-51 • ThinApp Application Build Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build ThinApp Application</td>
<td>(Direct Edit/Direct MST Modes Only) When you directly edit a Windows Installer package, it is not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled. Select the Build ThinApp Application option to enable the Build function. When this option is selected, the Build Virtual Package button is enabled. For more information, see Enabling Citrix Profile Building When in Direct Edit Mode.</td>
</tr>
</tbody>
</table>
Table 12-51 • ThinApp Application Build Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Virtual Package</td>
<td>(Direct Edit/Direct MST Modes Only) When you directly edit a Windows Installer package, if you select the <strong>Build ThinApp Application</strong> option, this button is enabled. Click it to build the ThinApp application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This button will also be enabled if the <strong>Build Citrix profile</strong> option is selected on the <strong>Build Settings</strong> page of the Citrix Assistant. In this scenario, if you click this button without also selecting the <strong>Build ThinApp application</strong> option on this page, the ThinApp application will not be built.</td>
</tr>
<tr>
<td>Generate a Windows Installer (MSI) file as part of the build output</td>
<td>You can choose to build a Windows Installer package with your ThinApp application. This enables you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management to distribute your ThinApp application. To build a Windows Installer file with your ThinApp application, select this option. By default, this option is not selected. For more information, see Building a Windows Installer Package to Assist in the Distribution of a ThinApp Application.</td>
</tr>
<tr>
<td>Disable Log Monitor Tracing</td>
<td>Select this option if you do not want to allow ThinApp Log Monitor tracing for a ThinApp application. ThinApp Log Monitor is an application in the ThinApp Suite that allows you to record detailed information about any application’s execution history for later review. For more information, see Setting ThinApp Log Monitor Tracing Options.</td>
</tr>
<tr>
<td>Compression Type</td>
<td>Select one of the following options to specify the ThinApp application’s compression type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: Do not perform any type of compression</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fast</strong>: Perform quick compression resulting in a smaller application footprint</td>
</tr>
<tr>
<td></td>
<td>• <strong>Small</strong>: Perform the best compression resulting in the smallest application footprint, but increasing build time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • For more information, see Compressing a ThinApp Application.</td>
</tr>
<tr>
<td>Would you like to include additional MSI files in the virtual package?</td>
<td>Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. To include additional Windows Installer packages in a ThinApp application, set this option to <strong>Yes</strong>, and then select the packages that you want to add.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • For more information, see Including Additional Windows Installer Packages in a ThinApp Application.</td>
</tr>
</tbody>
</table>
Including Additional Windows Installer Packages in a ThinApp Application

Sometimes a primary Windows Installer package uses other Windows Installer packages indirectly, such as driver files, client components, etc. In addition to being able to convert a single Windows Installer package to a virtual package, you can also use the ThinApp Assistant to convert an application suite of multiple Windows Installer packages into one virtual package.

To include additional Windows Installer packages in a ThinApp application, set the **Would you like to include additional MSI files in the virtual package?** option to Yes, and then select the packages that you want to add.

- Click the New button ( ) and select the Windows Installer packages that you want to add. After each file is selected, it will be listed in the **Windows Installer Files (.msi)** list.
- The order of the packages can be changed by selecting a package in the list and clicking the Move Up ( ) and Move Down ( ) buttons.
- Use the Delete button ( ) to delete a package from the list.

Building a Windows Installer Package to Assist in the Distribution of a ThinApp Application

You can choose to build a Windows Installer package to assist in the distribution of a ThinApp application by selecting the **Generate a Windows Installer (MSI) file as part of the build output** option on the **Build Options** page. By default, this option is not selected.

The Windows Installer file can be run to properly install the ThinApp application on an end-user’s desktop. This simplifies the deployment of a ThinApp application by enabling you to use enterprise distribution tools such as Microsoft System Center Configuration Manager or Novell ZENworks Configuration Management.

A ThinApp application installed using a Windows Installer package can be uninstalled using **Add or Remove Programs** in the Control Panel.

Selecting Releases to Build

You select the releases that you want to build a ThinApp application for on the **Releases** tree of the **Build Options** page. By selecting a release, you are specifying that whenever that particular release is built, a ThinApp application will also be built.

**Note** • If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the **Releases** tree on the **Build Options** page is not displayed.

About Building Releases

When you select a release on the Releases tree on the **Build Options** page, you are specifying that whenever you build that particular release, you want to also build a ThinApp application for that release. However, the releases that are selected on the **Build Options** page have no bearing upon which release is built when you click the **Build** button on the toolbar. When you initiate a build by clicking the **Build** button, a build is initiated for the active release—the release that was most recently selected on the Installation Designer **Releases** view. The output of that build would depend upon what releases were selected on the **Build Options** page:

- **Active release selected**—A Windows Installer package and a ThinApp application would be built.
- **Active release not selected**—Only a Windows Installer package would be built.
Note • To build more than one release at a time, perform a batch build. See Performing Batch Builds.

About Creating Releases

You cannot create or edit a release in the ThinApp Assistant. If no releases exist, you can simply click the Build toolbar button to create a new release or open the Releases view of the InstallShield Installation Designer. You must create at least one release before you will be able to build a ThinApp application. For more information, see Creating and Building Releases.

If you are editing a Windows Installer package (Direct Edit Mode) or transform file (Direct MST Mode), the Releases tree on the Build Options page is not displayed.

Enabling ThinApp Application Building When in Direct Edit Mode

When you are editing a Windows Installer (.msi) package or a transform (.mst) file in the ThinApp Assistant, you are in Direct Edit Mode or Direct MST Mode. Because you are directly editing a Windows Installer package, you save your changes by selecting Save on the File menu. It not necessary to build the package, because it is already built. Therefore, InstallShield’s Build function is disabled.

However, you do need to run the build process to build a ThinApp application for this Windows Installer package. To enable the Build button to build just the ThinApp application, select the Build ThinApp application option on the Build Options page.

After you select this option, the Build ThinApp application selection on the Build menu becomes enabled, as does the Build toolbar button.

Clearing the ThinApp Cache

When you perform compressed builds, large temporary files are saved in a cache location. To delete all of these temporary files, select the Clear the VMware ThinApp Cache option in the More Options list on the Build Options page.

Opening the ThinApp Application Folder

To quickly open the folder containing the ThinApp application files that were generated when this InstallShield project or Windows Installer package was built, click Open ThinApp application folder in the More Options menu.

Building a ThinApp Application

The method for building a ThinApp application depends upon what file you have open—an InstallShield project or a Windows Installer package. For detailed instructions, see one of the following topics:

- Building an App-V Package from Within an InstallShield Project
- Building an App-V Package from Within a Windows Installer Package in InstallShield

Supporting AppSync and AppLink

To configure AppSync and AppLink settings for your ThinApp application, click the AppSync Settings or AppLink Settings option in the More Options menu. For more information, see the AppSync Settings Dialog Box or the AppLink Settings Dialog Box.
Dialog Boxes

AdminStudio 2019 | ThinApp Assistant

The ThinApp Assistant includes the following dialog boxes:

- Diagnostic Tools Dialog Box
- Folder Isolation Options Dialog Box
- Isolation Options Dialog Box (for Registry Keys)
- AppSync Settings Dialog Box
- AppLink Settings Dialog Box
- Add AppLink Reference Dialog Box

ThinApp Diagnostic Tools Dialog Box

AdminStudio 2019 | ThinApp Assistant

On the Diagnostic Tools dialog box, which is opened by selecting Diagnostic Tools in the More Options list on the General Settings page, you can choose to include the Windows Command Prompt and Registry Editor diagnostic tools with your ThinApp application.

If you include diagnostic tools with your ThinApp application, you will be able to look at the registry or file system for the application while it is running in its virtual environment. For example, if you were running a ThinApp application and got an error message stating that the application cannot load a DLL, you could use these diagnostic tools to troubleshoot the problem.

Caution • If you choose to include these diagnostic tools, the versions of regedit.exe and cmd.exe that are part of the operating system on the build machine are added to the ThinApp application. However, these tools may not be compatible with other operating systems.

Figure 12-44: Diagnostic Tools Dialog Box
You can use these diagnostic tools to inspect your application’s virtual environment at runtime. You have the following options:

**Table 12-52 • Diagnostic Tools Dialog Box Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Registry Diagnostics</td>
<td>Select this option if you want to include regedit.exe with your ThinApp application so that you can browse the registry.</td>
</tr>
<tr>
<td>File System Diagnostics</td>
<td>Select this option if you want to be able to browse the ThinApp application’s virtual environment file system using a command prompt.</td>
</tr>
</tbody>
</table>

**Launching the Diagnostic Tools Within the Virtual Environment**

If you selected the **Registry Diagnostics** or **File System Diagnostics** options on the **Diagnostic Tools** dialog box, shortcuts to those tools are automatically added to the ThinApp application.

When the user runs this ThinApp application, two additional shortcuts will be available in the application’s shortcut folder: The names of these shortcuts will reflect the application name, such as:

```
[ProductName] Registry
[ProductName] File System
```

When the user launches one of these shortcuts, that diagnostic tool is launched inside the context of the application's virtual environment.

**See Also**

*Including Diagnostic Tools in an App-V Package*

**Folder Isolation Options Dialog Box**

**AdminStudio 2019 | ThinApp Assistant**

On the **Folder Isolation Options** dialog box, you can override the default isolation options for the selected folder.
## Creating ThinApp Applications

**Figure 12-45:** Folder Isolation Options Dialog Box

![Folder Isolation Options Dialog Box](image)

**Caution** • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects, ThinApp, and registry settings.

The **Folder Isolation Options** dialog box includes the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Visibility of System Elements</th>
<th>Modifications to Virtual Elements</th>
<th>Modifications to System Elements</th>
<th>New Elements</th>
<th>If System and Virtual Element at Same Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>As defined internally by the ThinApp Assistant</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Write Copy</td>
<td>Visible</td>
<td>Sandbox</td>
<td>Sandbox</td>
<td>Created in Sandbox</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Merged</td>
<td>Visible</td>
<td>Sandbox</td>
<td>System</td>
<td>Created in System</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Full</td>
<td>Not Visible</td>
<td>Sandbox</td>
<td>N/A (System elements cannot be modified)</td>
<td>Created in Sandbox</td>
<td>N/A (System elements cannot be read)</td>
</tr>
</tbody>
</table>
ThinApp Isolation Option Use Scenarios

The following table describes scenarios where you would use each isolation option:

Table 12-54 • Use Scenarios for ThinApp Isolation Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Use Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Write Copy</strong></td>
<td>You would use <strong>Write Copy</strong> isolation when:</td>
</tr>
<tr>
<td></td>
<td>• Application was not designed or tested for multi-user environments and expects it can modify files and keys without impacting other users.</td>
</tr>
<tr>
<td></td>
<td>• Application expects write permission to Global locations and was not designed for locked-down desktop environments found in corporate environments or Windows Vista.</td>
</tr>
<tr>
<td></td>
<td>With <strong>Write Copy</strong> isolation, ThinApp makes copies of registry keys and files written by the application and performs all of the modifications in a user-specific sandbox. With this type of isolation, the ThinApp applications believe that they have global write permissions, while they really only modify the sandbox directory.</td>
</tr>
<tr>
<td><strong>Merged</strong></td>
<td>You would use <strong>Merged</strong> isolation when the ThinApp application needs write access to user-specific storage areas, like the Desktop and My Documents.</td>
</tr>
<tr>
<td><strong>Full</strong></td>
<td>You would use <strong>Full</strong> isolation when a ThinApp application needs to run on a machine where earlier or later versions of the same application are either installed or were not uninstalled correctly.</td>
</tr>
</tbody>
</table>

For directories and registry keys that have **Full** isolation, the ThinApp application will not be aware of any host computer file that might exist, and it sees only virtual files and registry keys at fully isolated locations.

Registry Isolation Options Dialog Box

AdminStudio 2019 | ThinApp Assistant

On the **Registry Isolation Options** dialog box, you can override the default isolation options for the selected registry key.
Figure 12-46: Registry Isolation Options Dialog Box

**Caution** • Modify isolation options only if you have advanced knowledge of Microsoft operating system objects, ThinApp, and registry settings.

The **Registry Isolation Options** dialog box includes the following options:

**Table 12-55 • ThinApp Isolation Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Visibility of System Elements</th>
<th>Modifications to Virtual Elements</th>
<th>Modifications to System Elements</th>
<th>New Elements</th>
<th>If System and Virtual Element at Same Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>As defined internally by the ThinApp Assistant</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Write Copy</td>
<td>Visible</td>
<td>Sandbox</td>
<td>Sandbox</td>
<td>Created in Sandbox</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Merged</td>
<td>Visible</td>
<td>Sandbox</td>
<td>System</td>
<td>Created in System</td>
<td>Sees Virtual Element</td>
</tr>
<tr>
<td>Full</td>
<td>Not Visible</td>
<td>Sandbox</td>
<td>N/A</td>
<td>Created in Sandbox</td>
<td>N/A</td>
</tr>
</tbody>
</table>

(System elements cannot be modified) (System elements cannot be read)
ThinApp Isolation Option Use Scenarios

The following table describes scenarios where you would use each isolation option:

Table 12-56 • Use Scenarios for ThinApp Isolation Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Use Scenario</th>
</tr>
</thead>
</table>
| **Write Copy** | You would use **Write Copy** isolation when:  
  - Application was not designed or tested for multi-user environments and expects it can modify files and keys without impacting other users.  
  - Application expects write permission to Global locations and was not designed for locked-down desktop environments found in corporate environments or Windows Vista.  
  With **Write Copy** isolation, ThinApp makes copies of registry keys and files written by the application and performs all of the modifications in a user-specific sandbox. With this type of isolation, the ThinApp applications believe that they have global write permissions, while they really only modify the sandbox directory. |
| **Merged** | You would use **Merged** isolation when the ThinApp application needs write access to user-specific storage areas, like the Desktop and My Documents. |
| **Full**   | You would use **Full** isolation when a ThinApp application needs to run on a machine where earlier or later versions of the same application are either installed or were not uninstalled correctly.  
  For directories and registry keys that have **Full** isolation, the ThinApp application will not be aware of any host computer file that might exist, and it sees only virtual files and registry keys at fully isolated locations. |

Overview of the Citrix Assistant

AppLink Settings Dialog Box

AdminStudio 2019 | ThinApp Assistant

*Note* • The AppLink Settings feature requires ThinApp 4.x If you are using Thinstall 3.x, any AppLink settings that you define will be ignored.

The AppLink (Application Link) feature enables you to configure relationships between ThinApp applications that work together. You can set AppLink settings for the current ThinApp application on the AppLink Settings dialog box, which is opened by clicking the AppLink Settings option in the More Options menu of the ThinApp Assistant Build Options page.
Figure 12-47: AppLink Settings Dialog Box

You can use the AppLink feature to perform the following tasks:

- **Linking runtime components to applications**—You can link runtime components to the applications that use them. For example, you can link a package containing the Java runtime environment (JRE) or ODBC drivers to a package containing a browser application.

- **Linking add-ons and plug-ins to applications**—You can link add-ons and plug-ins to applications. For example, Microsoft Office add-ons can be linked to applications or Adobe Photoshop plug-ins can be linked to a package containing Photoshop.

- **Linking packaged applications to service packs**—You can link packaged applications to service packs. By using AppLink, you can upgrade or roll back your service packs by changing the service pack that you capture and link to its parent application.

The **AppLink Settings** dialog box has the following options:

**Table 12-57 • AppLink Settings Dialog Box**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AppLink References</td>
<td>List of ThinApp applications that are linked to the open ThinApp application. The following information is listed:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reference</strong>—List of linked ThinApp applications, including the application location and name.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Required</strong>—If <strong>Yes</strong> is listed in this column, the linked application must be available in order for the ThinApp application to run. If the linked application cannot be found, the ThinApp application will fail to run. See Required and Optional Linked Applications for more information.</td>
</tr>
<tr>
<td>Browse Button</td>
<td>Click the Browse button to open the <strong>Add AppLink Reference</strong> dialog box, where you can add a linked application to the <strong>AppLink Reference</strong> list. For more information, see Add AppLink Reference Dialog Box.</td>
</tr>
</tbody>
</table>
Creating Customized Virtual Applications

Creating ThinApp Applications

Required and Optional Linked Applications

When an application is linked to a ThinApp application, it can be designated to be either Required or Optional:

**Required Applications**

If a package is required, it has a mark in the *Required* column. If this package is missing from the virtual package, it will fail to run.

- If any specified package fails to import, an error message will be displayed and the parent executable file will exit.
- If a wildcard pattern is used to specify a package, no error message is displayed if no files match the wildcard pattern. Therefore, if a wildcard pattern is used to specify a package, the reference is always optional.
- To continue even if load errors occur, make the package references optional instead.

**Optional Applications**

If a package does not have a mark in the *Required* column, it is optional. An optional package operates the same as a required package except that if an import fails to load, the error is ignored and the main application will start executing.

Collisions and Order of Import

ThinApp uses a “last import wins” policy to determine what happens when two packages are imported that have the same files or registry keys.

For example, if PackageA.exe has `c:\myinfo.txt` in its virtual file system and PackageB.exe also has `c:\myinfo.txt` in its virtual file system, ThinApp will determine what happens based on which package is imported last.

- **Package order in the AppLink References list**—If PackageA.exe is listed before PackageB.exe on the AppLink References list, PackageB.exe’s copy of `c:\myinfo.txt` will be used. But if PackageB.exe is listed before PackageA.exe on the AppLink References list, PackageA.exe’s copy of `c:\myinfo.txt` will be used.

- **Wild cards**—When wild cards are used, alphabetical order is used to load packages, so if you enter Package*.exe in the AppLink References list, PackageB.exe will be loaded last (after PackageA.exe), so its copy of `c:\myinfo.txt` will be used.

Table 12-57 • AppLink Settings Dialog Box

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Up and Down Arrows</strong></td>
<td>ThinApp uses a “last import wins” policy to determine what happens when two packages are imported that have the same files or registry keys. Therefore, you can use the Up and Down arrows to order the list of linked applications. See Collisions and Order of Import for more information.</td>
</tr>
</tbody>
</table>

**Note** • Initially, the Required and Optional linked applications are listed on this dialog box together, and you can change the order of these applications using the Up and Down arrows. However, at runtime, the linked applications in the Required category are read first, before those in the Optional category, even though an Optional application might have been listed before a Required application in the AppLink References list. Also, each time the AppLink Settings dialog box is reopened, the Required linked applications will be grouped at the top of the list, before all Optional applications.
- **VB scripts**—If two or more packages include VB scripts, the order of execution for the VB Scripts will be alphabetical order by the name of the package. If two packages contain a VB script with the same name, the “last import wins” policy will be used to execute only the version of the VB script from the last imported package containing a script with that name.

**Caution** • Because VB Script name collisions could cause scripts from other packages not to be executed, it is important to use unique name for VB Script filenames.

**Security and Authorization**

The user running the ThinApp application must be a member of all PermittedGroups sections for all of the linked (imported) ThinApp applications. If this is not the case, an Access Denied message will be displayed and the main ThinApp application will fail to load.

The following are limitations of the AppLink feature:

- ThinApp supports importing up to 250 packages at a time, and each package may be any arbitrary size.
- Packages that have been updated via AppSync will not have updates visible to the parent executable.
- Sandbox changes from packages being imported will not be visible to the parent executable.

[Setting AppLink Options](#)

---

**Add AppLink Reference Dialog Box**

AdminStudio 2019 | ThinApp Assistant

**Note** • The AppLink Settings feature requires ThinApp 4.x if you are using Thinstall 3.x, any AppLink settings that you define will be ignored.

The AppLink (Application Link) feature enables you to configure relationships between ThinApp applications that work together. On the **Add AppLink Reference** dialog box, which is opened by clicking the Browse button on the **AppLink Settings** dialog box, you specify the name and location of a ThinApp application and indicate whether that application is Required or Optional.

**Figure 12-48: Add AppLink Reference Dialog Box**

In the **ThinApp Reference** box, enter the relative (runtime) path to the existing ThinApp application that you want to link to. For more information on how to specify a ThinApp Reference, see the following:
Chapter 12  Creating Customized Virtual Applications
Creating ThinApp Applications

- Enter a Relative Path
- Path Name Format
- Which ThinApp File Should Be Specified in an AppLink Reference?
- Required vs. Optional
- Examples of AppLink References

**Enter a Relative Path**

On the **Add AppLink Reference** dialog box, if you click Browse and browse for a ThinApp application, the absolute path to that application is entered, such as `C:\Program Files\AppName\filename.exe`. In that case, the main ThinApp application needs that linked application to be found at the specified absolute path location at runtime, which is unlikely. Therefore, it is recommended that you enter a relative path name.

**Path Name Format**

AppLink supports both URL and UNC path names.

**Which ThinApp File Should Be Specified in an AppLink Reference?**

If a ThinApp application has only one shortcut, it consists of a single executable. Therefore, you would obviously specify that executable file when creating an AppLink Reference.

However, when a ThinApp application has more than one shortcut, the ThinApp file that you specify in an AppLink Reference depends upon what tool you used to build the ThinApp application:

**Table 12-58 • File to Specify in an AppLink Reference**

<table>
<thead>
<tr>
<th>Tool Used to Build ThinApp Application</th>
<th># of Shortcuts</th>
<th>ThinApp Application File to Specify</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdminStudio or ThinApp</td>
<td>Only one</td>
<td>Specify the executable file (.EXE).</td>
</tr>
<tr>
<td>AdminStudio</td>
<td>More than one</td>
<td>When built with AdminStudio, a ThinApp application that has more than one shortcut consists of two or more executable files and a Package.DAT file (as described in Components of an App-V Package). In this situation, specify the Package.DAT file.</td>
</tr>
<tr>
<td>ThinApp</td>
<td>More than one</td>
<td>When built with ThinApp, a ThinApp application that has more than one shortcut consists of multiple executable files, with one primary executable. In this situation, specify the primary executable file (.EXE).</td>
</tr>
</tbody>
</table>

**Required vs. Optional**

If you want this package to be required, select the **Required** option. If a required package is missing from the virtual package, it will fail to run. Note the following about required packages:

- If any specified package fails to import, an error message will be displayed and the parent executable file will exit.
• If a wildcard pattern is used to specify a package, no error message is displayed if no files match the wildcard pattern. Therefore, if a wildcard pattern is used to specify a package, the reference is always optional.

• To continue even if load errors occur, make the package references optional instead.

**Examples of AppLink References**

The following are examples of how packages can be added to the AppLink References list:

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plugin.exe</td>
<td>This will import a single package located in the same directory as the parent executable.</td>
</tr>
<tr>
<td>plugins\Plugin.exe</td>
<td>This will import a single package located in the plugins subdirectory of the parent executable.</td>
</tr>
<tr>
<td>plugins*.exe</td>
<td>This will import all executables located in the plugins directory.</td>
</tr>
<tr>
<td><img src="important.png" alt="" /></td>
<td>If any executable fails to import because it is not a proper ThinApp package or because of a security issue, the parent executable will fail to load.</td>
</tr>
<tr>
<td>n:\plugins*.exe</td>
<td>This will import all EXEs located at the absolute path n:\plugins.</td>
</tr>
<tr>
<td>%PLUGINS%*.exe</td>
<td>This expands the environment variable, PLUGINS, and imports all executables found at this location.</td>
</tr>
<tr>
<td>plugin1.exe;plugin2.exe;plugins*.exe</td>
<td>This loads two specified plugins and a list of executables found in the plugins subdirectory.</td>
</tr>
</tbody>
</table>

Setting AppLink Options

**AppSync Settings Dialog Box**

AdminStudio 2019 | ThinApp Assistant

**Note** • The AppSync Settings feature requires ThinApp 4.x If you are using Thinstall 3.x, any AppSync settings that you define will be ignored.

AppSync (Application Sync) enables you to automatically keep deployed virtual applications up to date. When an application starts up, AppSync can query a Web server to see if an updated version of the package is available. If an update is available, the differences between the existing package and the new package will be downloaded and used to construct an updated version of the package. The updated package will be used for future deployments.

You can use the AppSync feature to perform the following tasks:
• **Distribute runtime components separately**—You can use AppSync to distribute runtime components separately from the applications that use them. For example, the Java Runtime Environment (JRE) or ODBC drivers.

• **Apply layered service packs to applications**—You can use AppSync to apply layered service packs to your applications. Application Sync enables you to distribute service packs and roll back to previous versions, if necessary.

On the **AppSync Settings** dialog box, which is opened by clicking **AppSync Settings** on the **More Options** menu of the **Build Options** page, you can configure AppSync settings for your ThinApp application.

On the **Expiration** tab, you can specify that the ThinApp application is required to check for updates at a defined frequency. If the ThinApp application fails to successfully check for updates within that defined frequency, it will fail to run. Note that the update does not expire, the ThinApp application expires, and cannot be used until it is updated successfully.

The **AppSync Settings** dialog box includes two tabs:

• **General Tab**

• **Expiration Tab**

**General Tab**

On the **General** tab, you specify the location of the Web server that hosts application updates.

![General Tab of the AppSync Settings Dialog Box](image)

**Figure 12-49:** General Tab of the AppSync Settings Dialog Box
The following options are included:

**Table 12-60 • General Tab of the AppSync Settings Dialog Box**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Url</strong></td>
<td>URL of the Web server where updates are stored. Application Sync works over both the HTTP (unsecure) and HTTPS (secure) protocol. Part of HTTPS is that the identity of the Web server is checked. You can include a user name and password in the URL that will be used for basic authentication. The standard Windows/Internet Explorer proxy setting is respected. For example: <a href="https://example.com/some/path/PackageName.exe">https://example.com/some/path/PackageName.exe</a></td>
</tr>
<tr>
<td><strong>Message</strong></td>
<td>When an updated package is first launched, an information message can be shown. For example: Your application has been updated.</td>
</tr>
<tr>
<td><strong>Frequency</strong></td>
<td>By default, a package will connect to the Web server once per day to see if an updated version is available. You can set the frequency by modifying this setting. For example, to set the Frequency to 2 days, enter 2d. For 2 weeks, enter 2w, etc.</td>
</tr>
<tr>
<td><strong>Clear Sandbox</strong></td>
<td>Gives you the option to clear the sandbox after an update. By default, the sandbox is not cleared. Select this option to clear the sandbox.</td>
</tr>
</tbody>
</table>

**Expiration Tab**

On the **Expiration** tab, you can specify that a ThinApp application is required to check for updates at a defined frequency. If the ThinApp application fails to successfully check for updates within that defined frequency, it will fail to run.

**Figure 12-50:** Expiration Tab of the AppSync Settings Dialog Box
The following options are included:

**Table 12-61 • Expiration Tab of the AppSync Settings Dialog Box**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Application Expiration</td>
<td>Select this option to require that an application has to check for updates at a specified frequency.</td>
</tr>
</tbody>
</table>
| Expire Period        | Sets the update frequency in minutes (m), hours (h), or days (d). If the Web server cannot be reached, the package will continue to work until the Expire Period is reached. This default setting is 30 days but you can change that setting by modifying this setting. For example:  
  - To set the period to 30 days, enter **30d**  
  - If you do not want the package to expire, clear the Use Application Expiration check box. |
| Warning Period       | Sets the start of the warning period before a package expires. For example, to set the period at 5 days, enter **5d**.                                                                                   |
| Warning Frequency    | Sets the frequency of warnings before the package expires. With the default of one day, the warning message will be displayed once per day only. To configure the warning to pop up on every application launch, enter **0**. To configure it to pop up every 4 days, enter **4d**.  
  
  After the warning period has started, the Web server will be checked on every launch of an application, overriding any previous setting.  
  
  As long as a package has not expired, this parameter checks for new versions and downloads will occur in the background. The user can continue to use the old version. If the application is terminated by the user before the download is complete, the download will resume when a virtual application is launched again. After the download completes, the new version will be activated on the next launch.  
  
  When the package has expired, the version check and download will happen in the foreground. A progress bar will be shown during the download phase. |
| Expiration Message   | After the expiration limit has been reached and a virtual application is started, it will try to connect to the Web server and check for a new version. If the connection fails, a message box will be shown and execution will be terminated. The default message is shown in the example below.  
  
  For example:  
  
  This application has been unable to contact its update server for **Expiration Period** days, so it is unavailable for use. Check your network connection and try again. |
Chapter 12  Creating Customized Virtual Applications

Creating ThinApp Applications

Note • If you use AppSync, VMware recommends that you disable automatic application updates that are configured in your virtual application. Conflicts might occur between the linked packages and the software that is automatically updated. If an automatic update feature updates an application, it stores the updates in the sandbox. If AppSync then updates the application to a different version, the updates stored in the sandbox take precedence over the files contained in the version that AppSync created. The order of precedence for the update files are those in the sandbox, then the virtual operating system, and then the physical machine.

Setting AppSync Options

Building ThinApp Applications Using the Command Line

AdminStudio 2019 | ThinApp Assistant

When you configure a ThinApp application in an InstallShield project and then build that project (using either the user interface or the command line), both the Windows Installer package and the ThinApp application are built. When you use the standard InstallShield command line build, you do not need to add any additional command line parameters. All of the ThinApp application settings are saved within the InstallShield project.

ThinApp Application Conversion Error and Warning Messages

AdminStudio 2019 | ThinApp Assistant

For troubleshooting information about resolving errors and warnings that you may encounter when you are building a virtual application, see Virtualization Conversion Errors and Warnings.

Application Features Requiring Pre- or Post-Conversion Actions

AdminStudio 2019 | ThinApp Assistant

Some application features are ignored when creating a ThinApp application. Therefore, some additional pre- or post-conversion actions must be taken in order for the ThinApp application to be created properly.

One action you could take to try to include ignored features in an ThinApp application is to first repack the application using the Repackaging Wizard, and then convert the repackaged application to a ThinApp application.

For a list of ignored features, see Application Features Requiring Pre- or Post-Conversion Actions.
ThinApp Not Found

ThinApp Application Configuration File: package.ini

Note • For the latest information on the ThinApp application configuration file, package.ini, consult your ThinApp documentation.
## [BuildOptions]

AdminStudio 2019 | ThinApp Assistant

The [BuildOptions] section of the package.ini file specifies Global options which will be inherited by each child executable file. The following options are included:

### Table 12-62 • [BuildOptions] Section of package.ini

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SandboxName</strong></td>
<td>When a ThinApp application is built, a Sandbox cache is created in the following location:</td>
</tr>
<tr>
<td></td>
<td>c:\Documents &amp; Settings\USER_NAME\Application Data\ThinApp\SandboxName</td>
</tr>
<tr>
<td></td>
<td>The SandboxName entry in the package.ini file is used to name the directory where sandbox files are stored at runtime.</td>
</tr>
<tr>
<td></td>
<td>SandboxName=MyApplicationV3</td>
</tr>
<tr>
<td></td>
<td>By default, AdminStudio names the Sandbox by assigning it a unique GUID. However, if you want to override this default Sandbox name, you may</td>
</tr>
<tr>
<td></td>
<td>(optionally) enter a new name in the package.ini file using the SandboxName option.</td>
</tr>
<tr>
<td></td>
<td>If no Sandbox Name is entered, a unique GUID is used, such as:</td>
</tr>
<tr>
<td></td>
<td>SandboxName={2BDBE10A-9E53-4B5E-811D-DF8019D0B13C}</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This option corresponds to the Sandbox Name field on the General Information page.</td>
</tr>
<tr>
<td><strong>InventoryName</strong></td>
<td>Used by desktop management systems to identify packages for usage reporting purposes. If you do not use a desktop management system or license-controlled system, this value has no effect</td>
</tr>
<tr>
<td></td>
<td>InventoryName=MainApp v1.0</td>
</tr>
<tr>
<td><strong>SandboxNetworkDrives</strong></td>
<td>Enable this option if you want changes to data on Network-mapped drives to go into the sandbox. By default, the ThinApp application can read and write to network mapped drives with no changes. The value for SandboxNetworkDrives is set to either 0 (off) or 1 (on).</td>
</tr>
<tr>
<td></td>
<td>SandboxNetworkDrives=0</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This option corresponds to the Mapped Network Drive Changes go to Sandbox option on the General Settings page.</td>
</tr>
</tbody>
</table>
Table 12-62 • [BuildOptions] Section of package.ini (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SandboxRemovableDisk</td>
<td>Enable this option if you want changes to data on Removable disk (floppy/flash) to go into the sandbox. By default the application can read and write to removable disk with no changes. The value for SandboxRemovableDisk can be set to either 0 (off) or 1 (on).</td>
</tr>
<tr>
<td></td>
<td>SandboxRemovableDisk=0</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This option corresponds to the Removable Disk Changes go to Sandbox option on the General Settings page.</td>
</tr>
<tr>
<td>RemoveSandboxOnExit</td>
<td>Enable this option if you want to delete the sandbox when the ThinApp application exits. This resets the application to its original captured state. If the application spawns child processes, the clean up will be postponed until all have quit. The value for RemoveSandboxOnExit can be set to either 0 (off) or 1 (on).</td>
</tr>
<tr>
<td></td>
<td>RemoveSandboxOnExit=0</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> • This option corresponds to the Reset Sandbox on Exit option on the General Settings page.</td>
</tr>
<tr>
<td>ExternalCOMObjects</td>
<td>This option allows you to specify that you want specific COM objects to be executed on the system instead of in the virtual environment. This option only applies to out-of-process COM objects (LocalServer32) and Services-based COM objects.</td>
</tr>
<tr>
<td></td>
<td>To specify multiple objects, put a semicolon after each entry. Objects should always be specified in CLSID format.</td>
</tr>
<tr>
<td></td>
<td>The following class ID specifies the class ID for Microsoft Word:</td>
</tr>
<tr>
<td></td>
<td>ExternalCOMObjects={000209FF-0000-0000-C000-000000000046};{000209FF-0000-0000-C000-000000000047}</td>
</tr>
<tr>
<td></td>
<td><strong>Caution</strong> • This option is for advanced users.</td>
</tr>
</tbody>
</table>
VirtualizeExternalOutOfProcessCOM

Enable this option if you want all out-of-process COM objects to be loaded outside of the virtual environment. By doing this, the application may indirectly modify the machine—for example, the MSI installer service COM object could be modified.

VirtualizeExternalOutOfProcessCOM=0

The value for this option can be set to either:

- 0—Inside virtual environment
- 1—Outside the virtual environment

The default is to create all out-of-process COM objects inside the virtual environment.

PermittedGroups

Using this option, you can specify the Active Directory groups which are allowed to use this ThinApp application.

PermittedGroups=Group1;Group2;Group3

Note • This option corresponds to the Allow application execution to the following user groups option on the General Settings page.

AccessDeniedMsg

Use this option to customize the message the user sees if they do not have permission to execute a ThinApp application.

AccessDeniedMsg=You do not have access to execute this application, please contact your Administrator

Note • This option corresponds to the Message shown when users not belonging to above groups run the ThinApp application field on the General Settings page.

Executables located in the virtual file system are always executed within the virtual environment. Executables located in the physical file system can be executed inside or outside the virtual environment.

The default is determined by the ChildProcessEnvironmentDefault option, which can be set to Virtual or External. If this option is not present, the default is the Virtual environment.

It is possible to override the default for specific applications by specifying a list of applications, separated by semicolons, using the ChildProcessEnvironmentExceptions option. If a complete path is specified, the full name of the executable is used for the comparison; otherwise, only the file name is used.

For example:

ChildProcessEnvironmentDefault=Virtual
ChildProcessEnvironmentExceptions=exec.exe;c:\path\file.exe

In this example, c:\exec.exe, c:\Windows\exec.exe and c:\path\file.exe would be executed externally.

AutoShutdownServices

Use this option to specify if virtualized services keep on running when the last non-service process exits. Permitted values are:

- 0—Keep on running.
- 1—Stop virtualized services (Default).

AutoShutdownServices=1
Under some conditions, Norton AntiVirus will try to perform a complete scan of an executable. This scan can have a big impact on launch times for large executable files located on network shares. Norton AntiVirus decides to perform a complete scan under these conditions:

- **If the executable is launched from a network share or removable disk.** It skips the scan when the executable is located on the hard drive).

- **When the executable makes its first network connection.** It does not scan the executable if the executable does not make any network connections.

Because a large number of desktops have Norton AntiVirus installed, ThinApp automatically compensates for this by allowing applications to launch from a network share without incurring the lengthy scan times. It does so by creating a small stub executable in the user’s sandbox which is then relaunched. Because the small executable can be scanned quickly, it will load the remainder of the application data from the original source location.

You can disable ThinApp default behavior by adding the `NetRelaunch=1` option to disable full file scans.

<table>
<thead>
<tr>

| Icon              | By default the icon is used from the executable identified in the Source option. You can change this to specify one of the following:  
|                   | Icon=SomeOtherEXE.exe                                                                        |
|                   | Icon=NULL                                                                                    |
|                   | Icon=SomeOtherIco.ico                                                                        |

RetainAllIcons

By default, each application retains the main Group Icon from its Source executable and the individual icon resource pointed to by the Group Icon. Tlink will strip out extra icons that cannot be used directly by the system shell. However, you can force these extra icons to be included in the ThinApp executable by using the RetainAllIcons=1 option. For example:

```
[myapp.exe]
Source=%ProgramFilesDir%\myapp\app.exe
RetainAllIcons=1
```

Instead of using the Source option to identify your application icon, you can also use:

1. **The value NULL.** In this case, the application will not have an icon and Windows will use the default application icon.

   ```
   [myapp.exe]
   Source=%ProgramFilesDir%\myapp\app.exe
   Icon=NULL
   ```

2. **The path to another .exe file.** In this case, Tlink will load the icons from a different .exe file. If a full path is not specified, the path is relative to the project directory.

   ```
   [myapp.exe]
   Source=%ProgramFilesDir%\myapp\app.exe
   Icon=%ProgramFilesDir%\myapp\app2.exe
   ```

   Executable files can contain multiple icon sets. You can optionally specify which set to use by appending ",1" or ",2" to the end of the Icon path name like this:

   ```
   [myapp.exe]
   Source=%ProgramFilesDir%\myapp\app.exe
   Icon=%ProgramFilesDir%\myapp\app2.exe,1
   ```

3. **The path to an .ico icon file.** In this case, Tlink will load the icons from the specified .ico file. If a full path is not specified, the path is relative to the project directory.

   ```
   [myapp.exe]
   Source=%ProgramFilesDir%\myapp\app.exe
   Icon=%ProgramFilesDir%\myapp\myicon.ico
   ```

Customizing and Authoring Installations Using InstallShield

InstallShield Editor provides the most comprehensive and flexible setup-creation technology available for the Windows Installer. With the latest InstallShield installation development environment (Interface) you can create setup packages that utilize Windows Installer technology, while harnessing the flexibility provided by InstallScript, InstallShield’s development language.

Administrators can also take advantage of InstallShield Editor to customize repackaged legacy setups, further enhancing them prior to deploying them in production environments. For AdminStudio Professional and Enterprise Editions, InstallShield Editor contains integrated Application Catalog functionality.

InstallShield Editor’s documentation is divided into the following main areas:

<table>
<thead>
<tr>
<th>Table 13-1 • InstallShield Editor Documentation</th>
</tr>
</thead>
<tbody>
<tr>

AdminStudio-Specific Functionality in InstallShield Editor

AdminStudio 2019 | InstallShield Editor

Edition • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

When running InstallShield Editor from AdminStudio, some AdminStudio-specific functionality is enabled:

Table 13-2 • AdminStudio Functionality in InstallShield Editor

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstallShield Editor Integration with Application Catalog and the Software Repository</td>
<td>If you have the AdminStudio Enterprise Edition, which includes the Software Repository feature, you can add a package to the software repository via the InstallShield Editor Build process.</td>
</tr>
</tbody>
</table>
| Repackager Integration | You can launch Repackager from the InstallShield Editor interface for conversion of the following:  
  - Novell ZENworks projects (.axt/.aot)  
  - Microsoft SMS Installer projects (.ipf)  
  - WinINSTALL exported text files (.txt)  
  - Wise Installation files (.wse)  
  - Legacy Repackager projects (.inc)  
  When you attempt to open any of these file types in InstallShield Editor, you can launch Repackager to perform the conversion. |

Note • AdminStudio Role permissions apply to Application Catalog functionality in InstallShield Editor. If you are not assigned to a Role with sufficient permissions, you may not be able to access some of these features.
InstallShield Editor Integration with Application Catalog and the Software Repository

AdminStudio 2019 | InstallShield Editor

Edition • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

The following topics describe InstallShield’s integration with Application Catalog:

- InstallShield Integration with Application Catalog Software Repository
- Quickly Opening Package in InstallShield Direct Edit Mode
- Quickly Creating and Opening a Transform File in InstallShield Direct MST Mode

InstallShield Integration with Application Catalog Software Repository

AdminStudio 2019 | InstallShield Editor

Edition • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

Edition • The Software Repository feature is available in AdminStudio Enterprise Edition.

When you have a Basic MSI project open in InstallShield Editor, AdminStudio-specific settings are listed in the Publishing area on the Events tab of the Media > Releases view in the Installation Designer.
You can use these settings to specify information such as whether you want the Windows Installer package that you are building to be published to the software repository.

**Table 13-3 • Publishing Settings on the Events Tab—for InstallShield with AdminStudio**

<table>
<thead>
<tr>
<th>Property</th>
<th>Project Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Publish to AdminStudio Repository</td>
<td>Basic MSI</td>
<td>Specify whether you want the Windows Installer package that you are building to be published to the software repository.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you use the software repository to manage a Windows Installer package, the <code>.msi</code> file and all of its other associated files and subfolders are stored in a subfolder of the software repository location that is identified for the package’s Application Catalog.</td>
</tr>
<tr>
<td>Group</td>
<td>Basic MSI</td>
<td>If you select Yes for the <strong>Publish to AdminStudio Repository</strong> setting and you want to associate the Windows Installer package with one or more groups in the Application Catalog, click the ellipsis button (…) in this setting. The <strong>Select Application Catalog Groups</strong> dialog box opens. Select the check box for each group that you want to contain the Windows Installer package.</td>
</tr>
</tbody>
</table>
Adding a Package to the Software Repository via the InstallShield Editor Build Process

To add a package to the Software Repository via the InstallShield Editor Build process, perform the following steps:

1. In AdminStudio, connect to an Application Catalog that has the Software Repository enabled.
2. Launch InstallShield Editor.
3. Open an InstallShield project (.ism).
4. In the Installation Designer, open the Events tab of the Releases View.
5. Set the Publish to AdminStudio Repository property to Yes.
6. Select the Group that you want the imported package to belong to.
7. Select one of the following for Update Option:
   - New Package Version
   - Overwrite Existing Version
   - New Package History Version
   - Ignore if Exists
8. Build the setup.

Upon completion of the build, the MSI package is published to the Software Repository. The progress messages are displayed in the Output window.

Note • If the setup is compressed, an administrative image must be created before the package can be published to the Software Repository.
Quickly Opening Package in InstallShield Direct Edit Mode

AdminStudio 2019 | InstallShield Editor

Edition • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

To quickly open a Windows Installer package in InstallShield Direct Edit Mode, open the Application Catalog Home tab, select the package in the Application Catalog tree and select **Edit with InstallShield** from the shortcut menu.

![Figure 13-2: Opening a Package in InstallShield Direct Edit Mode from Application Catalog](image)

After you have finished editing this package in InstallShield and have saved it, you can then reimport the Windows Installer package along into the Application Catalog by right-clicking on the Windows Installer package in the Application Catalog tree and selecting **Reimport Package** from the shortcut menu.

![Figure 14: Reimport Package Command on Shortcut Menu](image)

Quickly Creating and Opening a Transform File in InstallShield Direct MST Mode

AdminStudio 2019 | InstallShield Editor

Edition • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

You can quickly create a new transform project for a Windows Installer package by right-clicking on the package in the Application Catalog tree and then selecting **Create Transform with InstallShield** from the shortcut menu.
Figure 15: Create Transform with InstallShield

A new transform project (named PackageName_ISTransform.mst) for the selected package opens in InstallShield in Direct MST mode.

Figure 16: Transform File Open in InstallShield Direct MST Mode

After you have finished customizing this transform file in InstallShield and have saved it, you can then reimport the Windows Installer package along with its newly created transform file into the Application Catalog by right-clicking on the Windows Installer package in the Application Catalog tree and selecting Reimport Package from the shortcut menu. This lets Application Catalog know that you are done editing the transform file.
Microsoft App-V, VMware ThinApp, and Citrix XenApp Virtualization Support

Both AdminStudio and InstallShield Editor provide support for the conversion of Windows Installer packages to virtual packages:

- **Automated Application Converter**—You can use the Automated Application Converter to convert a Windows Installer or legacy package (or group of packages) into Microsoft App-V, VMware ThinApp, Citrix XenApp. Automated Application Converter can examine a group of selected setups and perform automated virtualization of those that can be cleanly virtualized. For those setups that cannot be cleanly virtualized (due to custom actions, etc.), Automated Application Converter can perform automated repackaging of those setups and then perform automated virtualization of those repackaged MSIs.

- **Repackager Interface**—By selecting an option on the Repackaged Output view, you can simultaneously build an InstallShield Editor project, a Windows Installer package, a Microsoft App-V application, a ThinApp application, and a Citrix profile from a Repackager project.

- **Microsoft App-V Assistant**—Using the Microsoft App-V Assistant, you can convert a Windows Installer package or an InstallShield project to a customized App-V application. You can modify a Microsoft App-V application’s operating system requirements, files, folders, shortcuts, registry settings, isolation options, and build options.

- **ThinApp Assistant**—Using the VMware ThinApp Assistant, you can convert a Windows Installer package or an InstallShield project to a customized ThinApp application. You can configure a ThinApp application’s files, folders, registry settings, isolation options, and build options.

- **Citrix Assistant**—Using the Citrix Assistant, you can convert a Windows Installer package or an InstallShield project to a customized Citrix XenApp profile. You can modify a Citrix XenApp profile’s operating system and language requirements, files, folders, shortcuts, registry settings, script execution, isolation options, and build options.

For more information on the capabilities of these features, see *Getting Started With Application Virtualization*. 
Differences Between InstallShield Editor and InstallShield Professional and Premier Editions

AdminStudio 2019 | InstallShield Editor

**Edition** • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

The InstallShield Editor that is included with AdminStudio 2019 is based upon InstallShield Professional and Premier Editions, but it has a slightly different feature set. Those differences are explained here.

**Default Project Types**

In InstallShield Editor, all non-Windows Installer-based project types are disabled by default. You can enable these additional project types, such as InstallScript, on the InstallShield Editor Options dialog box, which is opened by clicking Options on the Tools menu.

**Multilingual Runtime Language Support**

InstallShield Editor includes InstallShield Premier Edition’s multilingual runtime language support, which enables you to create a single installation that displays end-user text in multiple languages. If an installation will contain more than one language, you can specify whether to prompt the end user to select the run-time language, or to automatically display the language of the target system’s operating system.

**Using a Network Repository to Share Project Elements**

A repository is a collection of common elements that can be shared and reused in different installation projects, enabling you to ensure consistency. InstallShield Editor includes not only InstallShield Professional Edition’s local repository support, but also InstallShield Premier Edition’s network repository support, which fosters collaboration among installation authors.

---

InstallShield Editor Help Library

AdminStudio 2019 | InstallShield Editor

**Edition** • InstallShield Professional is included with AdminStudio Standard and Professional Editions. InstallShield Premier is included with AdminStudio Enterprise Edition.

The InstallShield Editor Help Library gives you unified access to InstallShield Editor Help. This library’s help topics contain information that assist you in finding answers with InstallShield Editor.

Open the InstallShield Editor Help Library to see a listing of the Help Library’s contents.

Open the InstallShield Editor Help Library to see a listing of the Help Library’s contents.
**Note** • You can also download the InstallShield documentation PDFs from the InstallShield Documentation Center.
AdminStudio 2019 | Tuner

Using Tuner, you can add to, modify, or remove information from a Windows Installer package. This involves creating a transform file, where all the modifications are stored. When you install the package and transform together, your modifications are reflected in the installation.

Tuner allows you to configure the initial state of features, add or remove files from an installation, edit registry entries, configure setup properties, set Add/Remove Programs options, and configure servers for application resiliency. You can also validate Windows Installer packages and transform files to ensure they conform to Microsoft guidelines.

Tuner user documentation is presented in the following sections:

**Table 14-1 • Tuner User Documentation**

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>

</tbody>
</table>
When to Use Tuner vs. InstallShield Editor

Most system administrators use InstallShield Editor to import repackaged setups and convert them into Windows Installer packages. InstallShield Editor is also ideal for making changes to the package that you want reflected in all deployments of the package. However, it is recommended that you use Tuner to create transforms for changes that you only want to affect a particular deployment, rather than every installation.

Working with Transforms

The Microsoft-designated term transform refers to a specific file type used to customize a Windows Installer-based installation. A transform contains all modification information, such as whether features are installed, how they are installed, which files, shortcuts, and registry entries are included, and Windows 2000 and XP Add/Remove Programs information. Transform files use an .mst extension.

For example, you may need to customize an installation for different departments in your company. Typical business productivity suites come with a spreadsheet program, a word processor, and a presentation tool. Your accounting department may only need the spreadsheet and the presentation programs. On the other hand, the writing department may need only the word processor and the spreadsheet. A third department may need the entire suite of applications. Instead of manually setting up every person in the company, you can take the original setup of the entire suite, and create a customization project in the form of a transform to meet the needs of each department. A transform would need to be created for every configuration that you plan to use.

### Table 14-1 • Tuner User Documentation (cont.)

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring Additional Server Locations</td>
<td>Explains how to configure additional server locations.</td>
</tr>
<tr>
<td>Changing Add/Remove Program Settings</td>
<td>Explains how to configure the Windows setup to give the user the option of removing, repairing, or changing the installation with the click of a button.</td>
</tr>
<tr>
<td>Customizing Setup Properties</td>
<td>Explains how to edit property values in the properties table (the underlying structure of Windows Installer packages). You can also add your own custom properties.</td>
</tr>
<tr>
<td>Preparing Packages for Distribution</td>
<td>Explains how to postvalidate your transform and base Windows Installer package, and how to package the transform and base package for distribution.</td>
</tr>
<tr>
<td>Directly Editing Packages</td>
<td>Explains how to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform.</td>
</tr>
<tr>
<td>Documenting Response Transform Creation Using the Microsoft Step Recorder Tool</td>
<td>Explains how to use the Microsoft Steps Recorder documentation tool to record the steps taken during transform creation.</td>
</tr>
<tr>
<td>Tuner Reference</td>
<td>Information on Tuner Views and dialog boxes.</td>
</tr>
</tbody>
</table>
Once you have created a transform, you can apply it at runtime, depending on whose machine the application is being installed on. For example, in the accounting department, the transform limits the installation to include only the spreadsheet and presentation programs.

In some cases, it may be necessary to have multiple transform files for an installation. For example, a vendor may use a transform file for language-specific information. When you want to customize that MSI file, you need to include the preexisting transform so your modifications affect the entire existing package.

## Creating New Transform Files

**Task** To create a new transform file:

1. Launch Tuner from the AdminStudio interface. The Tuner Start Page opens.

2. Click Create a new transform on the left side of the view or select New from the File menu. The right side of the view changes to display the fields necessary to create a new transform.

3. In the Select an MSI File field of the Base Windows Installer Package area, enter the name and location of the Windows Installer package that you are customizing, or click Browse to locate it.

4. If there are transforms already associated with the Windows Installer package, (for example, previous customizations or transforms containing language-specific information), go to the Provide a list of additional transforms to be applied area and click the New button:

   A new entry appears in the list.

   ![Provide a list of additional transforms to be applied](image)

   When an entry appears in the list, click the Browse button (...) to the right of it and locate the transform. If multiple transforms are associated with this package, use the Move Up and Move Down buttons to specify the order in which the transforms are applied.

   **Caution** • When using multiple transforms, keep in mind that the order in which they are applied is critical. For example, if you create a transform for a Windows Installer package that creates a new value for a property, and then create a second transform that changes the value created in the first transform, everything works correctly. However, if you apply the second transform first, that transform is attempting to modify the property’s value, instead of creating it. That will result in an error.

   One simple example of where this may be a problem is with the default company name. If the value is not set by default, and you set it in using the first transform, a new value for the property is created. If you create a second transform that
modifies the combined original package and first transform, and the second transform changes the default company name, it is only changing the property. However, if you try to apply the second transform without the first one, Windows Installer interprets this as trying to change a null value to another value, which will result in an error.

5. By default, the transform will be created in the same directory as the Windows Installer package, and named the same as the base package with an .mst extension. However, if you want to change the name and/or location of the transform, you can also do so in the Windows Installer Transforms area. Click Browse to open the Save Customization File dialog box. Navigate to the directory in which you want to store the transform file you are creating. Provide the name of the transform with an .mst extension (for example, MyTransform.mst) and click Save. The dialog box closes and the path and file name appear in the edit field.

6. If you want to create a Response Transform, check the appropriate box. If you are using a response transform, you can specify additional command-line properties (in property name/value pairs separated by semicolons) to pass to the response transform. These must be PUBLIC properties, and only control how the dialogs are displayed during creation of the response transform. They are not persisted outside of the UI sequence during creation. For example, you can pass the property/value pair ARPHELPLEPHONE=1-111-111-1111 to set the value of the Help Telephone field of Add/Remove Programs. See Using Response Transforms for more information.

You might pass a property/value pair during response transform creation to display all dialogs during an installation that may not be displayed based on your system configuration (for example, to show Windows 9x-only dialogs on a Windows NT platform). You can then make appropriate responses and have them included in your transform.

7. If you want to record the response transform creation steps in a document, select the Run Microsoft Step Recorder to document response transform creation steps to that they can be reviewed later. For more information, see Documenting Response Transform Creation Using the Microsoft Step Recorder Tool.

8. Ensure all the information entered is correct, and click Create.

- If you are creating a Standard Transform, the transform file is opened in the Tuner interface, displaying the Package Validation View.

- If you are creating a Response Transform, a simulated installation of the selected application begins. Step through the installation, making changes as necessary. When you reach the end of the installation sequence and click Install, the installation will exit and the Tuner interface will open your transform, displaying the Package Validation View. Your transform contains all of the changes you made during the simulated installation.

**Note** • You can access information about the original MSI file and associated transforms by selecting Properties from the File menu.

**Opening Existing Transforms**

On the Tuner Start Page, when you click on Open an existing transform file, the pane on the right of the interface changes. You can then specify the name and location of the base Windows Installer package, any associated transforms, and the name and location of the transform file.
Opening Recently Accessed Transforms

AdminStudio 2019 | Tuner

On the Tuner Start Page, when you click on Open a recent transform file, the pane to the right changes to a list containing your most recently accessed transforms.

From this View, you can perform the following tasks:

- To open a transform file, select a transform file and click Open.
- To view information on the transform file, select a transform file and click Properties. The Properties dialog box opens, listing details about the base MSI package and associated transforms.
- To specify the view that will appear when Tuner is started, select one of the following options:
  - Reload the last project saved when restarting Tuner
  - Make this my default Tuner Start Page Screen
  - Make Welcome my default Tuner Start Page Screen

Creating Generic Transforms

AdminStudio 2019 | Tuner

Most transforms are tied to a specific product code, meaning they can only be applied to a specific version of a product. Generic transforms, however, do not have that limitation. They can be created to apply to multiple versions of a Windows Installer package (for example, Office XP and Office 2000), or to any Windows Installer package.

<table>
<thead>
<tr>
<th>Task</th>
<th>To create a generic transform:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create a transform in Tuner as you would do normally.</td>
</tr>
<tr>
<td>2.</td>
<td>With the transform project open, select Transform Summary Information from the Project menu to access the <strong>Transform Summary</strong> dialog box.</td>
</tr>
<tr>
<td>3.</td>
<td>When the <strong>Transform Summary</strong> dialog box appears, change the validation options to reflect how you want the transform applied. If you want to create a completely generic transform, deselect all validation options.</td>
</tr>
</tbody>
</table>

Tip • One use for generic transforms is to enforce standard Add/Remove Programs information on every package installed in your environment. The same transform can be used to set all relevant properties.
Using Response Transforms

AdminStudio 2019 | Tuner

There are two ways you can create a transform file in Tuner:

- The first and the most common way is to begin by creating an empty transform and then making customization by navigating to different views in Tuner.

- The second way is by running the installation and then customizing various options available in each setup panel. The installation is only simulated and no changes take place on the user system. Tuner saves all the changes that the user has made on each panel of the setup in the transform. This type of transform is called a response transform.

Response transforms, much like installation response files, allow you to run an existing Windows Installer-based installation and capture your configurations. Unlike a response file, these changes are used as a starting point for your new transform.

For example, if you use Tuner to create a response transform, you might select certain features you want installed, the location of the installation, and company information. When the Tuner interface is opened, these values will already be set for your new transform file. You can then make further customizations as necessary.

You might want to create a response transform for an installation, and then fill in your company name as the default name, and a specific directory for installation which is different from the one suggested by the manufacturer. Further, you may want to configure a specific feature, such as clip art, to not be installed. By using the familiar installation user interface, you can quickly make your basic customizations before using the Tuner environment to refine the transform.

See Also
Creating New Transform Files

Viewing Transform Properties

To view properties of the transform you are currently creating or editing, select Properties from the File menu. To view the properties of a project from the Open a Recent Transform View, select the transform file and click Properties or right-click on the transform file and select Properties from the shortcut menu.

The resulting Properties dialog box provides information about the transform, including the name and location of the base Windows Installer file, and any additional transforms that are associated with this transform and MSI file.

Creating New Transform Files

Validation

AdminStudio 2019 | Tuner

What is Validation?

Validation is the process of comparing a Windows Installer-based installation to a known set of guidelines (an evaluation file) to ensure it has been created to those guidelines. Tuner can perform two types of validations: prevalidation and postvalidation.
• **Prevalidation** compares only the base Windows Installer package to an evaluation file. This ensures that, when starting a customization project, the initial file was created using the guidelines in that evaluation file. If it does not pass prevalidation, then the installation may work fine, but it may not be able to use all Windows Installer features.

• **Postvalidation** compares the base Windows Installer package and the changes made in a customization project against an evaluation file. In this case, the combination of the initial file and the subsequent modifications of the transform can produce different results than a comparison of just the base Windows Installer package. If the initial file was valid and postvalidation fails, the problems exist in the customization project. In some situations, advanced users may be able to use a transform file to make an initially invalid MSI file valid in conjunction with the transform.

**What Do You Validate Against?**

Tuner provides two files that you can validate against: the Windows 2000 Logo Program Suite and the Full MSI Validation Suite.

• The Windows 2000 Logo Program Suite is a subset of the Full MSI Validation Suite, and is used to certify that the installation meets the Microsoft standards for the Windows logo.

• The Full MSI Validation Suite is used to ensure that the installation meets all MSI standards.

**Validation Procedure**

Follow this procedure when validating an installation:

• In practice, you should prevalidate the base MSI file to ensure compliance to MSI standards before you begin creating a customization project.

• After you have finished your project, postvalidate it to make sure it is still compliant.

• If the base installation was compliant and the postvalidation fails, go back to the changes you made to determine what caused the validation problems.

For full details, consult the Windows Installer Help.

**See Also**

Prevalidating Windows Installer Packages
Handling Invalid Windows Installer Packages
Postvalidating Transforms
Evaluation Files and Internal Consistency Evaluators

**Prevalidating Windows Installer Packages**

Prevalidation compares only the base Windows Installer package to an evaluation file. This ensures that, when starting a customization project, the initial file was created using the guidelines in that evaluation file.
Performing a Prevalidation

Task

To prevalidate a Windows Installer package:

1. After creating a new transform file and specifying the base Windows Installer package, select the Prevalidation view from the checklist. The Prevalidation View appears, listing the name of the base Windows Installer Package.

2. Specify or browse to the Evaluation File you want to use.

3. If you want to run specific Internal Consistency Evaluators (ICEs), specify them in the ICEs to Run text box, separating them by semicolons if there are more than one (for example, ICE07;ICE13;ICE72). Otherwise, all ICEs are used.

4. Specify the result level by checking the Show “INFO” messages, Show “WARNING” messages, and/or Show “ERROR” messages check boxes. It is highly recommended that you check at least the Error check box so you are certain you are not suppressing results that occur in invalid packages.

5. Click the MSI Validation button ( ) on the toolbar, or click the Start button in the view.

Viewing the Prevalidation Results

As each ICE is run, Errors, Warnings, and Info messages are generated, and are listed in the Output tab at the bottom of the interface.

Upon completion of the Prevalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error ( ), a Warning ( ), or an Informational Message ( ), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red.

This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform. For more information, see Directly Editing Packages.

Note • If no errors appear in the results (providing you are displaying errors), then the package is valid against the specific ICEs you specified, or against the entire evaluation file (if no ICEs were selected).
Handling Invalid Windows Installer Packages

Ideally, all Windows Installer packages will pass validation. Realistically, many will fail (generating errors). When a package fails validation, it means the package was not built to Microsoft’s specifications. It does not mean the installation does not work. However, there are a few things you can do when your package has validation errors:

Table 14-2 • Methods to Resolve Validation Errors

<table>
<thead>
<tr>
<th>Solution</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Tuner to correct validation errors.</td>
<td>This involves opening the base package using Tuner and creating a transform file which contains your corrections.</td>
</tr>
<tr>
<td>Contact the installation vendor.</td>
<td>The company that created the installation (usually the same company that created the software) may be able to resolve the validation issues and provide you with a valid setup. Be sure to provide the validation report to vendors so they know where to focus.</td>
</tr>
<tr>
<td>Reconsider using the application.</td>
<td>Although it might be an extreme reaction to an invalid package, there may be compelling reasons not to use an installation not built to Microsoft guidelines.</td>
</tr>
<tr>
<td>Ignore the problems and install anyway.</td>
<td>This is probably the most likely scenario. The invalid installation may not be worth trying to fix, or even have errors that you are concerned about. You could proceed and just use the installation as it is. From a practical standpoint, this may be your best option.</td>
</tr>
</tbody>
</table>

Note • Most packages will also generate Warnings during validation. These can occur in valid packages, and many cannot be removed. Although the presence of Warnings does not make a package invalid, it is generally a good practice to eliminate Warnings (if possible).

Postvalidating Transforms

Task
To postvalidate a Windows Installer package and the transform you are creating:

1. Select the Postvalidation view from the checklist. The Postvalidation view appears, listing the name of the base Windows Installer Package.
2. Specify or browse to the Evaluation File you want to use.
3. If you want to run specific Internal Consistency Evaluators (ICEs), specify them in the ICEs to Run text box, separating them by semicolons if there are more than one (for example, ICE07;ICE13;ICE72). Otherwise, all ICEs are used.
4. Specify the result level by checking the Show “INFO” messages, Show “WARNING” messages, and/or Show “ERROR” messages check boxes. It is highly recommended that you check at least the Error check box so you are certain you are not suppressing results that occur in invalid packages.

5. Click the Transform Validation button (') on the toolbar, or click the Start button in the view.

**Viewing the Postvalidation Results**

As each ICE is run, Errors, Warnings, and Info messages are generated, and are listed in the Output tab at the bottom of the interface.

Upon completion of the Postvalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error ( ), a Warning ( ), or an Informational Message ( ), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red.

This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform. For more information, see Directly Editing Packages.

---

**Note** • If no errors appear in the results (providing you are displaying errors), then the package and transform are valid against the specific ICES you specified, or against the entire evaluation file (if no ICES were selected).

**Tip** • It is possible for a package that passed the prevalidation to fail the postvalidation. Remember changes made in the Setup Properties can affect your installation. If your package fails postvalidation, check all changes made in the Setup Properties for accuracy. To identify the original Setup Properties, you can create a new transform file that can be deleted at any time. Changes made using the Direct Editor can also affect your installation’s functionality.

**Evaluation Files and Internal Consistency Evaluators**

AdminStudio 2019 | Tuner

When you prevalidate the base Windows Installer package, or postvalidate the package and your transform, Tuner runs several Internal Consistency Evaluators (ICES) contained in the specified evaluation file. If the base package or your transform and package does not pass one of these ICES, Tuner reports the failure. If the problem is in the base package, you can contact the software vendor to report the problem.

ICE Reference (Windows Installer Online Help)

**Setup Organization**

AdminStudio 2019 | Tuner

The Organization View allows you to modify two main parts of the installation that your end users will see: the default path and default company name, and the actual features that can, will, or will not be installed.
Topics in this section include the following:

- Changing a Feature's Visibility
- Setting the Initial State of a Feature
- Editing a Feature's Description
- Setting the Default Destination
- Setting the Default Organization
- Changing the Destination Variable
- Preventing Features from Displaying During Custom Installation
- Setting Feature Properties
- Using Feature Advertisement

### Changing a Feature's Visibility

**AdminStudio 2019 | Tuner**

<table>
<thead>
<tr>
<th>Task</th>
<th>To change the visibility of a feature:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Under Organization in the checklist, select the Features View. This project's Features are listed in the second column.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the feature that you would like to change the visibility on. The Properties for that feature are listed.</td>
</tr>
<tr>
<td>3.</td>
<td>Click in the Visible property in the Feature Properties grid and make a selection from the drop-down menu. Your options are:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Visible</td>
<td>The feature will not show up in the custom setup dialog box during installation.</td>
</tr>
<tr>
<td>Visible and Expanded</td>
<td>The feature will be displayed with all its subfeatures visible in the custom setup dialog box during installation.</td>
</tr>
<tr>
<td>Visible and Collapsed</td>
<td>The feature will be displayed in a collapsed state in the custom setup dialog box during installation.</td>
</tr>
</tbody>
</table>

### Setting the Initial State of a Feature

**AdminStudio 2019 | Tuner**

<table>
<thead>
<tr>
<th>Task</th>
<th>To set the Initial State of a feature:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Under Organization in the checklist, select the Features view. This project's Features are listed in the second column.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the feature that you would like to change the initial state of. The Properties for that feature are listed.</td>
</tr>
</tbody>
</table>
3. Click in the Initial State property in the Feature Properties grid and choose one of the selections from the drop-down menu. Your selections are:
   - The feature is not installed: By default, the feature will not be installed during setup.
   - The feature is installed on the local drive: By default, the feature will be installed on the local drive during setup.
   - The feature is run from source, CD, or the network: By default, the feature will be run from the source, whether it be from the installation CD or from the network.
   - The feature is advertised: By default, the feature will be advertised, but not installed. Essentially, this is an on-demand option; a shortcut will be created during setup, and if the shortcut is clicked, the feature will then be installed from the source. This ensures features that may be unnecessary are not installed until they are needed, if ever. For more information, see Using Feature Advertisement.

   **Note** • The initial default settings run the Setup in a quiet mode.

### Editing a Feature's Description

**AdminStudio 2019 | Tuner**

**Task**  
**To edit a feature's description:**

1. Under Organization in the checklist, select the Features view. This project’s Features are listed in the second column.
2. Select the feature that you would like to change the description of. The Properties for that feature are listed.
3. Click in the Description property in the Feature Properties grid.
4. Enter the new feature description in the Description value cell.

### Setting the Default Destination

**AdminStudio 2019 | Tuner**

**Task**  
**To specify the Default Destination Path for an installation:**

2. Click in the Default Destination Path property in the Product Properties grid.
3. Provide the path that you want to use as the Default Destination Path.

**Caution** • Consult the Product Properties View help topic for important information about the Default Destination Variable and how it can be affected by changing this value.
Setting the Default Organization

To specify the default organization for the installation:

2. Click in the Company Name property in the Product Properties grid.
3. Enter the name you want to use as the default organization name. The organization name can be a maximum of 30 characters in length.

Changing the Destination Variable

To specify the Destination Variable that holds the Default Destination Path:

2. Click in the Default Destination Variable property in the Product Properties grid.
3. Select the Default Destination Variable you want to use from the drop-down menu.

Caution • Consult the Product Properties View help topic for important information about this variable.

Preventing Features from Displaying During Custom Installation

To prevent a feature from being displayed to your end users during a custom installation:

1. Under Organization in the checklist, select the Features View. This project's Features are listed in the second column.
2. Select the feature that you would like to hide. The Properties grid for that feature appears.
3. Click in the Visible property in the Properties grid and select Not Visible from the drop-down menu.

The feature selected will not be visible during custom installation. Depending on the feature's Initial State, the feature may or may not be installed on the end user's system.
Setting Feature Properties

AdminStudio 2019 | Tuner

<table>
<thead>
<tr>
<th>Task</th>
<th>To set Feature Properties:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Select Features under Organization in the checklist.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the Feature that you want to edit. The Feature Properties view appears.</td>
</tr>
<tr>
<td>3.</td>
<td>In the Description text box, enter a description that will be displayed when a feature is clicked in the Custom Setup dialog box.</td>
</tr>
<tr>
<td>4.</td>
<td>From the Visible drop down list, select an option to specify how the feature is presented to the end user in the Custom Setup dialog. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• Visible and Collapsed: The feature will be displayed in the Custom Setup dialog with its subfeatures collapsed by default.</td>
</tr>
<tr>
<td></td>
<td>• Visible and Expanded: The feature will be displayed in the Custom Setup dialog with its subfeatures expanded by default.</td>
</tr>
<tr>
<td></td>
<td>• Not Visible: The feature will not be displayed to the end user in the Custom Setup dialog.</td>
</tr>
<tr>
<td></td>
<td>Although an end user obviously cannot select or deselect an invisible feature, this property does not have any direct bearing on whether a feature is installed. In other words, a feature is not automatically installed if it is invisible; it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed.</td>
</tr>
<tr>
<td>5.</td>
<td>From the Initial State list, select an option to determine how (or if) the feature is installed during installation:</td>
</tr>
<tr>
<td></td>
<td>• The feature is not installed (INSTALLSTATE_ABSENT): The feature will not be installed during setup.</td>
</tr>
<tr>
<td></td>
<td>• The feature is installed on the local drive (INSTALLSTATE_LOCAL): The feature will be installed on the local drive during setup.</td>
</tr>
<tr>
<td></td>
<td>• The feature is run from source, CD, or network (INSTALLSTATE_SOURCE): The feature will be run from the source, whether it is from the installation CD or from the network.</td>
</tr>
<tr>
<td></td>
<td>• The feature is advertised (INSTALLSTATE_ADVERTISED): The feature will be advertised, but not installed. Essentially, this is an on-demand option; a shortcut will be created during setup, and if the shortcut is clicked, the feature will then be installed from the source. This ensures features that may be unnecessary are not installed until they are needed, if ever. For more information, see Using Feature Advertisement.</td>
</tr>
</tbody>
</table>

Using Feature Advertisement

AdminStudio 2019 | Tuner

Windows Installer supports many features of Windows 2000 and later platforms, including feature advertisement. This convenience enables any product feature to be in one of four installation states:

• The feature is not installed
• The feature is installed on the local drive
• The feature is run from source, CD, or the network
The feature is advertised

When features are advertised, they are not actually installed on the local system. However, they appear to be, in that the appropriate shortcuts to launch the feature are present. The first time a user attempts to use a feature that is advertised, it is installed on the computer.

Note • For instructions on how to specify feature advertisement and the other installation states of a feature, see Setting the Initial State of a Feature.

Configuring Package Content

Many modifications you can make in a transform file involve manipulating the original package contents. This includes the following:

• Files and Folders
• Registry Entries
• Shortcuts
• INI Files
• ODBC Resources
• NT Services

Files and Folders

From the Files and Folders view, you can perform all file operations in Tuner. This includes viewing files in the source MSI package, adding new files, preventing files from being installed, and removing added files.

Topics in this section include the following:

• Adding Files
• Displaying Files from the Base Windows Installer Package
• Preventing Installation of Files from the MSI
• Removing Added Files
• Storing Added Files
Adding Files

AdminStudio 2019 | Tuner

**Task**

**To add files to an installation:**

1. Select the Files and Folders view from the checklist. The Files and Folders View appears.
2. Navigate to the location in the Source computer’s directory tree that contains the file you want to add.
3. Select the file you want to add from the Source computer’s files pane.
4. Drag the file to the appropriate folder in the Destination computer’s folders tree. The file then appears in the Destination computer’s files pane, with an icon indicating that it is an added file.

![File was added to installation.]

Displaying Files from the Base Windows Installer Package

AdminStudio 2019 | Tuner

**Task**

**To display files from the base Windows Installer package in the Files and Folders view:**

1. Select Options from the Tools menu to display the Options dialog box.
2. Select the View Settings tab. The Option Dialog’s View Settings pane opens.
3. Select the Display files from the original MSI package in addition to files added in the transform check box.
4. Click OK.

When you return to the Files and Folders view, all files from the base Windows Installer package are displayed as well as the files added in the transform. By default, this option is enabled.

Preventing Installation of Files from the MSI

AdminStudio 2019 | Tuner

**Task**

**To prevent files from the base Windows Installer package from being installed:**

1. Select Files and Folders from the checklist. The Files and Folders View opens.
2. Navigate to the folder which contains the file in the Destination computer’s folders tree that you want to remove from the installation.
3. In the Destination computer’s files pane, right-click on the file you want to prevent from being installed and select **Remove** from the shortcut menu.
The actual file within the Windows Installer package is not deleted—only the entry in the File table is removed. The icon for the file changes to a computer with a red “X” over it.

- Register.exe
- tps.txt
- FCache62.JDB

If you remove a file, and later want to restore it to the installation, simply right-click the file again and select Restore.

---

**Note** • Key files in the base Windows Installer package are denoted with a key icon, and cannot be marked for deletion. Additionally, files contained within cabinet (.CAB) files are not displayed, and therefore cannot be marked for deletion.

### Removing Added Files

**Task**  
To remove files you have added to an installation:

1. Select Files and Folders from the checklist. The Files and Folders view opens.
2. In the Destination computer’s folders tree, navigate to the folder containing the added file that you want to remove.
3. In the Destination computer’s Files pane, do one of the following:
   - Select the file you want to remove and press the Delete key.
   - Right-click on the file you want to remove and select Remove from the shortcut menu.

### Storing Added Files

**Task**  
When you add files to a transform, Tuner stores them in a CAB file with the same name as your transform. The added files are placed in the CAB and Tuner no longer maintains a reference to the original file location on the source computer. If you add additional files after saving the transform, the contents of the CAB file are extracted and recompressed along with the new files.

Because this mechanism relies on the presence of the CAB file, this file must be stored in the same location as the transform. If you move, modify, or delete the CAB file, Tuner will no longer be able to include the added files in the transform. You must then delete the files from the Files and Folders View and re-add them from their original locations, or locate the original CAB and place it back in the same folder as the transform.

Also, because the contents of the CAB file are uncompressed and recompressed when you add subsequent files to the installation, you must have sufficient disk space for this extraction when you save the transform.
Registry Entries

You can use the Registry view to create keys and values similar to how you use the Windows Registry Editor, or you can copy or drag and drop existing keys and values from the Source view.

Further, you can use this view to import an existing REG file using the Registry Import Wizard. You can also modify or delete registry keys that are part of the base installation. If you add new registry keys, they will always be installed.

Topics in this section include the following:

- Creating a Registry Key
- Creating a Registry Value
- Importing REG Files
- Removing Registry Information

Creating a Registry Key

Task To specify a registry key that will be created on the target system:

1. Select Registry from the checklist. The Registry View opens.
2. In the Destination Computer Registry View, select the key to which you want to add a value. All existing values for that key in the Destination Computer Registry Data pane are displayed.
3. To create a subkey, right-click on a registry hive (such as HKEY_CURRENT_USER) or an existing key, point to New on the shortcut menu, and select Key.

   A new key is created with the name “NewKeyn” (where n is a successive number).
4. Enter a meaningful name now to rename the key. If you want to change the name later, right-click on the key and select Rename.
5. Right-click on the new key and select whether the key is to be created on installation, deleted on uninstallation, or both.

Choose one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Key at Install</td>
<td>Creates the new registry key during installation if the key does not exist on the target machine.</td>
</tr>
<tr>
<td>Delete Key at Uninstall</td>
<td>Deletes the registry key during uninstallation, regardless of whether they key existed prior to the MSI's installation. This means that the key, and all its contents and sub-keys, will be removed regardless of whether other software information that is unrelated to this MSI exists. This can have a severe impact on other programs; only select this option if you are sure that the only software affected is the base MSI.</td>
</tr>
</tbody>
</table>
Creating a Registry Value

Adding a New Value Name

To add a new value name:

1. Select Registry from the checklist. The Registry View opens.
2. Select the key to which you want to add a value from the Destination Computer Registry view. Existing values for the key are displayed in the Destination Computer Registry Data view.
3. Right-click in the list of values and select New String Value, New Binary Value, or New DWORD Value, depending on the type of data you want to register.
   A new empty value name is created with the name “New Value #n” (where n is a successive number).
4. Enter a meaningful name now to rename the value. To rename the value later, right-click on the value name and select Rename.

Note • When creating binary values, Tuner automatically converts whatever input you provide into a binary value.

Modifying the Value Data

Each new key has an empty default string value.

To modify this or any value data:

1. Right-click on a value name and select Modify. The Edit Data dialog box opens.
2. In the Value data text box, enter a new value or edit the existing value.
3. Click OK.
Importing REG Files

Tuner allows you to import any existing REG files that you may have created previously. To import a REG file you need to launch the Registry Import Wizard.

**Task**

**To import a REG file:**

1. Select Registry from the checklist. The Registry View opens.
2. Right-click on a registry hive in the Destination Computer Registry View and select Import REG File. The Welcome panel of the Import REG File Wizard appears.
3. On the Welcome panel, click Next. The Import Registry File panel appears.
4. In the Registry File text box, either type the location of the registry file or browse to it, and click Next. The Import Conflict Options panel appears.
5. Select how you would like to handle duplicate registry data during the import. You have two options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overwrite the registry data</td>
<td>If any conflicts exist, the old registry keys will be overwritten by the new keys.</td>
</tr>
<tr>
<td>Do not overwrite the registry data</td>
<td>If duplicate keys are encountered, keep the existing keys.</td>
</tr>
</tbody>
</table>

6. After you have selected the method, click Import to continue. The Finishing Registry Import panel appears.
7. After the registry file has been scanned, click Finish to insert all entries from the REG file into the Destination Computer Registry view. You can then modify the entries.

Removing Registry Information

**Task**

**To remove registry information:**

1. Select Registry from the checklist. The Registry View opens.
2. Navigate to the registry entry that you want to remove in the Destination Computer Registry View.
3. If you want to remove a value from a specific key, right-click on the value in the Destination Computer Registry Data pane and select Delete.
4. If you want to remove an entire key, right-click on the key in the Destination Computer Registry View pane and select Delete or press the Delete key.
Shortcuts

AdminStudio 2019 | Tuner

The Shortcuts view offers an integrated, visual method for adding shortcuts and program folders to the installation. Existing shortcuts can also be modified or removed.

Shortcuts can be placed in:

- folders already defined by the installation,
- standard folders that are predefined by the Windows Installer such as the Fonts folder, or
- new folders which you can create.

Each shortcut has several properties that specify the target program, hot key combination, icon, and other information necessary to launch the application. When you create a new shortcut, it will always be installed.

Note • Shortcuts created in the transform are denoted by ☑ and shortcuts from the base Windows Installer package are denoted by ☑.

Topics in this section include the following:

- Creating Shortcuts
- Changing a Shortcut’s Icon
- Change a Shortcut’s Location
- Changing a Shortcut’s Target
- Creating a Hot Key
- Removing Shortcuts
- Determining the Path of Changed Shortcuts

Creating Shortcuts

AdminStudio 2019 | Tuner

Task

<table>
<thead>
<tr>
<th>Task</th>
<th>To create a shortcut:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Select Shortcuts from the checklist. The Shortcuts View opens.</td>
</tr>
<tr>
<td>2.</td>
<td>In the Shortcuts folder tree, navigate to the folder in which you want to put the shortcut.</td>
</tr>
<tr>
<td>3.</td>
<td>Right-click on the folder and select New Shortcut.</td>
</tr>
<tr>
<td>4.</td>
<td>Provide a name for the shortcut.</td>
</tr>
<tr>
<td>5.</td>
<td>Enter properties for the shortcut in the Properties Grid.</td>
</tr>
</tbody>
</table>
Chapter 14 Customizing Installations Using Tuner
Configuring Package Content

Changing a Shortcut's Icon

AdminStudio 2019 | Tuner

Task

To change the icon used for a shortcut:

1. Select Shortcuts from the checklist. The Shortcuts View opens.
2. In the Shortcuts folder tree, navigate to the folder containing the shortcut you want to edit.
3. Select the Icon property from the Properties Grid.
4. Click the Change Icon button in the pane below the grid. The Change Icon dialog box opens.
5. Select one of the displayed icons or browse to the file that contains the icon you want to use for the shortcut.
6. After you have selected the appropriate icon, click OK. The new icon is now displayed to the left of the Change Icon button.

Change a Shortcut's Location

AdminStudio 2019 | Tuner

Task

To change a shortcut’s location:

1. Select Shortcuts from the checklist. The Shortcuts View opens.
2. In the Shortcuts folder tree, navigate to the folder containing the shortcut you want to move.
3. Select the shortcut and drag it to another folder in the Shortcuts tree.

Changing a Shortcut's Target

AdminStudio 2019 | Tuner

Task

To change a shortcut’s target:

1. Select Shortcuts from the checklist. The Shortcuts View opens.
2. In the Shortcuts folder tree, navigate to the folder containing the appropriate shortcut.
3. Select the Target property from the Properties Grid.
4. Select the appropriate Target from the list. The Target Type that is selected affects what you should enter in the Target property field:
   - File from MSI Package & File from File System: Provide the full path to the application or batch file.
   - Destination Folder: Select a folder name from the drop-down list. The list includes available folders on the target system, from the MSI package, and from the transform.
• **Advertised Shortcut:** Enter the feature name. You can determine the name of the feature by going to the Direct Editor and selecting the Feature table. The list of features that you can target is listed in the Features column of the table.

## Creating a Hot Key

**AdminStudio 2019 | Tuner**

A Hot Key is a combination of keys used to launch a shortcut instead of using the mouse.

### Task

**To create a hot key:**

1. Select Shortcuts from the checklist. The Shortcuts View opens.
2. Select the shortcut to which you want to add the Hot Key.
3. Click on the Hot Key field in the properties grid. The Hot Key dialog box opens.
4. Press the keys on the keyboard that you want to use for the shortcut. The shortcut appears in the dialog.
5. If the shortcut is correct, click OK. The dialog box closes and the shortcut’s converted ASCII value appears as the value for the Hot Key.

**Note** • These four fields in the Shortcuts Property Box are required for creating a Hot Key: Icon, Target, Run, and Hot Key. When you are creating the Hot Key Combination, DO NOT use a keyboard combination already adopted by Microsoft (such as Ctrl+V, which is used for Paste). Otherwise, the shortcut will not work.

## Removing Shortcuts

**AdminStudio 2019 | Tuner**

### Task

**To remove a shortcut:**

1. Select Shortcuts from the checklist. The Shortcuts View opens.
2. Use the Shortcuts Tree to navigate to the shortcut you want to delete.
3. Right-click on the shortcut and select Delete to remove it.

## Determining the Path of Changed Shortcuts

**AdminStudio 2019 | Tuner**

### Task

**To determine the actual path of a changed shortcut:**

1. Go to the Direct Editor and select the Directory table.
2. Find the shortcut Target directory, such as INSTALLDIR.
3. In that Directory row, find the value in the Directory_Parent column. In this example, the value is DIR26.

4. Look for a row in the Directory column that does not have a Directory_Parent entry. The directory in the row that has no value in the Directory_Parent column is the root directory. In this example, the root directory is TARGETDIR.

Shortcuts View/Shortcut Target

INI Files

INI Files serve as a repository in which you can store and retrieve information between uses of your application. Typically INI Files contain key name-value pairs representing run-time options for applications. Some .ini files, such as Boot.ini and Wininit.ini, are used by the operating system.

INI files are divided into sections, each section containing keywords. Sections are divided by the square brackets surrounding them—[SectionName], for example. INI file keywords are the lowest level of organization in an .ini file. These keywords store data that must persist between uses of an application.

The INI Files View provides a graphical way for users to add, modify, or delete the contents of the IniFile Table. It displays the contents of the IniFile table from the source Windows Installer package and the transform.

Topics in this section include the following:

- Adding INI Files
- Importing Existing INI Files
- Adding Sections to INI Files
- Adding New Keys to INI File Sections
- Modifying INI File Keys, Values, and Actions
- Removing INI Files
- Removing Sections from INI Files
- Removing INI File Section Keys

Adding INI Files

Task To add an INI file to your transform file:

1. Select INI Files from the checklist. The INI Files View opens.
2. Right-click on the appropriate destination folder in the INI File tree and select New IniFile.
3. To rename the new INI file, right click on IniFile#.ini and select Rename from the shortcut menu.
4. To rename the new INI section, right click on NewSection#.ini and select Rename from the shortcut menu.
5. With the new INI section selected, enter a Key name, Value, and Action for the default INI key value. See Modifying INI File Keys, Values, and Actions.

6. Add additional Sections and Keys, as described in Adding Sections to INI Files and Adding New Keys to INI File Sections.

Importing Existing INI Files

AdminStudio 2019 | Tuner

To import an existing INI file:

1. Select INI Files from the checklist. The INI Files View opens.

2. Right-click on the appropriate destination folder in the INI File tree and select Import INI File from the shortcut menu. The Welcome Panel of the Import INI File Wizard opens.

3. Click Next. The Import INI File Panel opens.

4. Enter or browse to the INI file you want to import. Click Next. The Import Conflict Options Panel opens.

5. Select how you want to handle duplicate keys and values. Click Import.

6. Once the INI file has been imported, click Finish.

The imported INI file appears under the selected destination folder. You can then make further adjustments to it as needed.

Adding Sections to INI Files

AdminStudio 2019 | Tuner

To add a section to an INI file:

1. Select the INI Files View from the checklist.

2. Right-click on the appropriate INI File in the INI File tree and select New Section from the shortcut menu. A new INI section, named NewSection1, is created under the selected INI file, complete with a default Key name, Value, and Action.

3. To rename the new section, right-click on NewSection1 and select Rename from the shortcut menu.

4. With the new INI section selected, enter a Key name, Value, and Action for the default INI key value. See Modifying INI File Keys, Values, and Actions.

5. Add additional Keys to this new INI file section as necessary. See Adding New Keys to INI File Sections.
Adding New Keys to INI File Sections

AdminStudio 2019 | Tuner

**Task**

To add a new INI file key:

1. Select the INI Files View from the checklist.
2. Expand the listing of the INI file that you would like to edit so that all of its sections are displayed.
3. Select the INI file section that you would like to edit. That section’s defined keys are listed on the right.
4. Right-click in the key listing and select Add from the menu. A new key is added to the key listing with a default Key name, Value and Action.
5. Edit the Key name, Value, and Action for this new Key. See Modifying INI File Keys, Values, and Actions.

Modifying INI File Keys, Values, and Actions

AdminStudio 2019 | Tuner

INI files contain key name-value pairs representing run-time options for applications. To define and modify the key names, values, and/or actions, perform the following steps.

**Task**

To modify keys, values, and/or actions in INI files:

1. Select the INI Files View from the checklist.
2. In the INI File tree, select the INI file that you want to edit, and expand the listing so that you can select the appropriate section. That section’s keys, values, and actions are listed:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>The name of the key. This should be entered in the exact way you want it to appear in the target INI file.</td>
</tr>
</tbody>
</table>
Removing INI Files

AdminStudio 2019 | Tuner

Task  To remove an INI file:

1. Select the INI File view from the checklist.
2. From the INI File tree, right-click on the INI file you want to delete and select Remove.

Removing Sections from INI Files

AdminStudio 2019 | Tuner

Task  To remove a section from INI file:

1. Select the INI File view from the checklist.
2. From the INI File tree, right-click on the section you want to delete and select Remove.

Removing INI File Section Keys

AdminStudio 2019 | Tuner

Task  To remove an INI file section key:

1. Select the INI Files view from the checklist.
2. Select the INI File section that contains the key you want to delete from the INI Files tree.
3. Right-click the key you want to remove and select Delete.

### Option | Description
--- | ---
| Value | The key’s value. Windows Installer properties can be used in your keyword’s value. To do this, surround the property with square brackets—[INSTALLDIR], for example. For a comprehensive list of Windows Installer properties, refer to the Property Reference topic in the Windows Installer help.
| Action | The action the key performs. Select this from the list in the property sheet. The available options are:
  - **Add Tag**: Creates a new entry or appends a new comma-separated value to an existing entry.
  - **Create Line**: Creates a .ini entry only if the entry does not already exist.
  - **Add Line**: Creates or updates a .ini entry.
ODBC Resources

Open Database Connectivity (ODBC) Resources are ones that involve interaction with databases. Tuner allows you to view existing ODBC Data Sources, ODBC Drivers, and ODBC Translators.

Topics in this section include the following:

- Adding New Data Sources
- Adding New ODBC Data Source Attributes
- Adding New ODBC Driver Attributes
- Editing ODBC Data Source Attributes
- Editing ODBC Driver Attributes
- Removing Existing ODBC Data Sources
- Removing ODBC Driver Attributes
- Removing ODBC Data Source Attributes

Adding New Data Sources

To add a new ODBC Data Source:

1. Select ODBC Resources from the checklist. The ODBC Resources View opens.
2. Right-click either ODBC Data Sources group or one of its children groups from the ODBC Resources tree and select New Data Source from the shortcut menu. The ODBC Data Source dialog box opens.
3. Select the required data source and click OK.

Caution • If you are adding an ODBC Data Source that does not exist on your computer, type the name of the Data Source into the ODBC Data Source dialog. Keep in mind that adding a data source to a Windows Installer package that does not contain the corresponding driver may render the package useless.
Adding New ODBC Data Source Attributes
AdminStudio 2019 | Tuner

Task  To add a new ODBC data source attribute:
1. Select ODBC Resources from the checklist. The ODBC Resources View opens.
2. Select the ODBC Data Source to which you want to add a new attribute from the ODBC Resources tree. The property grid for the selected ODBC Data source opens.
3. Right-click in the property grid and select Add. A new attribute is listed, with the default values of ATTRIBUTE and NULL_VALUE.
4. Enter information for the new attribute.

Adding New ODBC Driver Attributes
AdminStudio 2019 | Tuner

Task  To add a new ODBC driver attribute:
1. Select ODBC Resources from the checklist. The ODBC Resources View opens.
2. Select the ODBC driver to which you want to add a new attribute from the ODBC Resources tree. The property grid for the selected ODBC driver appears.
3. Right-click in the property grid and select Add from the shortcut menu. A new attribute is listed, with the default values of ATTRIBUTE and NULL_VALUE.
4. Enter information for the new attribute.

Editing ODBC Data Source Attributes
AdminStudio 2019 | Tuner

Task  To edit an ODBC data source attribute:
1. On the ODBC Resources View, select the ODBC data source that contains the attribute you want to modify from the ODBC Resources tree. The property grid for that data source appears.
2. In the properties grid, edit the appropriate attribute.
Editing ODBC Driver Attributes

To edit an ODBC driver attribute:

1. On the ODBC Resources View, select the ODBC driver that contains the attribute you want to modify from the ODBC Resources tree. The property grid for that ODBC driver appears.
2. In the properties sheet, edit the appropriate attribute.

Removing Existing ODBC Data Sources

To remove an existing ODBC Data Source:

1. Select the ODBC Resources view from the checklist.
2. Right-click on the ODBC data source you want to remove from the ODBC Resources tree and select Delete.

Removing ODBC Driver Attributes

To remove an ODBC driver attribute:

1. Select the ODBC Resources view from the checklist.
2. Select the ODBC driver that contains the attribute you want to delete from the ODBC Resources tree.
3. In the properties sheet, right-click on the attribute you want to remove and select Delete.

Removing ODBC Data Source Attributes

To remove an ODBC data source attribute:

1. Select the ODBC Resources view from the checklist.
2. Select the ODBC data source that contains the attribute you want to delete from the ODBC Resources tree.
3. In the properties sheet, right-click on the attribute you want to remove and select Delete.
NT Services

The NT Services view provides a way to change parameters for NT Services included in the base Windows Installer package. Topics in this section include the following:

- Setting NT Service Arguments
- Setting NT Service Dependencies
- Setting the NT Service Description
- Setting the NT Service Display Name
- Setting the NT Service Error Control Level
- Setting the NT Service Load Order Group
- Setting the NT Service Overall Install Result
- Setting the NT Service Start Type
- Setting NT Service Start Name and Password
- Setting the NT Service Type

Setting NT Service Arguments

Task To set NT service arguments:

1. Select the NT Services from the checklist. The NT Services View opens.
2. Double-click the current value in the properties grid and modify it as needed.

Setting NT Service Dependencies

Task To set NT service dependencies:

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Dependencies value in the properties grid and add the names of services or load ordering groups that must be started prior to this service.

Note • If the dependency is on a load ordering group, the service can start if at least one member of the load ordering group is running after an attempt is made to start all load ordering group members.
Setting the NT Service Description

Task To set the NT service description:

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Description value in the properties grid and modify it as needed.

Setting the NT Service Display Name

Task To set the NT service display name:

1. Select the NT Services view from the checklist.
2. Double-click the current Display Name value and modify it. The display name can be up to 256 characters in length.

Setting the NT Service Error Control Level

Task To set the NT service error control level:

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Error Control value in the properties grid to access the pop-up menu. The possible values are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore Error</td>
<td>Logs the error and continues with service startup.</td>
</tr>
<tr>
<td>Normal Error</td>
<td>Logs the error, displays an error message, and continues with service startup.</td>
</tr>
<tr>
<td>Critical Error</td>
<td>Logs the error (if possible) and restarts the system with the last configuration known to be good. If the last-known-good configuration is the one that caused the error, fail the startup.</td>
</tr>
</tbody>
</table>
Chapter 14 Customizing Installations Using Tuner

Configuring Package Content

Setting the NT Service Load Order Group

**Task**

*To set the NT service load order group:*

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Load Order Group value in the properties grid and modify it as needed. If this service does not belong to a group, leave this value blank.

Setting the NT Service Overall Install Result

**Task**

*To set the NT service overall install result:*

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Overall Install value in the properties grid to access the drop-down menu.
3. Select either Continue overall install if service fails to install or Fail overall install if service fails to install as this property’s value.

Setting the NT Service Start Type

**Task**

*To set the NT service start type:*

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Start Type value in the properties grid to access the drop-down menu.
3. Select the desired Start Type from the following possible values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic</td>
<td>The service starts during system startup.</td>
</tr>
<tr>
<td>Manual</td>
<td>The service is only started when the service control manager calls the StartService function.</td>
</tr>
<tr>
<td>Disabled</td>
<td>The service is not started.</td>
</tr>
<tr>
<td>Start at Boot Time</td>
<td>The driver is started by the operating system loader. (Device driver only)</td>
</tr>
<tr>
<td>Started by the System</td>
<td>The driver is started by calling the IoInitSystem function. (Device driver only)</td>
</tr>
</tbody>
</table>
Setting NT Service Start Name and Password

Task

To set the NT service start name and password:

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Start Name value in the properties grid and provide the name under which this service will run.
3. Click the current Password value in the properties grid and provide the password associated with the Start Name.

Setting the NT Service Type

Task

To set the NT service type:

1. Select NT Services from the checklist. The NT Services View opens.
2. Double-click the current Service Type value in the properties grid to access the drop-down menu.
3. Select the desired Start Type from the following possible values:
   - Service that Runs in its Own Process
   - Service that Shares a Process with Others
4. Optional: click the current Interact with Desktop value in the properties grid to access the drop-down menu and specify whether the service needs to interact with the desktop.

Working with Dialogs

When customizing the Windows Installer package, you may want to disable particular panels that appear during the installation, administrative, patch, or maintenance sequences. You can do so from the Dialogs view. This view contains a list of each of the four installation modes (installation, administrative, maintenance, and patch), with the associated dialogs that appear as part of the UI sequence during the selected mode. You can enable or disable these dialogs by either the check box to the left of the dialog name, or by using the Show and Hide buttons.

Topics in this section include the following:

- Hiding Dialogs During UI Sequences
- Restoring Dialog Sequences
- Suppressing the License Agreement Dialog Box
- Disabling Custom Setups
- Editing Dialog Properties
Hiding Dialogs During UI Sequences

AdminStudio 2019 | Tuner

### Task

**To hide a dialog box during a UI sequence:**

1. Select Dialogs from the checklist. The Dialogs View opens.
2. Using the Installation Mode list, select the UI sequence containing the dialog you want to hide.
3. From the Dialogs list, clear the check mark next to the dialog you want to hide. Alternatively, select the dialog from the list and either click Hide or press the Space Bar.
4. If necessary set the properties for the dialog you are removing to preserve the UI sequence integrity. The Dialog Properties dialog box automatically appears if it is necessary to edit properties.

Restoring Dialog Sequences

AdminStudio 2019 | Tuner

### Task

**To restore dialogs in a UI sequence:**

1. Select Dialogs from the checklist. The Dialogs View opens.
2. Using the Installation Mode list, select the UI sequence containing the dialog you want to restore.
3. From the Dialogs list, check the box next to the dialog you want to restore. Alternatively, select the dialog from the list and either click Show or press the Space Bar.

Suppressing the License Agreement Dialog Box

AdminStudio 2019 | Tuner

Using the Dialogs view, it is possible to suppress the license acceptance dialog. This involves both turning off its display, and providing the value that the setup will interpret as acceptance of the agreement.

**Note** • This procedure assumes the original Windows Installer setup was created using InstallShield Editor. If another setup authoring application was used, the names of dialogs and properties may not be the same. The same general procedure still applies.
Task  To use a transform to suppress display of the license acceptance dialog:

1. Select Dialogs from the checklist. The Dialogs View opens.
2. Using the Installation Mode list, select the UI sequence containing the License Agreement dialog. Typically, this is only in the Installation Sequence.
3. Select the LicenseAgreement dialog from the Dialogs list and click Hide.
4. When the Dialog Properties dialog box appears, change the AgreeToLicense value to Yes.
5. Click OK to dismiss the dialog.

When an end user runs the installation using this transform, the License Agreement dialog will not appear.

Disabling Custom Setups

You can use the Dialogs view to prevent users from performing custom setups. However, this requires not only the elimination of the Custom Setup panel during installation, but also the Setup Types panel. Additionally, you must ensure you have configured the features you want installed, as your end user will have no way to override them.

Note • This procedure assumes the original Windows Installer setup was created using InstallShield Editor. If another setup authoring application was used, the names of dialogs and properties may not be the same. The same general procedure still applies.

Task  To use a transform to disable a custom setup:

1. Select Dialogs from the checklist. The Dialogs View opens.
2. Using the Installation Mode list, select the UI sequence containing the SetupType dialog. Typically, this is only in the Installation Sequence.
3. Select the SetupType dialog from the Dialogs list and click Hide.
4. When the Dialog Properties dialog box appears, change the ADDLOCAL value to ALL.
5. Click OK to dismiss the dialog.
6. Select the CustomSetup dialog from the Dialogs list and click Hide.
7. When the Dialog Properties dialog box opens, change the _BrowseProperty value to INSTALLDIR.
8. Click OK to dismiss the dialog.

When an end user runs the installation using this transform, the user will not have the option to perform a custom setup.
Editing Dialog Properties

AdminStudio 2019 | Tuner

<table>
<thead>
<tr>
<th>Task</th>
<th>To edit properties for a UI sequence dialog:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Select Dialogs from the checklist. The Dialogs View opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Using the Installation Mode list, select the UI sequence containing the dialog box containing properties you want to edit.</td>
</tr>
<tr>
<td>3.</td>
<td>From the Dialogs list, select the appropriate dialog.</td>
</tr>
<tr>
<td>4.</td>
<td>Click Properties. The Dialog Properties dialog box opens.</td>
</tr>
</tbody>
</table>

*Note* • *The Properties button is only enabled when you have selected a dialog box containing editable properties.*

| 5.   | From the Dialog Properties dialog box, double-click the value cell for the property you want to edit. |
| 6.   | Change the property value as necessary, and click OK. |

Dialogs View vs. Command-Line Options

AdminStudio 2019 | Tuner

Generally, you should use the Dialogs View when you are still planning on displaying some panels during UI sequences. Typically, you may want to remove the License Agreement panel or the ability for a user to perform a custom setup, and these can both be accomplished easily from the Dialogs View.

However, consider using the Windows Installer command-line options (particularly */qn*) when you want to eliminate the user interface entirely.

Dialog Suppression Issues

AdminStudio 2019 | Tuner

When suppressing dialog box display, it is important to consider some implications of your actions. Particularly, when removing a dialog from a user interface sequence, there may be properties normally set by that dialog. For example, the LicenseAgreement dialog has a radio button which can set a property to Yes or No, depending on whether you agree to the terms in the license. The value of this property also determines whether the installation should continue. Therefore, if you remove the LicenseAgreement dialog from a sequence, you need to use the Dialog Properties dialog box to set the value of this property so the installation can continue.

Beyond setting necessary properties, you also should consider how features are displayed. For example, you may want to disable custom setups via the transform file. However, you must ensure each feature you want installed is configured to be installed; your end users will have no way to override the choices by performing a custom setup.
Configuring Additional Server Locations

If you install from a network server, and if you install features to run from the server or that will be advertised for installation on their first use, the applications may need access to the server sometime after the initial installation. The applications may also require access to the server if a file is deleted or becomes corrupt, as the application can copy the problematic file(s) automatically from the server.

Topics in this section include the following:

- Adding Additional Server Locations
- Modifying Server Locations
- Removing Server Locations
- Reordering Server Locations

Adding Additional Server Locations

To add an additional server location:

1. Select Server Locations from the checklist. The Server Locations View opens.
2. Click the New button in the Addition Server Location Paths window.
3. Enter or click the Browse (...) button and browse to the server location.

Note • The validity of the server location is determined when the installation needs to access the server remotely. In other words, if a server is not available, or if you added an invalid server, the entry will be ignored if the resource is needed.

Modifying Server Locations

To modify an additional server location entry:

1. Select Server Locations from the checklist. The Server Locations View opens.
2. Select the server entry from the Addition Server Location Paths window and either edit the entry or use the Browse (...) button to browse to desired location.
Removing Server Locations

To remove an additional server location:

1. Select Server Locations from the checklist. The Server Locations View opens.
2. Select the server entry from the Addition Server Location Paths window.
3. Click the Remove button ( )

Reordering Server Locations

To change the order in which additional server locations are accessed:

1. Select Server Locations from the checklist. The Server Locations View opens.
2. Select a server entry from the Addition Server Location Paths window.
3. Depending on whether you want to promote the server location or demote it, click the up and down arrow buttons at the top right of the view ( ). You can also use the Alt+Up Arrow and Alt+Down Arrow keyboard shortcuts.
4. Repeat with other server location entries as necessary.

Changing Add/Remove Program Settings

Depending on how the Windows Installer setup is configured, the user has the option of removing, repairing, or changing the installation with the click of a button.

Topics in this section include the following:

- Changing Add/Remove Programs Properties
- Disabling the Modify, Remove, or Repair Buttons

Changing Add/Remove Programs Properties

To change properties in Add/Remove Programs:

1. Select Add/Remove Programs from the checklist. The Add/Remove Programs View opens.
2. Double-click the value for the property you want to change.
3. Either enter the information into the properties grid, or use the drop-down menu to select a value.

Disabling the Modify, Remove, or Repair Buttons

AdminStudio 2019 | Tuner

Task

To disable the Modify, Remove, or Repair buttons in Add/Remove Programs in Control Panel:

1. Select Add/Remove Programs from the checklist. The Add/Remove Programs View opens.
2. Double-click the appropriate Disable Modify/Remove/Repair Button property from the properties grid.
3. Use the drop-down menu to change the value to No.

Customizing Setup Properties

AdminStudio 2019 | Tuner

Even though Tuner provides you views to customize many areas of the Windows Installer package, it may be necessary to edit property values that are not available elsewhere. The Setup Properties view exposes the entries in the properties table (the underlying structure of Windows Installer packages). You can also add your own custom properties here.

Topics in this section include the following:

- Adding Custom Setup Properties
- Adding and Editing Comments
- Removing Custom Setup Properties
- Modifying Setup Properties

Adding Custom Setup Properties

AdminStudio 2019 | Tuner

Task

To add a new setup property:

2. Right-click in the properties grid and select Add. A New property is added to the bottom of the list with the a Property Name of NEWPROPERTY and a Value of NULL_VALUE.
3. Provide a new name for your property. If you want to change it later, click on the property name to edit it.
4. Enter the property’s value.
Adding and Editing Comments

AdminStudio 2019 | Tuner

Tuner supports the ability to add comments to each property available in the Setup Properties view. This provides a way to clarify what specific properties do, and to enter any important information that you may need later. The original software vendor may have used InstallShield Editor to include comments in the original Windows Installer package.

Task  To add or edit a comment for a property:

1. Select the Setup Properties view from the checklist.
2. Double-click in the comment column for the property to which you want to add or edit the comment.
3. Add or edit the comment as appropriate.

Removing Custom Setup Properties

AdminStudio 2019 | Tuner

Task  To remove a custom setup property:

2. Right-click on the property you want to remove and select Delete.
3. Confirm the deletion.

Modifying Setup Properties

AdminStudio 2019 | Tuner

Task  To modify the property value of a setup:

2. Select the property that you want to modify.
3. Double-click the property’s value and edit it in the grid.

Make sure you are entering valid values when you modify properties, otherwise validation or installation errors may result.
Preparing Packages for Distribution

The final step in creating a customization involves two parts. First, you should postvalidate your transform and base Windows Installer package. This ensures that you have not introduced any errors into the installation, and may help you verify that you have corrected errors that existed in the base package. Secondly, you need to actually package the transform and base package for distribution. These tasks are accomplished using the Postvalidation view and Package view, respectively.

Topics in this section include the following:

- Copying the Installation to a Network Location
- Copying the Installation to an FTP Server
- Creating a Package Definition File (PDF)
- Creating an SMS File
- Instructing SMS to Create a Management Information Format File at Deployment Time
- Deploying Windows Installer Setup Packages with Systems Management Server 2.0
- Creating a Setup.exe File for the Package and Transform
- Additional Setup.ini Parameters

Copying the Installation to a Network Location

Task To copy your installation to a Network location during packaging:

1. From the checklist, select Package, and then select Location from the second column. The Location View of the Package View opens.
2. Select the Network Location option button.
3. Specify the network location, or click Browse to locate it.

When you create your package, the appropriate files will be copied to the network location you specified.

Note • If the transforms are copied to the same location as the original MSI, only the transform, setup.exe, setup.ini, and Windows Installer engines are copied.
Copying the Installation to an FTP Server

AdminStudio 2019 | Tuner

**Task**

*To copy your installation to an FTP server during packaging:*

1. From the checklist, select Package, and then select Location from the second column. The Location View of the Package View opens.

2. Select the FTP Server option button.

3. Specify the FTP server name (FTP Location), the UserName, and Password for the FTP server.

When you create your package, the appropriate files will be copied to the FTP server you specified.

Creating a Package Definition File (PDF)

AdminStudio 2019 | Tuner

**Task**

*To create a Package Definition File (PDF):*

1. From the checklist, select Package, and then select SMS from the second column. The SMS View of the Package View opens.

2. Select the Create Package Definition File check box.

When you create your package, the resulting file has a .PDF extension. Here is a sample ORCA.PDF file:

```
[PDF]
Version=1.0

[Package Definition]
Product=Orca
Version=1.20.1827.1
Comment=Microsoft
SetupVariations=Typical, Automated

[Typical Setup]
CommandLine = msiexec /i Orca.msi
UserInputRequired = TRUE
SynchronousSystemExitRequired = TRUE
SupportedPlatforms = Win 9x, Win NT (i386)

[Automated Setup]
CommandLine = msiexec /i /q Orca.msi
UserInputRequired = FALSE
SynchronousSystemExitRequired = TRUE
SupportedPlatforms = Win 9x, Win NT (i386)

[Setup Package for Inventory]
InventoryThisPackage=FALSE
```
Creating an SMS File

AdminStudio 2019 | Tuner

**Task**

**To create a SMS file for SMS 2.0 or later:**

1. From the checklist, select Package, and then select SMS from the second column. The SMS View of the Package View opens.

2. Select the Create SMS file check box.

When you create your package, the resulting file has an .SMS extension. Here is a sample ORCA.SMS file:

```
[PDF]
Version=2.0

[Package Definition]
MIFilename=Sample.MIF
Name=Orca
Publisher=Microsoft
Version=1.20.1827.1
Language=English
Programs=Typical, Automated, Test

[Typical]
Name = Typical
CommandLine = msiexec /i Orca.msi
UserInputRequired = TRUE
UninstallKey={8FC71000-88A0-4B41-82B8-8905D4AA904C}
AfterRunning=ProgramRestart
SupportedClients = Win 9x, Win NT (i386)

[Automated]
Name = Automated
CommandLine = msiexec /i /q Orca.msi
UserInputRequired = FALSE
UninstallKey={8FC71000-88A0-4B41-82B8-8905D4AA904C}
AfterRunning=ProgramRestart
SupportedClients = Win 9x, Win NT (i386)

[Test]
Name = Test
CommandLine = msiexec /i Orca.msi EXECUTEMODE=None
UserInputRequired = FALSE
AfterRunning=ProgramRestart
SupportedClients = Win 9x, Win NT (i386)
```
Instructing SMS to Create a Management Information Format File at Deployment Time

AdminStudio 2019 | Tuner

Task

To instruct SMS to create a Management Information Format (MIF) file at deployment time:

1. From the checklist, select Package, and then select SMS from the second column. The SMS View of the Package View opens.
2. Select the Create SMS file check box.
3. Provide the name of the application you are installing in the Install MIF Filename field.
4. Provide the name of the application to be uninstalled in the Uninstall MIF Filename field.
5. Enter the serial number for the product in the Serial Number field.

The resulting file has a .MIF extension.

Deploying Windows Installer Setup Packages with Systems Management Server 2.0

AdminStudio 2019 | Tuner

Task

To deploy Windows Installer setup packages with SMS 2.0:

Perform the steps detailed in the Microsoft White Paper: Deploying Windows Installer Setup Packages with Systems Management Server 2.0.

Creating a Setup.exe File for the Package and Transform

AdminStudio 2019 | Tuner

Task

To create a Setup.exe file to begin the installation of your base package and transform:

1. From the checklist, select Package, and then select Setup from the second column. The Setup View of the Package View opens.
2. Select the Create Installation Launcher (Setup.exe) check box.
3. Specify whether you want to include the Windows 95/98 or Windows NT MSI engines.
4. Provide any command-line arguments for your installation.
5. Save your transform. The Setup.exe file is stored in the directory specified in the Location panel of the Packaging Wizard, or in the Location view within the Package view.
Additional Setup.ini Parameters

You can modify the Setup.ini file generated by Tuner for added functionality. The following two parameters can be included in the [Startup] section of the Setup.ini:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SuppressWin2k</td>
<td>If you add this line and set its value to “Y” or “y” (SuppressWin2k=Y or SuppressWin2k=y), Setup.exe will not display a message on the target system stating that an older version of Windows Installer is installed.</td>
</tr>
<tr>
<td>SuppressReboot</td>
<td>If you add this line and set its value to “Y” or “y” (SuppressReboot=Y or SuppressReboot=y), Setup.exe will delay the reboot typically required by the installation of a newer version of Windows Installer on the target machine. If the application’s setup requires a reboot, this will occur normally.</td>
</tr>
</tbody>
</table>

Directly Editing Packages

Windows Installer packages are relational databases consisting of dozens of interrelated tables. These tables reflect the application’s features, components, relationship between features and components, registry information, and user interface.

The Direct Editor allows you to edit values in the MSI tables of the base Windows Installer package and store them in your transform. As you change values elsewhere in your transform, those changes are reflected in the Direct Editor, and vice versa. The complete list of MSI tables contained in the installation package is displayed in the left pane. When you select a table, the contents are displayed in the right pane.

Resizing Table Columns in the Direct Editor

When you initially open the Direct Editor, the selected table’s columns are listed in a compact format so that the maximum number of columns are displayed.

To automatically resize a column so that its width matches that of its longest entry, double-click on the column heading. This new column width setting is automatically saved and will be implemented the next time you view this table column in the Direct Editor.

Sorting Table Columns in the Direct Editor

To sort a table column, click the column heading once. The order will toggle between ascending and descending.

Adding a New Record Using the Direct Editor
Finding and Replacing Using the Direct Editor
Launching the Direct Editor from the Validation Tab
Adding a New Record Using the Direct Editor

To add a new record in the Direct Editor:

1. Select Direct Editor from the checklist. The Direct Editor opens.
2. Select the table you want to add a row to from the table tree.
3. Click on the last row in the table's grid, or click anywhere in the table and press the Insert key.

A new record is added to the grid using a unique key for the record (use ColumnName<n> as the template). You can then modify the record.

Caution • To ensure files are deployed on the target system, add files in the Files and Folders View, rather than to the file table. Files added to the File table are not physically added to the transform.

Finding and Replacing Using the Direct Editor

The Direct Editor supports find and replace throughout all tables. The following commands are available:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find (Ctrl+F)</td>
<td>Displays a standard Find dialog box and allows you to search for a string in all tables.</td>
</tr>
<tr>
<td>Find Next (F3)</td>
<td>Allows you to search for the next occurrence of a given string in all tables.</td>
</tr>
<tr>
<td>Replace (Ctrl+H)</td>
<td>Displays a standard Search and Replace dialog box and allows you to search for data in all the MSI tables and gives you the option to replace the data.</td>
</tr>
</tbody>
</table>

Launching the Direct Editor from the Validation Tab

When performing a Prevalidation or Postvalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error ( ), a Warning ( ), or an Informational Message ( ), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red. This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform.
Resizing Table Columns in the Direct Editor

When you initially open the Direct Editor, the selected table’s columns are listed in a compact format so that the maximum number of columns are displayed.

To automatically resize a column so that its width matches that of its longest entry, double-click on the column heading. This new column width setting is automatically saved and will be implemented the next time you view this table column in the Direct Editor.

Sorting Table Columns in the Direct Editor

To sort a table column, click the column heading once. The order will toggle between ascending and descending.

Documenting Response Transform Creation Using the Microsoft Step Recorder Tool

AdminStudio 2019 | Tuner

You can use the Microsoft Steps Recorder documentation tool with Tuner to automatically record the step-by-step actions that occur during response transform creation. This information, which is saved in a web archive (.mht) file, includes a text description of where you clicked on each screen, along with a screen capture for each click.

To enable this option, select the Run Microsoft Step Recorder to document transform creation steps so they can be reviewed later option on the Tuner Create a New Transform view.

Task
To use the Microsoft Steps Recorder during transform creation:

1. Launch Tuner.
2. Open the Create a New Transform view.
3. Next to the Select an MSI file field, click Browse and select the Windows Installer package that you want to create a response transform for.
4. Select the Response Transform option.
5. Select the Run Microsoft Step Recorder to document transform creation steps so they can be reviewed later option.
6. Click Create. The installer is launched.
7. Click through the installer, making the selections that you want to record in the response transform, as described in Creating New Transform Files.
8. When the response transform has been created, open the directory containing the transform file, and locate the following web archive (.mht) file:

   InstallerName_Recording_YYYYMMDD_TIME.mht

   For example:
QuickTime_Recording_20150409_1015.mht

9. Double-click the file to open it. The file opens in a browser window.

10. In the **Steps** section, scroll down to view all of the steps that you performed during transform creation along with screen captures of each step.

*Tip* - If you want to view all of the screens as a slide show instead of scrolling through them, click **Review the recorded steps as a slide show**.

11. Review the information in the **Additional Details** area, which contains a text description of the steps that were taken, along with information that is internal to the application for which a transform was created.
Tuner Reference

Reference information for Tuner is divided into the following sections:

Table 14-5 • Tuner Reference Sections

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Interface Reference</td>
<td>Contains general information about the Tuner user interface, including menus, toolbars, keyboard shortcuts, windows, and dialog boxes.</td>
</tr>
<tr>
<td>Tuner Views</td>
<td>Contains detailed reference information about each Tuner view.</td>
</tr>
<tr>
<td>Import INI File Wizard</td>
<td>Provides reference information for the Import INI File Wizard. This is the same information accessible by clicking Help in the Wizard.</td>
</tr>
</tbody>
</table>
User Interface Reference

This book describes the user interface components, such as menu items, the toolbar, views, and dialog boxes you will encounter throughout Tuner.

- **Menus and Toolbar**
- **View Bar**
- **Checklist**
- **Output Window**
- **Customize Dialog Box**
- **Properties Dialog Box**

These topics are the same detailed documentation that is displayed when you press the F1 key or click the Help button while working in a dialog.

Menus and Toolbar

The Tuner user interface has several menus, each of which contain different commands. The functionality of each command is described below. Additionally, the Toolbar provides quick access to some of the frequently used commands; the corresponding toolbar buttons are listed with the appropriate commands.

<table>
<thead>
<tr>
<th>Menu</th>

View Bar

AdminStudio 2019 | Tuner

The View Bar, when visible, is located at the far left of the user interface. It provides quick shortcuts to important areas of Tuner, and can be toggled on and off using the View Bar command under the View menu, or from the corresponding toolbar button.

There are three different View Bars available:

**InstallShield**

This View Bar gives you quick access to the Tuner Start Page and the Help view.

**Checklist Steps**

This View Bar provides access to each of the checklist steps, which include Package Validation, Organization, System Configuration, Application Configuration, Package Preparation, and Additional Tools views.

**Views**

This View Bar gives you quick access to each view in Tuner.

Checklist

AdminStudio 2019 | Tuner

The checklist is a graphical tree that shows you all of the views available in Tuner, as well as their association with other views. When you select a view, it appears in the pane to the right of the checklist; you can then customize the part of the Windows Installer package pertaining to that view. The Customization Steps Checklist is a subset of the entire checklist.

The checklist can be toggled from the View menu and from the Toolbar.
Customization Steps Checklist

AdminStudio 2019 | Tuner

To assist you with your customization, Tuner provides you with a set of steps that cover all parts of the MSI file that can be customized in your transform project. You do not have to follow these steps in sequential order, or even complete all the steps. Below is a brief description of each step, and how they fit into the customization workflow.

Table 14-7 • Customization Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prevalidation View</td>
<td>This step allows you to pre-check the base Windows Installer package to ensure it is valid according to MSI standards before you take the time to create the transform file. If it is invalid, there may be unexpected results with your installation. Tuner allows you to copy the results of the prevalidation to the clipboard, where you can paste them into a message to the application’s vendor. This is one of the most important steps in the Tuner workflow. Without it, all of your work might be wasted.</td>
</tr>
<tr>
<td>Organization View</td>
<td>This allows you to specify both the default destination that the installation will suggest, as well as the suggested default company name. You also can modify some properties of individual features in the product.</td>
</tr>
<tr>
<td>System Configuration View</td>
<td>This is where Tuner shows you its true customization power. You can add files and registry entries to the installation, allowing you to add company-specific files, templates, etc. to the installation. For example, if you have a set of word processing templates your company uses, you can include them you can modify or remove existing shortcuts, or add your own as necessary.</td>
</tr>
<tr>
<td>Application Configuration View</td>
<td>This step allows you to change functionality for Add/Remove Programs in Control Panel for Windows 2000 and later. You can also see the full spectrum of MSI properties as they exist in the base Windows Installer package, and add, modify, or remove them as necessary. Additionally, you can configure source resiliency through the Server Locations view, and customize user interface sequences through the Dialogs view.</td>
</tr>
<tr>
<td>Package Preparation View</td>
<td>This step allows you to postvalidate your project, verifying the original Windows Installer package and transform file, meets MSI-validation standards. You also can select the distribution options, including ones for network, FTP, single-executable, and SMS distributions.</td>
</tr>
</tbody>
</table>

Output Window

AdminStudio 2019 | Tuner

When you prevalidate the base Windows Installer package, postvalidate the package and your transform, or package the transform and base package, the Output Window appears at the bottom of the interface. It consists of three tabs:

- **Output**—Lists the Errors ( משהו unseen), Warnings ( משהו unseen), and Informational Messages ( משהו unseen) that are generated during prevalidation, postvalidation, and packaging.
- **Validation**—Upon completion of the pre- or postvalidation, this tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate...
whether it is an Error ( ), a Warning ( ), or an Informational Message ( ), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row's associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red. You can then use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform.

- **Packaging**—Displays packaging/distribution information, and displays a summary of the files copied. You can copy these results to the clipboard by right-clicking and selecting Copy.

The Output Window can be toggled from the View menu.

### Customize Dialog Box

**AdminStudio 2019 | Tuner**

The Customize Dialog box allows you to customize which toolbars are available in the Tuner user interface, as well as the buttons that are available on the toolbars. The dialog box consists of two tab panels:

- **Toolbars**

  From the Toolbars panel, you can select viewing properties for all toolbars, such as whether tooltips are displayed, the style of the toolbar, and the size of the buttons. You can also create your own custom toolbar, onto which you can place buttons found in the Command tab panel.

- **Command**

  The Command panel allows you to customize toolbars and the menu bar. Simply drag the command or menu you want to add to the existing toolbar; it appears where you place it. To remove a command or menu, select it and drag it off the toolbar.

### Properties Dialog Box

**AdminStudio 2019 | Tuner**

This dialog box displays properties of the transform you are currently creating or editing—including the name and location of the base Windows Installer file, and any additional transforms that are associated with this transform and MSI file.

### Options Dialog Box

**AdminStudio 2019 | Tuner**

The Options dialog box has two tabs: File Locations and View Settings.

- **File Locations**

  Within the File Locations tab, you can specify the default location of your source MSI files. This is reflected in the New Transform and Open Existing Transform Views of the Tuner Start Page.
View Settings
From the View Settings tab, you can select whether you want to display files from the base Windows Installer package (MSI) in the Files and Folders view in addition to files added in the transform.

Transform Summary Dialog Box
The Transform Summary dialog box, available from the Project menu, allows you to configure how to handle specific errors when the transform is applied. Additionally, you can configure how the Windows Installer Service verifies whether the transform can be applied against a given package.

Suppression Options
Options in this section allow you to configure whether installations with this transform applied will continue or fail if certain errors are encountered. You can configure the following options:

Table 14-8 • Suppression Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Existing Row</td>
<td>Suppresses errors resulting from adding rows that already exist.</td>
</tr>
<tr>
<td>Delete Missing Row</td>
<td>Suppresses errors resulting from deleting rows that do not exist.</td>
</tr>
<tr>
<td>Add Existing Table</td>
<td>Suppresses errors resulting from adding existing tables.</td>
</tr>
<tr>
<td>Delete Missing Table</td>
<td>Suppresses errors resulting from deleting tables that do not exist.</td>
</tr>
<tr>
<td>Modify Missing Row</td>
<td>Suppresses errors resulting from updating rows that do not exist.</td>
</tr>
<tr>
<td>Change Code Page</td>
<td>Suppresses errors resulting from mismatched code pages.</td>
</tr>
</tbody>
</table>

Validation Options
Options in this section allow you to specify how the Windows Installer Service verifies the transform can be applied to a Windows Installer package. You can configure the following options:

Table 14-9 • Validation Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same Language</td>
<td>If selected, the package against which the transform is applied must be the same language as the package used to create the transform.</td>
</tr>
<tr>
<td>Same Product Code</td>
<td>If selected, the product code for the package against which the transform is to be applied must be the same as the package product code of the package used to create the transform. If not selected, you can create a generic transform that can be applied against multiple Windows Installer packages.</td>
</tr>
</tbody>
</table>
You can use the Dialog Properties dialog box to view or change properties associated with UI sequence dialogs. The Dialog Properties dialog box is accessible by either selecting the appropriate dialog in the sequence and clicking Properties, or if you attempt to hide a dialog which has properties that must be configured.

Table 14-9 • Validation Options (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same Upgrade Code</td>
<td>If selected, the upgrade code of the package against which the transform is applied must be the same as the upgrade code of the package used to create the transform.</td>
</tr>
<tr>
<td>Product Version is Lower</td>
<td>If selected, the product version must be less than the version of the package used to create the transform. This can be combined with the Product Version is Equal option to create a “less than or equal to” comparison.</td>
</tr>
<tr>
<td>Product Version is Equal</td>
<td>If selected, the product version must be equal to the version of the package used to create the transform. This can also be combined with either the Product Version is Lower option or the Product Version is Higher option, creating a “less than or equal to” or “greater than or equal to” comparison.</td>
</tr>
<tr>
<td>Product Version is Higher</td>
<td>If selected, the product version must be greater than the version of the package used to create the transform. This can be combined with the Product Version is Equal option to create a “greater than or equal to” comparison.</td>
</tr>
<tr>
<td>Version Checking</td>
<td>When using product version comparisons, you must indicate to what degree you want the comparison made. You can compare only the major versions, the major and minor versions, or the major, minor, and update versions. You can also select None to clear version checking.</td>
</tr>
</tbody>
</table>
Note • You must ascertain the purpose of each property from the Windows Installer package, as these properties are usually custom in nature. This is especially true for properties that must be set prior to hiding a dialog from the UI sequence.

Null Properties

You cannot hide UI sequence dialogs until you provide values for all currently null properties. These values are necessary to establish a new dialog display sequence. Each property which must be configured prior to hiding the dialog in the sequence is marked with . Either configure the null properties, or click Cancel to return to the Dialogs view. Typically, configuring a null property involves clicking in the property’s value field and selecting the value from the drop-down list.

Once you have provided a value for a null property, or if the property does not require configuration, it is denoted with .

Tuner Views

Tuner Start Page

From the Tuner Start Page, you can create a new transform project or open an existing one.

Select one of the following links for more information:

Table 14-11 • Tuner Start Page Subviews

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Welcome to Tuner View</td>
<td>General information about Tuner.</td>
</tr>
<tr>
<td>Create a New Transform View</td>
<td>Create a new customization, either starting with a blank transform, or by using a Response Transform based on selections from a custom installation.</td>
</tr>
<tr>
<td>Open a Recent Transform View</td>
<td>Select a transform previously created with Tuner.</td>
</tr>
</tbody>
</table>
**Welcome to Tuner View**

The Welcome view provides you with links to information on the Windows Installer service, Microsoft’s integrated method of handling installations, as well as information about Tuner in the form of checklist steps. These steps cover the customization capabilities of Tuner.

**Create a New Transform View**

This view is displayed when you click **Create a new transform** or select **New** from the **File** menu.

This view contains the following options:

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open an Existing Transform View</td>
<td>Select a transform created with a tool other than Tuner. You need to provide additional information, such as the base Windows Installer package for this transform.</td>
</tr>
</tbody>
</table>
## Base Windows Installer Package Subview

### Table 14-12 • Base Windows Installer Package Subview

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select an MSI file</td>
<td>Enter the name and location of the Windows Installer package that you are customizing, or click Browse to locate it.</td>
</tr>
</tbody>
</table>
| Provide a list of additional transforms to be applied | If there are transforms already associated with the Windows Installer package, (for example, previous customizations or transforms containing language-specific information), click the New button ( ).  
When an entry appears in the list, click the Browse button (…) to the right of it and locate the transform.  
If multiple transforms are associated with this package, use the Move Up ( ) and Move Down ( ) buttons to specify the order in which the transforms are applied. |

**Caution** • When using multiple transforms, keep in mind that the order in which they are applied is critical. For example, if you create a transform for a Windows Installer package that creates a new value for a property, and then create a second transform that changes the value created in the first transform, everything works correctly. However, if you apply the second transform first, that transform is attempting to modify the property’s value, instead of creating it. That will result in an error.

One simple example of where this may be a problem is with the default company name. If the value is not set by default, and you set it in using the first transform, a new value for the property is created. If you create a second transform that modifies the combined original package and first transform, and the second transform changes the default company name, it is only changing the property. However, if you try to apply the second transform without the first one, Windows Installer interprets this as trying to change a null value to another value, which will result in an error.

## Windows Installer Transforms Subview

### Table 14-13 • Windows Installer Transforms Subview

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Provide a new project name and location (or accept the default) and click Create to create a new Customization project | Provide a new project name and location. By default, the transform will be created in the same directory as the Windows Installer package, and named the same as the base package with an .mst extension.  
If you want to change the name and/or location of the transform, click Browse to open the Save Customization File dialog. Navigate to the directory in which you want to store the transform file you are creating. Provide the name of the transform with an .mst extension (for example, MyTransform.mst) and click Save. The dialog box closes and the path and file name appear in the edit field. |
Table 14-13 • Windows Installer Transforms Subview

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Response Transform</strong></td>
<td>If you want to create a Response Transform, select this check box.</td>
</tr>
<tr>
<td></td>
<td>If creating a Response Transform, step through the installation, making changes as necessary. When you reach the end of the installation sequence and click Install, the installation will exit and the Tuner interface will open your transform, which contains all of the changes you made during the simulated installation.</td>
</tr>
<tr>
<td><strong>Command line properties</strong></td>
<td>If you are using a response transform, you can specify additional command-line properties (in property name/value pairs separated by semicolons) to pass to the response transform. These must be PUBLIC properties, and only control how the dialogs are displayed during creation of the response transform. They are not persisted outside of the UI sequence during creation. For example, you can pass the property/value pair ARPHELPTELEPHONE=1-111-111-1111 to set the value of the Help Telephone field of Add/Remove Programs. You might pass a property/value pair during response transform creation to display all dialogs during an installation that may not be displayed based on your system configuration (for example, to show Windows 9x-only dialogs on a Windows NT platform). You can then make appropriate responses and have them included in your transform.</td>
</tr>
<tr>
<td><strong>Run Microsoft Step Recorder to document response transform creation steps so that they can be reviewed later</strong></td>
<td>Select this option to record the response transform creation steps in a document using the Microsoft Step Recorder. For more information, see Documenting Response Transform Creation Using the Microsoft Step Recorder Tool.</td>
</tr>
</tbody>
</table>

You can access information about the original MSI file and associated transforms by selecting Properties from the File menu.

Open a Recent Transform View

AdminStudio 2019 | Tuner

This view, a list containing your most recently accessed transforms, is displayed when you click on Open a recent transform. Select a transform and click Open to open it, or select Properties from the shortcut menu to view information about it (including details about the base MSI package and associated transforms).

You can also select one of the options at the bottom of the view to determine the view that is opened when you start up Tuner:

- load the last accessed transform when opening Tuner,
- make this recent list the default Tuner Start Page screen, or
- make the Welcome screen the default Tuner Start Page screen
Open an Existing Transform View

AdminStudio 2019 | Tuner

This view is displayed when you click on Open an existing transform or select File | Open. On this view, you can specify the name and location of the base Windows Installer package, any associated transforms, and the name and location of the transform file.

Generally, you will only use this option when opening existing transforms that were created by a product other than Tuner, or created by someone other than yourself. Transforms you create using Tuner are more easily accessed through using the Open a recent transform selection.

Help View

AdminStudio 2019 | Tuner

The Help view provides you instant access to this online help library. You can also access Microsoft’s comprehensive Windows Installer reference library.

Package Validation View

AdminStudio 2019 | Tuner

The first recommended step in creating a transform is to perform validation on the base Windows Installer package. This helps you identify potential problems that you may or may not want to correct using Tuner.

Package validation is performed in the Prevalidation View. To continue, click Prevalidation under Package Validation in the checklist.

Prevalidation View

AdminStudio 2019 | Tuner

The Prevalidation view provides you a way to ensure the base Windows Installer package for your transform is valid. If it fails the validation test, then unexpected (and unwanted) results can occur during installation.

To begin the prevalidation process, select the evaluation file that you want to use for package validation (or click Browse to locate it), and click Start. By default, the file is evaluated using the full logo-compliant validation file, and all internal consistency evaluators (ICEs) are checked. If you just want to test specific ICEs, after you select the evaluation file, specify the ICE names, and separate them by semicolons if there is more than one.

You can toggle the information level of the displayed results by checking the Show Info Messages, Show Error Messages, and Show Warning Messages check boxes. If any errors are present, the Windows Installer Package is invalid. Warning messages highlight potential problems, but will not cause validation to fail. Informational messages display ongoing information during the validation process.

Viewing the Prevalidation Results

As each ICE is run, Errors, Warnings, and Info messages are generated, and are listed in the Output tab at the bottom of the interface.
Upon completion of the Prevalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error (⚠️), a Warning (⚠️), or an Informational Message (ℹ️), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red.

This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform. For more information, see Direct Editor.

*Note* • If no errors appear in the results (providing you are displaying errors), then the package is valid against the specific ICEs you specified, or against the entire evaluation file (if no ICEs were selected).

### Organization View

**AdminStudio 2019 | Tuner**

The Organization view allows you to modify two main parts of the installation that your end users will see: the default path and default company name, and the actual features that can, will, or will not be installed.

Each subview of the Organization View is described below:

**Table 14-14 • Organization View Subviews**

<table>
<thead>
<tr>
<th>Views</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Product Properties View</strong></td>
<td>When a user runs a custom installation of a Windows Installer package, the Custom Setup dialog box provides a default installation path and a default organization name. The Product Properties view provides a mechanism for changing these defaults.</td>
</tr>
<tr>
<td><strong>Features View</strong></td>
<td>Features are the building blocks of the installation. They represent distinct pieces of functionality to end users, such as program files, help files, or clip art. You can modify which features and subfeatures are installed, and how they are installed, in the Features view.</td>
</tr>
</tbody>
</table>

### Product Properties View

**AdminStudio 2019 | Tuner**

This view gives you a way to specify the default path on the user’s computer into which the application will be installed. You can also specify the default organization name (i.e., your company’s name).

The following properties are associated with this view:
Default Destination Variable

This is the name of the variable that stores the Default Destination Path. If you change this variable, you could create errors during postvalidation. Click on the variable’s value to display a combo box that allows you to select a variable.

Generally, the variable used will be INSTALLDIR or INSTALLLOCATION (both author-created variables). However, another variable can appear as the value: TARGETDIR (a Windows Installer variable). If TARGETDIR is suggested, it is strongly recommended you contact the vendor who created the original MSI and ask what was used for the Default Destination Variable. While it is possible that it was TARGETDIR, it is also possible another variable was used and Tuner cannot identify this non-standard variable.

If the incorrect variable is set here, and/or if the Default Destination Path is changed, the installation may not function properly. If that happens, you can reset the information in this view by clicking on the Reset button when the Default Destination Variable is selected.

More information can be found in the Windows Installer Help.

Default Destination Path

This location, stored within the Default Destination Variable, is the path where the application will be installed on the target machine, unless overridden during installation from the Custom Setup dialog. Click on the path’s value to display a combo box of possible paths, or edit the path in the value field. It can be a hard-coded path, or it can be a Windows Installer folder property. Further levels can be separated with a backslash—for example, ProgramFilesFolder\MyApp\Bin.

To comply with Windows logo requirements, the application must default to a subfolder of ProgramFilesFolder, which can vary depending on the system’s locale and user settings. If ProgramFilesFolder\ProductName, is specified as the default value for the Destination Folder property, then this product’s files will always be installed to the logo-compliant location.

Company Name

This is the name the installation suggests for your organization during setup. If it is not set, the installer will automatically set it during installation using values from the registry. Once the value has been entered for the name of the organization, the COMPANYNAME property can be seen in the Setup Properties View.

Setting the Default Destination
Setting the Default Organization
Changing the Destination Variable

Features View

This view allows you to change Feature properties to best suit your situation.

Features are the building blocks of an installation from an end user’s perspective. They represent a specific capability of the product, such as the help files or a part of a product suite that can be installed or uninstalled based on the end user’s selections. Features can be composed of subfeatures, which in turn can be composed of further subfeatures. Depending on the visibility of the “parent” feature, end users can select which portions of a feature to install in the Custom Setup dialog.
Each feature and subfeature has properties that can be modified within Tuner. These include a description of each feature (as it appears in the Custom Setup dialog box), its visibility, and its initial state. Tuner allows you to change these feature properties to best suit your situation. For example, you may want to prevent a specific application within a suite from being installed in a particular transform file. By changing its initial state and visibility, you can prevent your end user from ever seeing this feature during installation.

The Features View contains the following options:

Table 14-15 • Features View Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This description will be displayed when this feature is clicked in the Custom Setup dialog box during installation.</td>
</tr>
<tr>
<td>Visible</td>
<td>Specifies how the feature will be presented to the end user during installation in the Custom Setup dialog. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• Visible and Collapsed—This feature will be displayed in the Custom Setup dialog with its subfeatures collapsed by default.</td>
</tr>
<tr>
<td></td>
<td>• Visible and Expanded—This feature will be displayed in the Custom Setup dialog with its subfeatures expanded by default.</td>
</tr>
<tr>
<td></td>
<td>• Not Visible—This feature will not be displayed to the end user in the Custom Setup dialog. Although an end user obviously cannot select or deselect an invisible feature, this property does not affect whether a feature is installed. In other words, a feature is not automatically installed if it is invisible; it just cannot be deselected if it would otherwise be installed, or selected if it should not be installed.</td>
</tr>
<tr>
<td>Initial State</td>
<td>Provide the initial state for the feature. The end user can override this from the Custom Setup dialog. Your options are:</td>
</tr>
<tr>
<td></td>
<td>• The feature is not installed—By default, the feature will not be installed during setup.</td>
</tr>
<tr>
<td></td>
<td>• The feature is installed on the local drive—By default, the feature will be installed on the local drive during setup.</td>
</tr>
<tr>
<td></td>
<td>• The feature is run from source, CD, or network—By default, the feature will be run from the source, whether it be from the installation CD or from the network.</td>
</tr>
<tr>
<td></td>
<td>• The feature is advertised—By default, the feature will be advertised, but not installed. Essentially, this is an on-demand option; a shortcut will be created during setup, and if the shortcut is clicked, the feature will then be installed from the source. This ensures features that may be unnecessary are not installed until they are needed, if ever.</td>
</tr>
</tbody>
</table>

**System Configuration View**

The System Configuration view provides you with the ability to add additional files to a Windows Installer installation package, as well as add, remove, or modify shortcuts and registry information. Ultimately, this allows you to customize the installation to your needs, such as including company-specific templates in the correct folder during installation.

**Files and Folders View**

The Files and Folders View consists of four panes, representing the Source and Destination views.

**Source Computer View**

The Source view, located at the top, displays the folder and file structure on the user’s computer.

**Destination Computer View**

The Destination computer’s folders pane represents the folders on the target machine for the installation. The folders initially displayed for the target machine are ones used commonly in installations.

The Destination computer’s files pane displays the files that are part of the installation. Initially, only files contained in the base Windows Installer package are displayed. When you add files to the package (into the transform), these also appear in this pane.

*Note* • Tuner cannot display files contained within compressed files.

A key file is a file that the Windows Installer uses to detect a component’s presence. If the key file is in its proper location, the installer assumes that the entire component is installed correctly. Each component can have a key file, represented in the Files and Folders View by a key icon (_key). The key files were set by the setup author, and cannot be modified using Tuner.

**Destination Computer View Tasks**

The following tasks are performed in the Destination Computer View:

- **Defining a New Folder**—To define a new folder, right-click on either the Destination Computer or a predefined folder from the Destination Computer’s Folders pane and select Add from the shortcut menu.

- **Adding Files to an Installation**—To add files to an installation, simply locate them within the Source view, and either drag and drop them to the appropriate destination folder, or use the copy and paste commands.

- **Removing Folders or Files**—To remove folders and files you have already added to the installation, right-click on the file or folder from the Destination view and select Delete from the shortcut menu. Predefined folders are required for installation and cannot be removed. If you add files to an installation, they are always installed.

- **Removing Files from the Base Windows Installer Package**—Files from the base Windows Installer package can be removed during installation, except for key files. To remove a non-key file from the MSI, right-click on the file and select Remove from the shortcut menu. The file is marked with an icon indicating it is not to be installed during installation.

Registry View

AdminStudio 2019 | Tuner

Similar to the Files and Folders View, the Registry view consists of four panes representing the Source and Destination views.

Source Computer View

The Source view, located at the top, displays the registry entries on the administrator’s computer.

Destination Computer View

The Destination view represents the registry entries on the target machine for the installation. By default, the Destination view contains the following read-only registry hives: HKEY_CLASSES_ROOT, HKEY_CURRENT_USER, HKEY_LOCAL_MACHINE, HKEY_USERS, and HKEY_USER_SELECTABLE.

You can use the Registry view to:

- Create registry keys and values. You can do this using the same procedure you use to create registry keys and values in the Windows Registry Editor, or you can copy or drag and drop existing keys and values from the Source view to the Destination view.
- Import an existing REG file using the Import REG File Wizard.
- Modify or delete registry keys that are part of the base installation. If you add new registry keys, they will always be installed.

Setting Registry Key Options

You must be cautious when creating new registry keys so adverse results do not occur. You must specify whether the key is to be created at install, removed at uninstall, or both. These mutually exclusive options are available by right-clicking on a key.

Table 14-16 • Registry Key Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Key at Install</td>
<td>Creates the new registry key during installation if the key does not exist on the target machine.</td>
</tr>
<tr>
<td>Delete Key at Uninstall</td>
<td>Deletes the registry key during uninstallation, regardless of whether the key existed prior to the MSI’s installation. This means that the key, and all its contents and sub-keys, will be removed regardless of whether other software information that is unrelated to this MSI exists. This can have a severe impact on other programs; only select this option if you are sure that the only software affected is the base MSI.</td>
</tr>
</tbody>
</table>
Shortcuts View

The Shortcuts view offers an integrated, visual method for adding shortcuts and program folders to the installation. Existing shortcuts can also be modified or removed. For information on how to use the Shortcuts view to create, edit, or remove shortcuts, refer to one of the following topics:

- **Shortcut Properties**—Explains the Properties that you set when creating a shortcut.
- **Shortcut Locations**—Explains how to specify the location of a shortcut, either in a predefined folder or a folder that you create.
- **Shortcut Targets**—Explains how to specify the path to the shortcut’s target application, batch file, folder, or feature.

Note • Shortcuts created in the transform are denoted by \( \square \) and shortcuts from the base Windows Installer package are denoted by \( \triangle \).

Shortcuts View/Shortcut Properties

When creating or editing a shortcut, you specify properties on the Shortcut Properties View.

The Shortcut Properties are described in the following table:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon</td>
<td>Displays the name of the icon for this shortcut.</td>
</tr>
<tr>
<td></td>
<td>• <strong>To change the icon</strong>, click the Change Icon button. On the Change Icon dialog box, click Browse to select an EXE file or DLL. All of the icons contained in that EXE or DLL file are displayed. Select the appropriate icon and click OK. On the Shortcut Properties view, the name of the icon now appears in the icon value cell and a picture of the icon appears next to the Change Icon button.</td>
</tr>
<tr>
<td></td>
<td>• <strong>To remove the icon</strong>, click Clear Icon.</td>
</tr>
</tbody>
</table>
### Shortcut Properties (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>A brief description of the shortcut. The text in this field will appear when users hover the mouse pointer over the shortcut in Windows 2000 or later.</td>
</tr>
<tr>
<td><strong>Arguments</strong></td>
<td>Any command-line arguments for the shortcut.</td>
</tr>
<tr>
<td><strong>Target Type</strong></td>
<td>The destination folder, or a file from the MSI or transform. This property can be set to one of the following values:</td>
</tr>
<tr>
<td>● <strong>File from MSI Package</strong></td>
<td>Used if the shortcut is to a file that is part of the base Windows Installer package.</td>
</tr>
<tr>
<td>● <strong>File from System</strong></td>
<td>Used if the shortcut is to a file that already exists on the target system. It may also be from the transform file.</td>
</tr>
<tr>
<td>● <strong>Destination Folder</strong></td>
<td>Used if the shortcut points to a folder rather than a file. The folder can be on the target system, from the MSI package, or from the transform.</td>
</tr>
<tr>
<td>● <strong>Advertised shortcut</strong></td>
<td>Used if you want this to be a shortcut to an “advertised” feature. Advertised features are not installed immediately during the setup process. Instead, they are installed when requested. The shortcut makes it appear that the feature is already installed, although it is not installed until the end user requests it.</td>
</tr>
<tr>
<td><strong>Target</strong></td>
<td>Path and file name for this shortcut’s target. There are many potential types of targets, including applications, files, folders, printers, and computers on a network. Instead of hard-coding a path, you can use a Windows Installer folder property in square brackets—for example, <code>[INSTALLDIR]\MyApp.exe</code>. You can also target Windows Installer features, which you can use for feature advertisement.</td>
</tr>
<tr>
<td>To specify a feature as a shortcut target, enter the name of the feature in the Target field. You can determine the name of the feature by going to the MSI Table Editor and selecting the Feature table. The list of features you can target with your shortcut is listed in the Features column of the table.</td>
<td></td>
</tr>
<tr>
<td><strong>Run</strong></td>
<td>Specifies how the item is displayed when the shortcut is double-clicked. You can select from the following options:</td>
</tr>
<tr>
<td>● <strong>Normal Window</strong></td>
<td>Launches the program in a normal sized window.</td>
</tr>
<tr>
<td>● <strong>Maximized Window</strong></td>
<td>Launches the program in full-screen view.</td>
</tr>
<tr>
<td>● <strong>Minimized Window</strong></td>
<td>Launches the program in a minimized window, visible only on the taskbar.</td>
</tr>
<tr>
<td><strong>Working Directory</strong></td>
<td>Default directory for the Save As and Open dialogs. If you are modifying an existing shortcut, or creating a new one, you can select a Windows Installer folder property from the list instead of hard-coding a path. Separate further levels with a backslash—for example, <code>&lt;ProgramFilesFolders&gt;\MyApp\Bin</code>.</td>
</tr>
</tbody>
</table>
Chapter 14  Customizing Installations Using Tuner
Tuner Reference

There are four shortcut Target Types you can add to a transform:

**Table 14-18 • Shortcut Target Types**

<table>
<thead>
<tr>
<th>Target Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File from MSI Package</td>
<td>Used if the shortcut’s target is a file that is part of the base Windows Installer package.</td>
</tr>
<tr>
<td>File from File System</td>
<td>Used if the shortcut’s target is a file already existing on the target system.</td>
</tr>
<tr>
<td>Advertised Shortcut</td>
<td>Used if you want this to be a shortcut to an &quot;advertised&quot; feature. Advertised features are not installed immediately during the setup process. Instead, they are installed when requested. The shortcut makes it appear that the feature is already installed, although it is not installed until the end user requests it.</td>
</tr>
<tr>
<td>Destination Folder</td>
<td>Used if the shortcut points to a folder rather than a file.</td>
</tr>
</tbody>
</table>

The Target Type that is selected affects what you should enter in the Target property field:

**File from MSI Package & File from File System**

Under most circumstances, shortcut targets are applications or batch files. You simply provide the full path to the application or batch file in the Target property. However, after entering the target, if you leave the Shortcuts view and then return to it, you find that the target has changed. For example, you might have entered `C:\Temp\MyFolder\mytarget.exe` as the target, but it now reads `[MyFolder]\mytarget.exe`. What has happened is that the path has been replaced based on entries made to the Directory table. For more information, see Determining the Path of Changed Shortcuts.

By stringing together the directories you just located in the Directory table, you can determine the path represented by `[MyFolder]` in the shortcut target. If you use the drop-down list in the Target property, you can determine the absolute values of these other directories in the same fashion.

**Caution** • Microsoft recommends that you do not set this value, as it may conflict with existing hot key combinations on the target machine.
**Destination Folder**

To point the shortcut to a folder rather than a file, select Destination Folder in the Target Type property, and then select a folder name from the Target property drop-down list. The Target list includes available folders on the target system, from the MSI package, and from the transform.

**Advertised Shortcut**

You can also target Windows Installer features, which you can use for feature advertisement. To specify a feature as a shortcut target, simply enter the feature name in the Target field. You can determine the name of the feature by going to the Direct Editor and selecting the Feature table. The list of features that you can target is listed in the Features column of the table.

*See Also*

Determining the Path of Changed Shortcuts

**Shortcuts View/Shortcut Locations**

When you first navigate to the Shortcuts view, you see a set of predefined folders with existing shortcuts (if the base MSI package had shortcuts defined). You can modify or remove these shortcuts according to your needs.

If you need to create your own shortcut, you can place it in a new folder you define or in a predefined folder. Additional predefined folders that are not displayed can be accessed by right-clicking on the uppermost item in the Shortcuts explorer and selecting Show Folder.

Under the Show Folder submenu is a list of the additional predefined folders supported in the Shortcuts view. Select the folder where you want your shortcut created to have it displayed in the Shortcuts explorer. The predefined shortcut destinations are described below.

Alternately, you can create your own folder in which to place shortcuts by right-clicking either a folder or the top level Shortcuts item and selecting New Folder. To remove a folder that you have added, right-click on it and select Delete.

The following predefined folders are available for shortcuts:

**Table 14-19 • Predefined Shortcut Folders**

<table>
<thead>
<tr>
<th>Predefined Folder Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AppDataFolder</td>
<td>The current user’s Application Data folder.</td>
</tr>
<tr>
<td>CommonFilesFolder</td>
<td>The Common Files folder for the current user.</td>
</tr>
<tr>
<td>DesktopFolder</td>
<td>The user’s desktop. Although placing a shortcut on the desktop makes it easily visible, it can also be distracting to users, so it should be used sparingly.</td>
</tr>
<tr>
<td>FavoritesFolder</td>
<td>The Favorites folder for the current user.</td>
</tr>
<tr>
<td>FontsFolder</td>
<td>References the target machine’s Fonts folder.</td>
</tr>
<tr>
<td>INSTALLDIR</td>
<td>The installation’s default destination folder.</td>
</tr>
</tbody>
</table>
Initialization (INI) files serve as a database in which you can store and retrieve information between uses of your application. Typically, INI Files contain key name-value pairs representing run-time options for applications. Some INI files, such as Boot.ini and Wininit.ini, are used by the operating system.

The INI Files view provides a graphical way for users to add, modify, or delete the contents of the IniFile Table.

- The INI Files view displays the contents of the IniFile table from the source Windows Installer package and the transform.
- The view itself consists of three panes: the leftmost a tree of predefined folders from the Windows Installer package and user-defined folders from the transform.
- The top-right section displays the keys and values in the selected IniFile section. Windows Installer and transform values are distinguished by different icons in this pane.
- The lower-right pane provides information about the selected key.

<table>
<thead>
<tr>
<th>Predefined Folder Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProgramFilesFolder</td>
<td>References the target machine’s Program Files folder.</td>
</tr>
<tr>
<td>ProgramMenuFolder</td>
<td>The Program menu for the current user.</td>
</tr>
<tr>
<td>SendToFolder</td>
<td>The user’s Send To folder, which is accessible when you right-click on files. Shortcuts are placed here so users can have quick access to the target program from many file types.</td>
</tr>
<tr>
<td>StartMenuFolder</td>
<td>The Start menu folder for the current user.</td>
</tr>
<tr>
<td>StartupFolder</td>
<td>The current user’s Startup folder. Shortcuts placed here automatically launch their targets whenever Windows is started.</td>
</tr>
<tr>
<td>SystemFolder</td>
<td>The target machine’s System folder.</td>
</tr>
<tr>
<td>TempFolder</td>
<td>References the target machine’s Temp folder (usually C:\Temp).</td>
</tr>
<tr>
<td>TemplateFolder</td>
<td>The current user’s Template folder.</td>
</tr>
<tr>

<td>The target machine’s Windows folder.</td>
</tr>
</tbody>
</table>
Editing INI Files in Tuner

To edit an INI File in Tuner, simply expand the appropriate IniFile node in the tree. Then select the appropriate section, which appears in the upper right pane. You can then edit the keys and values appropriately. You can also insert new keys and values by right-clicking in the key and value pane and selecting Add. If you want to add a new section to an INI File, right-click on the INI File in the tree and select New Section. You can also delete an INI File, a section of an INI File, or a key by right-clicking the appropriate node or property sheet entry and selecting Remove.

For detailed instructions on performing these tasks, click on one of the following topics:

- Adding INI Files
- Adding New Keys to INI File Sections
- Adding Sections to INI Files
- Importing Existing INI Files
- Modifying INI File Keys, Values, and Actions
- Removing INI Files
- Removing INI File Section Keys
- Removing Sections from INI Files
- System Configuration View

ODBC Resources View

Open Database Connectivity (ODBC) Resources are ones that involve interaction with databases. Tuner allows you to view existing ODBC Data Sources, ODBC Drivers, and ODBC Translators.

The left pane of the ODBC Resources view contains a tree with the three root nodes: ODBC Data Sources, ODBC Drivers, and ODBC Translators. When any of these are expanded, individual Data Sources, Drivers, and Translators contained in the Windows Installer package are displayed. When selected, each of these individual nodes displays information in a property grid displayed in the upper right pane.
There are three different types of ODBC Resources available for viewing and/or modification through the ODBC Resources view:

**Table 14-20 • ODBC Resource Types**

<table>
<thead>
<tr>
<th>Resource Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ODBC Data Sources</strong></td>
<td>The source of the data (database type) and information on how to connect to that database. Common database types include Microsoft SQL Server, Microsoft Access, and Visual FoxPro. Connection information may include the name of the database, where the server that hosts it is located, and logon/password information. You can add new ODBC Data Sources from the ones existing on your computer, or delete ones you add or existing ones from the MSI. You can also add, edit, and delete ODBC Data Source attributes. If your machine does not have the ODBC Data Source that is needed by the package, you can type it into the ODBC Data Source dialog. See <a href="#">ODBC Resources</a> and <a href="#">Adding New Data Sources</a> for more information.</td>
</tr>
<tr>
<td><strong>ODBC Drivers</strong></td>
<td>These are libraries that implement functions involving ODBC. Each database type has its own ODBC driver. You can add only those Data Sources for which ODBC Drivers exist in the MSI package. You can add, edit, or delete new attributes for ODBC Drivers, and you can edit or delete all attributes except for File, Setup File, and Feature. See <a href="#">Adding New ODBC Driver Attributes</a> and <a href="#">Editing ODBC Driver Attributes</a> for more information.</td>
</tr>
<tr>
<td><strong>ODBC Translators</strong></td>
<td>These translate one form of raw data into another form that can be used with a specific database type. For example, an ODBC translator may convert from one code package to another. You can only view the contents of an ODBC Translator and cannot add, delete or modify them.</td>
</tr>
</tbody>
</table>

**Note** • Only ODBC Data Source attributes are editable; ODBC Drivers and ODBC Translators are provided in read-only form.

**NT Services View**

The NT Services view provides a way to change parameters for NT Services included in the base Windows Installer package.

**Note** • NT services cannot be added to a setup using Tuner. You can only make modifications to services in the base Windows Installer package.
The following options can be modified:

### Table 14-21 • NT Services View Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This property contains the name of the service to install. This property may have the same value as the Display Name, but is used by the installer in a different way.</td>
</tr>
<tr>
<td>Display Name</td>
<td>The name of the service as it appears in user interfaces (such as the name used under the NT Services control panel). This string can be a maximum of 256 characters in length. It may be the same as the Name property.</td>
</tr>
<tr>
<td>Service Type</td>
<td>There are two service types available:</td>
</tr>
<tr>
<td></td>
<td>• Service that runs in its own process</td>
</tr>
<tr>
<td></td>
<td>• Service that shares a process with others</td>
</tr>
<tr>
<td>Interact with Desktop</td>
<td>Although uncommon, some services need to interact with the desktop to display message or dialog boxes for the user. If this service requires this functionality, this property’s value is set to Yes.</td>
</tr>
<tr>
<td>Start Type</td>
<td>The value in this property dictates when the service is started. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Automatic</strong>—The service starts during system startup.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Manual</strong>—The service starts when the service control manager calls the StartService function.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disabled</strong>—The service cannot be started.</td>
</tr>
<tr>
<td></td>
<td>There are two additional values, available only for driver services:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Start at boot time</strong>—The device driver is started by the operating system loader.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Started by the system</strong>—The device driver is started by calling the IoInitSystem function.</td>
</tr>
<tr>
<td>Error Control</td>
<td>This property specifies what action is taken by the startup program should the service fail to start properly during startup. The available values are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Ignore Error</strong>—Logs the error and continues startup.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Normal Error</strong>—Logs the error, displays a message box informing the user of the problem, and continues startup.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Critical Error</strong>—Logs the error, if possible, and restarts the system with the last-known-good configuration. If the last-known-good configuration caused the failure, the startup operation fails.</td>
</tr>
<tr>
<td>Overall Install</td>
<td>This property’s value specifies how the installation handles a situation when this service cannot be installed for some reason. There are two possible resolutions:</td>
</tr>
<tr>
<td></td>
<td>• Continue overall install if service fails to install</td>
</tr>

</table>
Application Configuration View

Application Configuration in Tuner involves adding or modifying properties that affect your setup as well as specifying properties for Add/Remove Programs in Control Panel for Windows 2000 and XP. You can also configure source resiliency using the Server Locations view, and customize user interface sequences from the Dialogs view.

The Windows 2000 and Add/Remove Programs in Control Panel differs from the previous Windows operating systems in many ways. Depending on how the Windows Installer setup is configured, the user has the option of removing, repairing, or changing the installation with the click of a button. Windows 2000 users are also be able to access additional information in Add/Remove Programs not available on previous platforms. With this information, it is easier for your end users to find technical support links, phone numbers, product update information, and information about your company.

Add/Remove Programs functionality can also be disabled to limit the number of end users who have access this feature.

---

<tr>
<td>Description</td>
<td>This property contains a localizable description of the service. It is typically set by the setup author.</td>
</tr>
<tr>
<td>Feature</td>
<td>This read-only property contains the name of the feature with which this service is associated.</td>
</tr>
</tbody>
</table>
Server Locations View

If you install from a network server, and if you install features to run from the server or that will be advertised for installation on their first use, the applications may need access to the server sometime after the initial installation. The applications may also require access to the server if a file is deleted or becomes corrupt, as the application can copy the problematic file(s) automatically from the server.

To ensure that users always have access to an available network server for these circumstances, you can copy the administrative installation to one or more additional servers, and then specify those servers from within this view. If the primary server should become unavailable, the Windows Installer will attempt to connect to the other servers specified here, in the order they are specified. If no server is found, the Windows Installer will prompt the user to specify the location of the server.

See Also
Configuring Additional Server Locations

Setup Properties View

Even though Tuner provides you views to customize many areas of the Windows Installer package, it may be necessary to edit property values that are not available elsewhere. The Setup Properties view exposes the entries in the properties table (the underlying structure of Windows Installer packages). You can also add your own custom properties here.

Properties exist in two formats: Private and Public. Private properties are set by the software vendor or by the Windows Installer during installation and cannot be altered. Private properties are always lowercase, and appear in Tuner in grayed out text. Public properties, which are always in capital letters, can also be set by the software vendor, but can be edited. Tuner also allows the addition of Public properties to the transform. The Public properties that you create can be edited or removed as necessary, whereas preexisting Public properties can only be edited.

Caution • Before you begin changing properties in the Setup Properties view, ensure you know exactly what you are doing. The changes you make may cause validation errors, installation errors, or other unforeseen problems.

See Also
Customizing Setup Properties

Dialogs View

When customizing the Windows Installer package, you may want to disable particular panels that appear during the installation, administrative, patch, or maintenance sequences. You can do so from the Dialogs view.

This view contains a list of each of the four installation modes (installation, administrative, maintenance, and patch), with the associated dialogs that appear as part of the UI sequence during the selected mode. You can enable or disable these dialogs by either the check box to the left of the dialog name, or by using the Show and Hide buttons.

If you hide a dialog that appears in more than one sequence, the dialog is hidden during all sequences.
Note • During each installation mode, Windows Installer displays a Wizard containing a sequence of panels. However, the underlying Windows Installer technology actually uses a series of dialogs displayed in sequence. During runtime, they are referred to as panels (as with other Wizards); at design time, they are individual dialogs that can be enabled or disabled as necessary.

<td>Provides a way to prevent users from running the application setup to modify the product’s installation. Corresponds to the ARPNOMODIFY property in the Setup Properties view.</td>
</tr>
<tr>
<td>Disable Remove Button</td>
<td>Provides a way to prevent users from running the application setup to remove (uninstall) the product from the user’s computer. Corresponds to the ARPNOREMOVE property in the Setup Properties view.</td>
</tr>
</tbody>
</table>
The final step in creating a customization involves two parts. First, you should postvalidate your transform and base Windows Installer package. This ensures that you have not introduced any errors into the installation, and may help you verify that you have corrected errors that existed in the base package. Secondly, you need to actually package the transform and base package for distribution.

These steps are carried out in the following Package Preparation View subviews:

### Package Preparation View

AdminStudio 2019 | Tuner

The final step in creating a customization involves two parts. First, you should postvalidate your transform and base Windows Installer package. This ensures that you have not introduced any errors into the installation, and may help you verify that you have corrected errors that existed in the base package. Secondly, you need to actually package the transform and base package for distribution.

These steps are carried out in the following Package Preparation View subviews:

<table>
<thead>
<tr>
<th>Views</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Postvalidation View</strong></td>
<td>Allows you to ensure that your Windows Installer package is valid. The difference is that it also checks your newly created transform to make sure it is valid in relation to the base package.</td>
</tr>
<tr>
<td><strong>Package View</strong></td>
<td>When you have finished with your transform and postvalidation, the last step is to prepare the overall package so you can distribute it to your users (using a third-party tool such as Microsoft SMS).</td>
</tr>
</tbody>
</table>

### Postvalidation View

AdminStudio 2019 | Tuner

Much like the Prevalidation view, the Postvalidation View allows you to ensure that your Windows Installer package is valid. The difference is that it also checks your newly created transform to ensure it is valid in relation to the base package. You can run the same internal consistency evaluators in the evaluation file, and receive the report back on the overall package and transform validity. By default, all ICEs are checked for the specified evaluation file.

You can select the information level of the displayed results by checking the Show Info Messages, Show Error Messages, and Show Warning Messages check boxes. If any errors are present, the Windows Installer package is invalid. Warning messages highlight potential problems, but will not cause validation to fail. Informational messages display ongoing information during the validation process.

If you started off with a valid Windows Installer package, yet postvalidation fails, it is likely your problems relate to changes you made in the transform. Make sure you look at the Evaluation Files and Internal Consistency Evaluators topic to see what each ICE message means. You can also consult the online MSI Help reference, available from the Help Menu, for more details.

It is also possible to start off with an invalid base package, but the postvalidation does not have any errors. If this happens, the properties you changed in your transform can bring the overall package and transform up to a valid package.
Output of the postvalidation appears in the Output and Validation tabs of the Output Window.

**Viewing the Postvalidation Results**

As each ICE is run, Errors, Warnings, and Info messages are generated, and are listed in the Output tab at the bottom of the interface.

Upon completion of the Postvalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error (○), a Warning (△), or an Informational Message (△), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red.

This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform. For more information, see Direct Editor.

> **Note** • If no errors appear in the results (providing you are displaying errors), then the package and transform are valid against the specific ICES you specified, or against the entire evaluation file (if no ICES were selected).

> **Tip** • It is possible for a package that passed the prevalidation to fail the postvalidation. Remember changes made in the Setup Properties can affect your installation. If your package fails postvalidation, check all changes made in the Setup Properties for accuracy. To identify the original Setup Properties, you can create a new transform file that can be deleted at any time. Changes made using the Direct Editor can also affect your installation’s functionality.

### Package View

When you have finished with your transform and postvalidation, the last step is to prepare the overall package so you can distribute it to your users (using a third-party tool such as Microsoft SMS). Tuner provides several different packaging options that can be used individually or in conjunction with one another. Note that Tuner does not actually perform the distribution; rather, it gathers the necessary files together, and copies them to a location you specify. You can then use some of the standard software distribution tools to roll out your customized package.

The three subviews contained within the Package view are:

**Table 14-24 • Package View Subviews**

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package View/Location View</td>
<td>Place the transform and base Windows Installer file on either an FTP server or network location.</td>
</tr>
</tbody>
</table>
Chapter 14  Customizing Installations Using Tuner

Tuner Reference

### Table 14-24 • Package View Subviews (cont.)

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Package View/Setup View</strong></td>
<td>Package the transform and base Windows Installer file with an executable launcher (Setup.exe) to begin the installation. You have the option of including the MSI Engine for the appropriate platform to ensure Windows Installer functionality. Setup.exe uses information contained in setup.ini to determine the package, associated transform, and any command-line parameters.</td>
</tr>
<tr>
<td><strong>Package View/SMS View</strong></td>
<td>Package and prepare the transform and Windows Installer file for distribution using Microsoft SMS. Tuner can create a PDF file and/or an SMS file for your package and transform.</td>
</tr>
</tbody>
</table>

Note • These three subviews are also available through the Packaging Wizard, which can be accessed from the Project menu by selecting Package.

### Package View/Location View

AdminStudio 2019 | Tuner

It is from the Location View that you specify information regarding where to place the transform and initial Windows Installer file. You have the option to copy files to a network location, including performing an administrative installation, or copy files to an FTP server.

### Package View/Setup View

AdminStudio 2019 | Tuner

In the Setup view, you can set options that are used to create a Setup.exe file to launch both your transform and Windows Installer package. You have the option to include the MSI engine for Windows 95/98 and NT, as well as include any command-line arguments for the installation.

### Package View/SMS View

AdminStudio 2019 | Tuner

In many cases, you may want to perform distribution of the transform and Windows Installer package using Microsoft SMS. Tuner provides a way to create both a Package Definition File (PDF) or an SMS file in the SMS View.

Select the file type(s) you want to create. If you create an SMS file, Tuner can instruct SMS to create a Management Information Format (MIF) file when SMS deploys the package and transform. If you want to do this, provide the Install MIF Filename, Uninstall MIF Filename, and serial number.

For more information about Microsoft SMS, consult the SMS documentation.
Additional Tools View

AdminStudio 2019 | Tuner

Tuner includes an extremely flexible additional tool: the Direct Editor. Using this tool, you can directly edit the Windows Installer tables that make up the Windows Installer package. This provides you with extremely granular control over the transform you are creating.

Direct Editor

AdminStudio 2019 | Tuner

Windows Installer packages are relational databases consisting of dozens of interrelated tables. These tables reflect the application's features, components, relationship between features and components, registry information, and user interface.

The Direct Editor allows you to edit values in the MSI tables of the base Windows Installer package and store them in your transform. As you change values elsewhere in your transform, those changes are reflected in the Direct Editor, and vice versa. The complete list of MSI tables contained in the installation package is displayed in the left pane. When you select a table, the contents are displayed in the right pane.

Working Directly with MSI Tables

The Tuner Direct Editor provides the ability to work directly with MSI tables. This includes the ability to edit the contents, as well as find and replace values.

Tip • When viewing or editing specific tables, pressing F1 launches the Microsoft Windows Installer help system to the appropriate table, if it is a standard Windows Installer table. When F1 is pressed while viewing a non-standard table, the Windows Installer help system launches to its default topic. Consult the software vendor for information about custom tables.

Table Functionality

The following functionality is available for tables:

<table>
<thead>
<tr>
<th>Table 14-25 • Direct Editor Table Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
</tr>
<tr>
<td>Add Records</td>
</tr>
<tr>
<td>Delete Records</td>
</tr>
<tr>
<td>Cut Row(s)</td>
</tr>
<tr>
<td>Copy Row(s)</td>
</tr>
<tr>
<td>Paste Row(s)</td>
</tr>
</tbody>
</table>
Editing Tables by Launching the Direct Editor from the Validation Tab

Upon completion of a Pre- or Postvalidation, the Validation tab is automatically selected, and all of the Errors, Warnings, and Info messages that were generated are listed in table format. Each table row lists an icon to indicate whether it is an Error (.), a Warning (.), or an Informational Message (.), the name of the ICE that generated it, and a brief description of what caused it to occur.

If a row is grayed out, it indicates that the table cannot be edited in the Direct Editor (perhaps because it is in an external package). If a row is active, you can double-click on it to open that row’s associated table. The Direct Editor is launched and the table and/or table cells that are causing the problem are highlighted in red.

This feature makes it very easy for you to use the Direct Editor to edit values in the MSI tables of the base Windows Installer package and store them in your transform.

Resizing Table Columns in the Direct Editor

When you initially open the Direct Editor, the selected table’s columns are listed in a compact format so that the maximum number of columns are displayed.

To automatically resize a column so that its width matches that of its longest entry, double-click on the column heading. This new column width setting is automatically saved and will be implemented the next time you view this table column in the Direct Editor.

Sorting Table Columns in the Direct Editor

To sort a table column, click the column heading once. The order will toggle between ascending and descending.

Adding a New Record Using the Direct Editor
Finding and Replacing Using the Direct Editor

Import INI File Wizard

AdminStudio 2019 | Tuner

Tuner allows you to import any existing INI files that you may have created previously. To import a INI file, you need to launch the Import INI File Wizard.

The Wizard consists of the following panels:

- Welcome Panel
- Import INI File Panel
- Import Conflict Options Panel
- Finishing INI File Import Panel

Within the INI Files View, right-click on a folder under the Destination Computer node (or right-click on the Destination Computer node to add a folder first), and then select Import INI File. The Wizard that appears prompts you for the location of the INI file, as well as what to do when there are conflicts arising from duplicate values. When import occurs, Tuner merges the contents of the INI file with existing INI file data.
Welcome Panel

The Import INI File Wizard allows you to import data contained in an INI file into your transform.

Import INI File Panel

From this panel, you need to specify the name of the INI file (.ini) you want to import into your transform. Alternatively, click Browse and navigate to it.

Import Conflict Options Panel

The Import Conflict Options panel allows you to specify how you want to handle duplicate INI file data.

Select one of the following options for the Wizard to use to determine how to handle these conflicts:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Overwrite the data in the IniFile table</strong></td>
<td>If conflicts exist, the Wizard will overwrite the INI file keys and values with any duplicate keys from the registry file (.reg).</td>
</tr>
<tr>
<td><strong>Do not overwrite the data in the IniFile table</strong></td>
<td>If duplicate keys and values are found, the Wizard will retain the existing INI file data and not overwrite it.</td>
</tr>
</tbody>
</table>

Click Import to import the .ini file. When the file has been imported, the Finishing INI File Import Panel is displayed.

Finishing INI File Import Panel

This panel appears following import of the .ini file. Click Finish to exit the Wizard and return to the INI Files View.

Import REG File Wizard

Tuner allows you to import any existing REG files that you may have created previously. To import a REG file, you need to launch the Import REG File Wizard.

The Wizard consists of the following panels:

- Welcome Panel
- Import Registry File Panel
To launch the Import REG File Wizard, go to the Registry View, right-click on one of the registry hives or on a registry key you have added, and select Import REG File from the shortcut menu.

The Wizard that appears prompting you for the location of the registry file, as well as what to do when there are conflicts arising from duplicate keys. When import occurs, Tuner merges the contents of the REG file with existing registry data.

Welcome Panel

The Import REG File Wizard allows you to add registry data contained in a registry file (.reg) into your transform.

Import Registry File Panel

From this panel, you need to specify the name of the registry file (.reg) you want to import into your transform. Alternately, click Browse and navigate to it.

Import Conflict Options Panel

The Import Conflict Options panel allows you to specify how you want to handle duplicate registry keys and values. Select one of the following options for the Wizard to use to determine how to handle these conflicts:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overwrite the registry data</td>
<td>If conflicts exist, the Wizard will overwrite the registry keys and values with any duplicate keys from the registry file (.reg).</td>
</tr>
<tr>
<td>Do not overwrite the registry data</td>
<td>If duplicate keys and values are found, the Wizard will retain the existing registry data and not overwrite it.</td>
</tr>
</tbody>
</table>

Click Import to import the .reg file. When the file has been imported, the Finishing Registry Import Panel opens.

Finishing Registry Import Panel

This panel appears following import of the .reg file. Click Finish to exit the Wizard and return to the Registry View.
Packaging Wizard

The Packaging Wizard provides a way to step through the packaging process for the transform and Windows Installer package. Please note that this packaging merely places the installation on a network location or FTP server, creates a Setup.exe file, and/or creates files for SMS distribution. It does not actually distribute the installation to client machines. To invoke the Packaging Wizard, select Packaging Wizard from the Project menu, or select the Packaging Wizard button from the toolbar.

The Packaging Wizard consists of the following four panels:

- Location Panel
- Setup.exe Panel
- SMS Panel
- Packaging Summary Panel

Location Panel

The first panel of the Packaging Wizard allows you to specify the location to store the installation files (including transforms). If you select Network Location, you can specify or browse to the directory location.

Alternately, you can copy the installation files to an FTP server. If you select this option, you must specify the FTP location (URL), the user name under which to log in, and the password.

Setup.exe Panel

This Packaging Wizard panel allows you to include a setup.exe launcher for your package and transform, and include the appropriate MSI engine for Windows 9x or NT. You can also specify command-line arguments for the Windows Installer.

SMS Panel

In many cases, you may want to perform distribution of the transform and Windows Installer package using Microsoft SMS. Tuner provides a way to create both a Package Definition File (PDF) or an SMS file in the SMS View. Select the file type(s) you want to create. If you create an SMS file, Tuner can instruct SMS to create a Management Information Format (MIF) file when SMS deploys the package and transform. If you want to do this, provide the Install MIF Filename, Uninstall MIF Filename, and serial number.
Packaging Summary Panel

The Package Summary panel informs you of the packaging options selected in the three previous panels. If you need to make changes, use the Back button to return to the previous panel. The Cancel button aborts the packaging operation. If you are satisfied with the selected options, click Finish to copy the installation files to the specified location and/or create Setup.exe and SMS files.
Using Analyze to Perform Package Testing

Application Manager’s Analyze view is a unified testing, reporting, and issue management interface that simplifies and streamlines all phases of application compatibility testing. Using Analyze, you can execute a broad range of compatibility, validation and conflict tests; manage and re-mediate issues; and monitor overall status in a single location.

Information about using Analyze is organized into the following sections:

Table 15-1 • Using the Analyze Tab

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analyze Overview</td>
<td>Provides an overview of the tasks you can perform using Analyze, the benefits of using Analyze, the groups of tests that are available to run, and explains how functionality found in previous releases of AdminStudio is now performed using Analyze.</td>
</tr>
<tr>
<td>Configuring Testing Options on the Analyze Tab</td>
<td>Explains how to select the tests to execute, and how to set resolution options.</td>
</tr>
<tr>
<td>Performing Compatibility, Best Practices, and Risk Assessment Testing</td>
<td>Describes how to perform testing for operating system compatibility, best practices, risk assessment, and application virtualization compatibility.</td>
</tr>
<tr>
<td>Performing MSIX Conversion Compatibility Testing</td>
<td>Describes how to perform MSIX conversion compatibility on msi packages in the Application Catalog.</td>
</tr>
<tr>
<td>Performing Application Conflict Testing</td>
<td>Describes how to perform conflict testing between source packages and target packages/operating systems.</td>
</tr>
</tbody>
</table>
Chapter 15  Using Analyze to Perform Package Testing

Analyze Overview

AdminStudio 2019 | Application Manager

Edition • Application Manager, including Analyze, is included with AdminStudio Professional and Enterprise Editions.

Application Manager’s Analyze view is a unified testing, reporting, and issue management interface that simplifies and streamlines all phases of application compatibility testing. Using Analyze, you can execute a broad range of compatibility, validation and conflict tests; manage and remediate issues; and monitor overall status in a single location.

Tasks You Perform Using Analyze

The main tasks that you perform using Analyze involve clicking one of the following buttons on the Analyze tab ribbon:

Table 15-2 • Tasks You Perform Using Analyze

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Select Tests to Execute" /></td>
<td>Click to open the Select Tests to Execute dialog box, where you can select the tests that you want to execute when the Execute Tests button is clicked. On this dialog box, you can also set automatic fix preferences for the Operating System Compatibility and Browser Compatibility test groups. See Configuring Testing Options on the Analyze Tab.</td>
</tr>
</tbody>
</table>
**Table 15-2 • Tasks You Perform Using Analyze**

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| ![Execute Tests](image) | **Execute Tests** Click to execute the following groups of tests against the selected Windows Installer, App-V, Apple iOS, or Google Android package or against all of the packages in the selected application or group:  
  - Operating System Compatibility  
  - MSIX Conversion Compatibility  
  - Browser Compatibility  
  - Application Virtualization Compatibility  
  - Best Practices  
  - Risk Assessment  
  - Remote Application Publishing Compatibility  
  If a web application is selected when **Execute Tests** is clicked, only the browser compatibility tests will be executed.  
| ![Launch Conflict Wizard](image) | **Launch Conflict Wizard** Click to open the Conflict Wizard, which you can use to run the Application Conflicts group of tests to determine conflicts between the source and target packages.  
  See Performing Application Conflict Testing. |

  See Performing Dynamic Testing of Web Applications. |
| ![Resolve Issues](image) | **Resolve Issues** Click to apply automatic fixes to those errors and warnings for which fixes are available.  
  See Resolving Issues. |

**Viewing Test Results in Analyze**

Analyze offers both summary and detailed test result views. Summary views display icons to quickly indicate the overall tests status of the package, application, or group of applications per test category:
Chapter 15  Using Analyze to Perform Package Testing

Analyze Overview

Figure 15-1: Analyze Group View

More Information

For more information about Analyze, see the following topics:

- Benefits of Using Analyze
- Test Run Optimization
- About Mobile Application Testing
- About Microsoft Windows Application Compatibility Infrastructure Testing

Benefits of Using Analyze

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Using Analyze, you can execute a broad range of compatibility, validation and conflict tests; manage and remediate issues; and monitor overall status in a single location.

Using Analyze provides the following benefits:

- **Full suite of tests**—When using Analyze, with a single click you can simultaneously test groups of Windows Installer, App-V, Apple iOS, and Google Android packages for operating system compatibility, MSIX Conversion Compatibility, best practices, risk assessment, and application virtualization compatibility. You can also quickly perform conflict analysis between source and target packages/operating systems using a streamlined Conflict Wizard.

- **Web application testing**—Web applications can be tested for browser compatibility both statically (by automatically crawling through the pages of the application) and dynamically (by launching the web application and testing those pages that are visited by the tester as they click through the site).

- **Efficient issue resolution**—In Analyze, you can manage the resolution of issues efficiently. You can filter results by test group. With one click, you can automatically resolve a single set of issues, groups of issues, or all issues. You can also suppress issues that the packaging manager feels should not be resolved.

- **Test run optimization**—When you initiate testing, Analyze checks to see which of the selected tests have already been run on the selected applications. If an application’s packages or associated transform files have not changed, Analyze will run only those tests which have not yet been run. This enables you to halt testing at any time, and restart...
it later without unnecessarily repeating the run of any of the selected tests. For more information, see **Test Run Optimization**.

- **Integrated into the Application Catalog**—Analyze is a fully integrated component of the AdminStudio Application Manager and Application Catalog, which serves as the central repository for applications in all formats. Using the catalog structure, you can execute tests at a package level, an application level, a group level or even across an entire catalog. You can also manage and resolve issues in the same manner, from the same interface, giving you a single place to manage multiple steps of the packaging process.

- **Integration with Microsoft ACT database**—You can integrate Application Manager Analyze with your Microsoft ACT (Application Compatibility Toolkit) database and display ACT test results. ACT is used to create an inventory of an organization’s installed applications, computers, and devices, and enables you to collect compatibility data. For more information, see **Integrating with Microsoft Application Compatibility Toolkit (ACT)**.

## Test Run Optimization

*AdminStudio 2019 | Application Manager*

**Edition** • *Application Manager is included with AdminStudio Professional and Enterprise Editions.*

To make testing more efficient, Application Manager has a test run optimization option that can speed up the testing of large groups of packages, and enable you to perform testing incrementally without rerunning tests unnecessarily.

If the **Optimize each test run** option on the **Analyze** tab of the Application Catalog **Options** dialog box is selected, when you click **Execute Tests**, Application Manager will only execute tests on a package that were not previously run. If this option is selected, before beginning testing, Application Manager:

- Checks each selected package to see which tests have been run on it and which have not been run.
- Checks each selected Windows Installer file (and its transform files) and App-V package to see if it has changed since the last time that testing was performed.

If the packages have not changed, Application Manager will then only execute those selected tests which have not yet been run.

If the **Optimize each test run** option is not selected, Application Manager will execute all selected tests on all selected packages each time testing is initiated, even if the test has already been run on a package and neither the package nor its transform file has changed.

If you have a large number of applications in your Application Catalog, selecting this option enables you to start testing, then click **Stop** to pause testing when you want to access Application Manager to perform other tasks. When you click **Stop**, Application Manager would finish executing the current test. When you were ready to resume testing, you could then click **Execute Tests** and Application Manager would immediately begin testing where it left off the last time testing was performed.
About Mobile Application Testing

AdminStudio 2019 | Application Manager

You can import and test both local mobile app files and links to mobile apps in public stores. The supported import types along with the available testing categories is summarized in the following table.

Table 15-3 • Mobile App Testing by Type

<table>
<thead>

About Microsoft Windows Application Compatibility Infrastructure Testing

AdminStudio 2019 | Application Manager

The Microsoft Windows Application Compatibility Infrastructure (Shim Infrastructure) is a technical solution provided by Microsoft to ensure compatibility of existing software with new releases of their operating systems.
As the Windows operating system evolves from version to version—changing to support new technology or incorporate bug fixes—changes may affect existing applications. It is often not possible to modify the application to address these operating system changes. To make sure that these applications will continue to work in the updated operating systems, Microsoft uses the Shim Infrastructure to provide fixes (such as a transform or custom action) for a particular application version that may encounter problems in the updated operating system.

When Microsoft identifies an installer/application/driver with an incompatibility with a specific operating system, Microsoft will either provide a “shim” to enable it to run (such as a transform or custom action) or blocks it from running.

Analyze includes tests to scan installers, applications, and drivers for known runtime compatibility issues with various operating systems that have been documented in the Microsoft Windows Application Compatibility Infrastructure. The following table lists the test numbers of these tests.

**Table 15-4 • Microsoft Windows Application Compatibility Infrastructure Test Numbers**

</tbody>
</table>
Analyze can identify these compatibility issues during testing and alert you to potential issues. If the installer/application/driver will not run in a particular operating system, an error will be generated. If a ‘shim’ exists to enable it to run at, perhaps, reduced functionality, a warning will be generated.

If a warning or error is generated by one of these tests, it is recommended that you find out if a newer version of the installer/application/driver is available.

Note • For more information, see Understanding Shims in the Microsoft TechNet Library.

### Configuring Testing Options on the Analyze Tab

AdminStudio 2019 | Application Manager

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Before you begin testing, you need to specify which tests are going to be run, and specify auto-fix options for Operating System Compatibility, MSIX Conversion Compatibility, and Browser Compatibility tests. Both of these tasks are performed on the Select Tests to Execute dialog box. This dialog box also provides detailed information on each test, including information on how to resolve issues that are found.

For information on configuring testing, see the following topics:

- **About Analyze Tests**
- **Selecting Tests to Execute**
- **Setting the Compliance Level for Operating System Compatibility and Browser Compatibility Tests**
- **Setting Automatic Fix Preferences for Operating System Compatibility and Browser Compatibility Tests**
- **Updating the Location of the Custom ACE Rule File**
- **Changing the ICE Validation File**
- **Creating Custom Mobile Tests Using the Mobile Test Wizard**

<table>

</tbody>
</table>
About Analyze Tests

AdminStudio 2019 | Application Manager

Analyze offers the following groups of tests:

Table 15-5 • Analyze Test Group

<table>
<thead>
<tr>
<th>Test Group</th>
<th>Description</th>
</tr>
</thead>
</table>
| Best Practices Tests      | This category of tests checks the structure of Windows Installer packages, App-V packages, and mobile apps, and determines if they violate best-practice guidelines. This category includes the following areas:  
                           | - Windows Installer internal consistency evaluators (ICEs)  
                           | - Windows best practices  
                           | - Microsoft App-V best practices  
                           | For of a detailed description of all of the tests in this category, see Best Practices Tests.                                      |
| Risk Assessment Tests     | This category of tests perform risk assessment checks for both mobile and desktop apps. This category includes the following areas:  
                           | - Mobile risk assessment  
                           |   - Android Mobile  
                           |   - Apple Mobile  
                           |   - Windows Mobile  
                           | - Desktop risk assessment  
                           | For of a detailed description of all of the tests in this category, see Risk Assessment Tests.                                      |
| Application Conflicts     | This category of tests identifies conflicts between packages in the Application Catalog, as well as between packages and OS Snapshots. This category includes tests for Windows Installer packages and Microsoft App-V packages.  
                           | For of a detailed description of all of the tests in this category, see Application Conflicts Tests.                                      |
### Operating System Compatibility Tests

This category of tests checks packages for application readiness on the following operating systems:

- Microsoft Windows 7 (32 bit and 64 bit)
- Windows Server 2008 R2
- Windows 8.1 (32 bit and 64 bit)
- Windows 10 1607 (and 2016 LTSC) (32 bit and 64 bit)
- Windows 10 1703 (32 bit and 64 bit)
- Windows 10 1709 (32 bit and 64 bit)
- Windows 10 1803 (32 bit and 64 bit)
- Windows 10 1809 (and 2019 LTSC)(32 bit and 64 bit)
- Windows Server 2012

For a detailed description of all of the tests in this category, see Operating System Compatibility Tests.

### MSIX Conversion Compatibility

This category of tests analyzes Windows Installer packages to determine if they are suitable candidates for conversion to msix:

- Desktop

For a detailed description of all of the tests in this category, see MSIX Conversion Compatibility Tests.

### Browser Compatibility Tests

This category of tests checks web applications for compatibility with the following browsers:

- Internet Explorer 11
- Microsoft Edge

For a detailed description of all of the tests in this category, see Browser Compatibility Tests.
Table 15-5 • Analyze Test Group

<table>
<thead>
<tr>
<th>Test Group</th>
<th>Description</th>
</tr>
</thead>
</table>
| Application Virtualization Compatibility Tests | This category of tests analyzes Windows Installer packages to determine if they are suitable candidates for virtualization to the following formats:  
  - Microsoft App-V  
  - VMware ThinApp  
  - Citrix XenApp  
  For of a detailed description of all of the tests in this category, see Application Virtualization Compatibility Tests. |

**Note** • The Application Virtualization Compatibility tests are always run any time that you run tests in Analyze. However, the selections you make on the Select Tests to Execute dialog box determine which virtual formats to display in test results.

| Remote Application Publishing Compatibility | This category of tests checks Windows Installer packages for compatibility to be run via Windows Remote Desktop.  
  - Windows Remote Desktop Service tests  
  For of a detailed description of all of the tests in this category, see Remote Application Publishing Compatibility Tests. |

Selecting Tests to Execute

AdminStudio 2019 | Application Manager

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

To select which tests are run each time **Execute Tests** or **Launch Web Test** is clicked, or when the Conflict Wizard is run, perform the following steps:

**Task** • To select the tests to execute:

1. Open the Application Manager **Analyze** tab.
2. Click **Select Tests to Execute** in the ribbon. The **Select Tests to Execute** dialog box opens.
3. Expand the tree listing and, in each of these groups, select the tests that you want to execute each time the **Execute Tests** button or the **Launch Web Test** button is clicked:
   - Operating System Compatibility Tests
   - MSIX Conversion Compatibility Tests
   - Browser Compatibility Tests
   - Application Virtualization Compatibility Tests
   - Best Practices Tests
   - Risk Assessment Tests
   - Application Conflicts Tests
   - Remote Application Publishing Compatibility Tests

   When you select a test in the tree, information about that test is displayed in the right pane. Reviewing this information may assist you in making your selections.

4. In the **Application Conflicts Tests** test group, select the tests that you want to run each time you perform conflict analysis using the Conflict Wizard.

5. Click **OK** close the dialog box.
Chapter 15  Using Analyze to Perform Package Testing
Configuring Testing Options on the Analyze Tab

Note • To add custom ACE tests to the set of tests that are executed, see Updating the Location of the Custom ACE Rule File. You may want to do this if you have written some of your own custom ACE tests (as described in Creating Your Own Custom ACE Tests).

Note • To change the set of ICE tests that are run, see Changing the ICE Validation File.

Setting the Compliance Level for Operating System Compatibility and Browser Compatibility Tests

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Instead of selecting individual Operating System Compatibility and Browser Compatibility tests to run on the Select Tests to Execute dialog box, you have the option of using the Test Configuration Wizard to identify the tests to run by selecting one of three compliance levels, which are based on industry standard compliance rule sets:

- **Complete Analysis**—Test applications for all potential Operating System Compatibility and Browser Compatibility issues.
- **Industry Standard Analysis**—Test applications for all potential Browser Compatibility issues, but only test for the Operating System Compatibility issues that would cause an application to fail.
- **Industry Standard Analysis With Auto-Fixes**—Only test applications for potential Operating System Compatibility issues for which an automatic fix is available.

You can also further refine the tests that are run by specifying an OS Snapshot to test against. For example, if you select a Windows 7 32-bit OS Snapshot, only Windows 7 32-bit Operating System Compatibility tests will be selected, and only Internet Explorer 11 Browser Compatibility tests will be selected. When you select an OS Snapshot to use to filter the test selection, the following items are considered:

- Operating system version
- Operating system patches applied
- Internet Explorer version installed
- .NET framework version installed

To set the compliance level for Operating System Compatibility and Browser Compatibility tests using the AdminStudio Test Configuration Wizard, perform the following steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>To use the AdminStudio Test Configuration Wizard:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Application Manager Analyze tab.</td>
</tr>
<tr>
<td>2.</td>
<td>Click Select Tests to Execute in the ribbon. The Select Tests to Execute dialog box opens.</td>
</tr>
</tbody>
</table>
3. Click the Test Configuration Wizard button in the lower left. The Compliance Level panel of the AdminStudio Test Configuration Wizard opens.

4. Use the slider to select one of the following options:
   - **Complete Analysis**—Test applications for all potential Operating System Compatibility and Browser Compatibility issues.
   - **Industry Standard Analysis**—Test applications for all potential Browser Compatibility issues, but only test for the Operating System Compatibility issues that would cause an application to fail.
   - **Industry Standard Analysis With Auto-Fixes**—Only test applications for potential Operating System Compatibility issues for which an automatic fix is available.

   **Important** • The Compliance Level selection you make on this panel does not affect the selection of tests in the Application Conflicts, Application Virtualization Compatibility, Best Practices, Risk Assessment, or Remote Application Publishing Compatibility test categories.

5. Click Next. The OS Snapshot(s) panel opens, listing all OS Snapshots you have imported into your Application Catalog.
6. If desired, select an OS Snapshot to test against. When you select an OS Snapshot to use to filter the test selection, the following items are considered:
   - Operating system version
   - Operating system patches applied
   - Internet Explorer version installed
   - .NET framework version installed

7. Click Next. The Summary panel opens, listing your selections.
8. Click **Next**. A message appears stating that the test configuration has been updated.

9. Click **Finish** to close the wizard.
10. Notice the following changes that have been made in the Available Tests list:

<table>
<thead>
<tr>
<th>Test Category</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating System Compatibility</td>
<td>The Operating System Compatibility tests that are selected depend upon the level you chose on the Choose a Compliance Level panel. The selection of Operating System Compatibility tests will be further filtered if you selected an OS Snapshot on the OS Snapshot(s) panel. The only Operating System test categories that will have any selected tests will be the categories of the selected operating systems. For example, if you choose a Windows 8 64-bit OS Snapshot, tests will be selected only in the Windows 8 64-bit test category:</td>
</tr>
</tbody>
</table>
|            | ![Operating System Compatibility Diagram](image)
| Browser Compatibility                   | If the Industry Standard Analysis With Auto-Fixes level is chosen, none of the Browser Compatibility tests will be selected. If either of the other two levels is chosen, all Browser Compatibility tests will remain selected, unless you have also selected an OS Snapshot on the OS Snapshot(s) panel. In that case, only the Internet Explorer tests that correspond with the selected OS Snapshot will be selected. |
| Application Conflicts                   | Test selection in these test categories are not affected by any selections made in the AdminStudio Test Configuration Wizard.                                                                                                                                 |
| Application Virtualization Compatibility |                                                                 |
| Best Practices                         |                                                                 |
| Risk Assessment                        |                                                                 |
| Remote Application Publishing Compatibility |                                                                 |

Setting Automatic Fix Preferences for Operating System Compatibility and Browser Compatibility Tests

AdminStudio 2019 | Application Manager

For some of the tests in the Operating System Compatibility and Browser Compatibility test group, you have the option of specifying how you want Application Catalog to resolve automatically resolvable issues. You can instruct Application Catalog to perform the basic auto fix, the advanced auto fix, or not to fix issues generated by the test.

To set automatic fix preferences for operating system compatibility and browser compatibility tests, perform the following steps.

Task

To set automatic fix preferences for operating system compatibility and browser compatibility tests:

1. On the Analyze tab of Application Manager, click the Select Tests to Execute button in the ribbon. The Select Tests to Execute dialog box opens.

2. In the Operating System Compatibility or Browser Compatibility test group, select the test that you want to modify. A description of that test appears in the right pane.

3. After reviewing the information, scroll down until you locate the Default Fix section:

   Note • For some tests, one of these options is disabled. For others, all options are disabled.

4. Select one of the following options to specify the action Application Catalog should take when you click the Resolve Issues button in the ribbon:

<table>
<thead>
<tr>
<th>Fix Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not resolve this issue</td>
<td>Select this option if you do not want Application Catalog to automatically</td>
</tr>
<tr>
<td>automatically</td>
<td>resolve any issues generated by this test.</td>
</tr>
<tr>
<td>Apply the basic auto fix</td>
<td>Select this option if you want Application Catalog to resolve issues generated</td>
</tr>
<tr>
<td></td>
<td>by this test by applying the basic auto fix.</td>
</tr>
<tr>
<td></td>
<td>Applying the basic auto fix is relatively safe. It results in minimal changes</td>
</tr>
<tr>
<td></td>
<td>to an MSI package via a Windows Installer transform. It does not change the</td>
</tr>
<tr>
<td></td>
<td>target system’s security or a system policy.</td>
</tr>
</tbody>
</table>

   Note • For some tests, one of these options is disabled. For others, all options are disabled.
Chapter 15 Using Analyze to Perform Package Testing

Configuring Testing Options on the Analyze Tab

5. Click **OK**.

**Note** • The test description pane often also includes information on how to perform a manual fix. For more information, see Performing Manual Issue Resolution.

**See Also**

## Updating the Location of the Custom ACE Rule File

AdminStudio 2019 | Application Manager

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

You can optionally use user-defined custom ACEs to extend the functionality of existing tests with company-specific functionality. By selecting different user-defined ACE files, you can organize rules appropriate for individual users in your organization.

To specify that you want custom ACE tests to be executed when the **Execute Tests** button is clicked or when the Conflict Wizard is run, perform the following steps:

**Task** **Updating the location of the Custom ACE rule file:**

1. Create custom ACE tests, as described in Creating Your Own Custom ACE Tests.

   By default, an empty user-defined ACE file is installed in the following location on the machine where AdminStudio is installed.

   `AdminStudio Shared Directory\ConflictSolver\CustomConflictFile.ace`

2. Open the **ACE Tests** tab of the Application Catalog **Options** dialog box.

3. In the **Custom ACE Rule File** field, select the custom ACE file containing the ACEs that you want to run.

   **Note** • Only one user-defined ACE file can be active at one time.
Changing the ICE Validation File

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Validation involves comparing a Windows Installer package against a known criteria to identify deviations from those rules. By default, Application Catalog compares packages against the full Windows Installer validation suite. This suite contains a comprehensive set of *Internal Consistency Evaluators (ICEs)*—guidelines created by Microsoft to ensure an installation package works correctly with the Windows Installer engine.

The CUB files containing these ICE validation tests are specified on the Virtualization and Windows Installer tab of the Application Catalog Options dialog box. By default, the following CUB files are specified:

- `C:\Program Files (x86)\AdminStudio\2019\Common\Support\darice.cub`
- `C:\Program Files (x86)\AdminStudio\2019\Common\Support\MergeMod.cub`

In the overwhelming majority of cases, these are the files you will want Application Catalog to use. However, there may be times you want to compare your packages against a different validation file, depending on your needs.

To specify a different ICE validation file, perform the following steps.

**Task**

To specify a different validation file to use:

1. In Application Catalog, select Options on the Application Catalog menu. The Options dialog box opens.
2. Open the Virtualization and Windows Installer tab.
3. Next to the Windows Installer CUB validation file and Merge Module CUB validation file fields, click the browse button ( ) and select the validation file (.cub) that you would like to use.

   The files specified in these fields contain the Internal Consistency Evaluators (ICEs) that will be used for validation of Windows Installer packages and merge modules.

Creating Custom Mobile Tests Using the Mobile Test Wizard

**Edition** • This feature is included with AdminStudio Professional Edition with Mobile.

AdminStudio’s mobile risk assessment tests enable you to find out which features a specific mobile app uses, such as telephone, location services, camera, microphone, etc. You can enhance this testing by using the Mobile Test Wizard to create custom tests that combine risk assessment checks with AND or OR operators.

For example, you could create a custom test to see if a mobile application uses a gyroscope OR accelerometer. Or you could create a test that determines whether a mobile application uses location services AND allows location tracking.

To create a custom test, perform the following steps.
1. In Application Catalog, select Options on the Application Catalog menu. The Options dialog box opens.

2. Open the General Options > Mobile Tests tab.

3. Click New. The Select the Tests panel opens.

4. From the Test Type list, select a category. The available tests in that category are listed in the box on the left.

Existing mobile tests, if any, are listed in the pane on the right, under one of the listed categories.
5. Use the arrow buttons to move the tests you want to include in the custom test to the list on the right. As you add the tests, join them using AND or OR operators by making selections from the Operator drop down list.
Chapter 15  Using Analyze to Perform Package Testing

Configuring Testing Options on the Analyze Tab

6. After you have selected the tests and joined them with the AND or OR operator, you click Next. The Provide the Test Details panel opens.

For example, the following test would test a iOS mobile app to see if it requires iPad and WiFi.
Chapter 15  Using Analyze to Perform Package Testing
Configuring Testing Options on the Analyze Tab

7. Enter the following information:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to identify this custom test. This name will be displayed on the Mobile Tests panel of the Options dialog box. This name will also be displayed on the Select Tests to Execute dialog box, and in test results on the Analyze tabs.</td>
</tr>
<tr>
<td>Brief Description</td>
<td>Enter a short description of the purpose of this test. This text will be displayed under Brief Description on the Select Tests to Execute dialog box when this test is selected in the tree.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a thorough description of how this test works and why it was created. This text will be displayed under Background on the Select Tests to Execute dialog box when this test is selected in the tree.</td>
</tr>
<tr>
<td>More Information</td>
<td>Enter a link to a web page that provides additional information on this custom mobile test. This hypertext link will be listed under More Information on the Select Tests to Execute dialog box when this test is selected in the tree.</td>
</tr>
</tbody>
</table>

8. Click Next. The Summary panel opens.
9. Click **Finish**. The custom mobile test is created.

**Viewing Custom Mobile Tests**

After you create a custom mobile test, it is listed on the **Mobile Tests** tab of the **Options** dialog box

![Custom Mobile Tests](image)

**Figure 15-2:** Custom Mobile Test on the Mobile Tests Tab of Options Dialog Box

The custom mobile test is also listed in the tree on the **Select Tests to Execute** dialog box at the bottom of the list of tests in that category:
Chapter 15 Using Analyze to Perform Package Testing
Configuring Testing Options on the Analyze Tab

Figure 15-3: Select Tests to Execute Dialog Box

The information that was entered in the Brief Description, Description, and Help URL fields of the Provide the Test Details panel of the Mobile Test Wizard is displayed in the pane on the right of the Select Tests to Execute dialog box when the custom test is selected in the tree.

Mobile Test Wizard

Performing Compatibility, Best Practices, and Risk Assessment Testing

On the Application Catalog Analyze tab, you perform compatibility, best practices, and risk assessment testing of selected packages simultaneously using the Execute Tests button in the ribbon.

You can test a group of packages (and all of its subgroups), a single application, or a single package. Tests are run on packages of all deployment types simultaneously, including Windows Installer packages, Apple iOS and Google Android mobile apps, App-V packages, and web applications.

**Note** • You can also perform dynamic testing of web applications. See Performing Dynamic Testing of Web Applications.

When you click the Execute Tests button, Application Catalog runs all of the selected tests in the following test categories:

- Application Virtualization Compatibility Tests
- Best Practices Tests
- Risk Assessment Tests
- Operating System Compatibility Tests
- Browser Compatibility Tests
- Remote Application Publishing Compatibility Tests

**Note** • The Application Virtualization Compatibility tests are always run any time that you run tests in Analyze. However, you can choose which virtual formats to display in test results. For more information, see Choosing the Virtual Formats to Display in Test Results.

**Note** • By default, all of the selected tests on packages are run immediately after import. To disable this feature, you need to clear the selection of the Automatically Execute Tests After Import option on the Import Options tab of the Application Catalog Options dialog box.

To test a package or group of packages for compatibility, best practices, and risk assessment, perform the following steps.
Performing MSIX Conversion Compatibility Testing

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

You can test the Windows Installer (.msi) packages in your Application Catalog for compatibility for conversion to MSIX package format.
When a Windows Installer package is tested during import or by clicking the **Execute Tests** button on the **Analyze** tab, the MSIX conversion compatibility tests are run. The results of these tests are listed in the **MSIX Conversion Compatibility** column under **Supportability Risks** on the Analyze Group View and Analyze Application View.

To test the Windows Installer packages in your Application Catalog for compatibility for conversion to MSIX package format, perform the following steps.

## Testing Windows Installer Packages for MSIX Conversion Compatibility

AdminStudio 2019 | Application Manager

To test Windows installer packages for MSIX conversion compatibility, perform the following steps.

<table>
<thead>
<tr>
<th>Task</th>
<th>To test Windows Installer packages for MSIX conversion compatibility:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the Application Manager <strong>Analyze</strong> tab.</td>
</tr>
<tr>
<td>2.</td>
<td>Make sure that the <strong>MSIX Conversion Compatibility</strong> tests are selected by performing the steps in Selecting Tests to Execute.</td>
</tr>
<tr>
<td>3.</td>
<td>In the Application Manager tree, select the group or application containing the Windows Installer packages you want to test, and then click <strong>Execute Tests</strong>.</td>
</tr>
<tr>
<td>4.</td>
<td>Testing is initiated and messages are displayed in the Output window. When testing is finished, Completed testing package(s) is displayed in the Output window.</td>
</tr>
<tr>
<td>5.</td>
<td>Open the chart format of the <strong>Analyze Group View</strong> and view the <strong>MSIX Conversion Compatibility</strong> pie chart to see a summary of all packages that were tested for MSIX conversion compatibility.</td>
</tr>
</tbody>
</table>

6. Open the list format of the **Analyze Group View** or the **Analyze Application View**. Status icons are listed in the **MSIX Conversion Compatibility** column under **Supportability Risks**.
## Each package is identified as with one of the following icons:

<table>
<thead>
<tr>
<th>Test Result</th>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Recommended</strong></td>
<td>✅</td>
<td>Recommended for conversion to MSIX format.</td>
</tr>
<tr>
<td><strong>Not Recommended</strong></td>
<td>✗</td>
<td>Not recommended for conversion to MSIX format.</td>
</tr>
</tbody>
</table>
7. To view the detailed errors and warnings for those packages with the status of Not Recommended, click on the Not Recommended icon until you drill down to the Supportability Risks Detail view, where you can expand the test name to view all generated errors:

![Supportability Risks Detail view]

Note • The results of MSIX conversion compatibility tests are also listed in the MSIX Conversion Compatibility report on the Reports tab. This report identifies each application in the Application Catalog as either Recommended for conversion to the MSIX package format or Not Recommended.

Converting your Existing Packages to MSIX using Repackager Tool and Digital Signing

AdminStudio 2019 | Application Manager

To convert your existing packages to MSIX using the Repackager tool and digital signing, perform the following steps.

Task To convert existing packages to MSIX using Repackager and digital signing:

1. Launch Repackager.
2. Repackage an .msi or .exe to convert to .msix format.
3. On the **Repackaged Output Options** dialog box, select a package.

![Repackaged Output Options dialog box](image)

4. You can select any of the following options to convert the package:

   - **Create Microsoft MSIX Package**—You can convert the selected package to MSIX package but will not be signed digitally.

   - **Digitally Sign MSIX**—You will need a valid Pfx file certified by CA, Pfx file password, Certificate Subject and the Store name where to find the certificate.

   If you select the **Digitally Sign MSIX** option, the **Certificate Selection** dialog box is displayed.

![Certificate Selection dialog box](image)

5. To convert to digital signing, select either the **Select the Pfx path and password** or **Check from Store** option.

6. Click **OK**.

7. Click **Build**. The package is created in the **MSI_Package** folder.
Signing the MSIX Package in the Application Catalog

To sign a selected MSIX app package using the Sign Tool, you can either use the pfx file or the subject name.

- Signing an MSIX App Package Using a pfx File
- Signing an MSIX App Package Using a pfx File

**Important** - AdminStudio uses the Sign Tool to sign the MSIX application package. You will need to install this tool in order to use this feature. Also, you will need the latest version of Windows 10 in order to use the Sign Tool.

**Signing an MSIX App Package Using a pfx File**

An MSIX package can be signed using a certificate using the pfx file type.

**Task**

**To sign an MSIX app package using a pfx File:**

1. On the **Certificate Information** panel of the Sign Tool, select **PFX File** from the **Certification information type** list.

2. Enter the **PFX file path** and **Password**.

3. Click **Sign**.
Signing an MSIX App Package Using the Subject Name

An MSIX package can be signed using the subject name.

Task

To sign an MSIX app package using the subject name:

1. On the Certificate Information panel of the Sign Tool, select Subject Name from the Certification information type list.

   ![Certificate Information panel](image)

   **Note** • If the subject name is not found in the specified store, you will receive an error message - “No certificates were found that met all the given criteria”.

2. Enter a Subject Name.

   **Note** • By default, the store name is User. The possible values for a specific store are MY, Root, Trust, and CA.

3. To select a specific store, select an option under Select Store: User, Machine, or Store Name.

   **Important** • AdminStudio uses the Sign Tool to sign the MSIX application package. You will need to install this tool in order to use this feature. Also, you will need the latest version of Windows 10 in order to use the Sign Tool.
Scanning and Checking Whether or Not the Package Has Shortcuts for MSIX Conversion

AdminStudio 2019 | Application Manager

To scan and check whether or not a package has shortcuts for the MSIX conversion, perform the following steps.

Task To scan and check whether a package has shortcuts for MSIX conversion:

1. Open the Analyze tab of Application Manager.
2. Click Select Tests to Execute. The Select Tests to Execute dialog box appears.
3. Under MSIX Conversion Compatibility, expand the Desktop tree to view the tests.
4. Select MSIX003: Shortcuts check box.
5. Click OK.
6. Click Execute Tests in the ribbon.
Wrapping MSI/EXE Packages to Wise Script Wrapped EXEs

**Task**  
To wrap msi/exe packages to wise script wrapped exes:

By default, your default template location and a wrapped packages output directory which will help you wrap the packages.

On a new tab of the Application Catalog Options dialog box, Wrap Options, you can set an option automatically to wrap a package during import from the template, you can specify the location of the template directory and the output directory for PowerShell Wrapping and EXE Wrapping by selecting the option from the “Wrap Options” drop down menu.

*Note*  
To use the EXE wrapping feature or WiseScript Package Editor in AdminStudio, which is upgraded from the previous versions, it needs to be re-activated to acquire the license for using WiseScript Package Editor.
Wrap MSI/EXE Packages Using the Wrap Package Wizard

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Task To wrap msi/exe packages using the Wrap package wizard:

1. Select the Windows Installer (.msi) or installation package (.exe) package in the Application Catalog tree and select **Wrap Package** from the context menu.

   The Wrap Package Wizard screen appears.

2. Modify the **Install Parameters** and **Uninstall Parameters** and click **Next**.

   The Wrap Package Wizard screen appears.
3. On the Wrapper Type Selection, select the required wrapper types from the list and click **Next**.

4. Click **Browser** to select the location for the output directory.
5. Select **Edit script on wrapping** checkbox if you want to view the wise file in the **Wise Script Package Editor** tool and click **Next**.

The .wse file appears in the Wise Script Editor tool.

In AdminStudio, you can now edit the wrapped package too. You can select the Windows Installer (.msi) or installation package (.exe) package in the Application Catalog tree and select **Edit Wrapped Package** from the context menu.
**Note** - You will be able to view “Edit Wrapped Package” option in the context menu only if these (.ps1 and .exe) are wrapped packages.

You can also edit the wrapped package from the ribbon as well.

You can either view the Wise Script Editor tool from the Tools Gallery or Application Manager options.
Performing Application Conflict Testing

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

You can identify conflicts between packages in the Application Catalog using the Conflict Wizard. You can also check for conflicts between packages and OS Snapshots that have been imported into the Application Catalog.

Note • Conflict testing can be performed between Windows Installer packages, App-V packages, and OS snapshots in the Application Catalog; other deployment types—such as Citrix XenApp, VMware ThinApp, mobile apps, legacy applications, and web applications—are not supported.

ACE tests are used to detect conflicts between one or more source packages and one or more target packages/OS snapshots in the Application Catalog. Conflict evaluation is done for each source package against each target package.

For information about performing application conflict testing, see the following topics:

- Testing for Conflicts Between Packages
- Testing for Conflicts Between Packages and OS Snapshots

Note • In previous releases, the Conflict Wizard included a Conflict Rules panel where you could override the default conflict test selections for a specific execution of conflict testing. Starting in AdminStudio 11.5, this panel is no longer included in the Conflict Wizard. Each time you use the Conflict Wizard to perform conflict analysis, the default set of conflict tests will be run.
Performing Application Conflict Testing

For instructions on how to specify which ACE tests are executed during conflict testing, see Configuring Testing Options on the Analyze Tab and Selecting Tests to Execute.

**Note** • In previous releases, you were able to perform conflict analysis between external packages and packages in the Application Catalog. Starting in AdminStudio 11.5, you can no longer perform conflict testing using external packages; all packages must first be imported into the Application Catalog before conflict testing (or any other type of testing) can be performed.

Testing for Conflicts Between Packages

AdminStudio 2019 | Application Manager

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

To identify conflicts between packages or groups of packages in the Application Catalog, perform the following steps.

<table>
<thead>
<tr>
<th>Task</th>
<th>To identify conflicts between packages already in the Application Catalog:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open Application Catalog and select the Analyze tab of the ribbon.</td>
</tr>
<tr>
<td>2.</td>
<td>In the Application Catalog tree, select the source package (or group of packages) that you want to test and click the Conflict Wizard button in the ribbon (or right-click on the package and select Conflict Wizard from the shortcut menu). The Target Information panel of the Conflict Wizard opens.</td>
</tr>
<tr>
<td>3.</td>
<td>On the Target Information panel, select the packages or groups of packages that you want to use as the target in conflict analysis.</td>
</tr>
<tr>
<td>4.</td>
<td>Click Next. The Summary panel opens.</td>
</tr>
<tr>
<td>5.</td>
<td>Review the options selected in the Summary panel and click Finish to begin the conflict identification process. Testing is initiated and messages are displayed in the Output window. When testing is finished, a message appears in the Output window listing how many warnings and errors were generated.</td>
</tr>
<tr>
<td>6.</td>
<td>View the test results, as described in Viewing Application Conflicts Test Results.</td>
</tr>
<tr>
<td>7.</td>
<td>Resolve any issues that were detected, as described in Resolving Issues.</td>
</tr>
</tbody>
</table>
Testing for Conflicts Between Packages and OS Snapshots

To identify conflicts between packages and OS snapshots in the Application Catalog, perform the following steps.

1. Open the Application Catalog Environment tab and import an OS Snapshot into the Application Catalog, as described in Importing OS Snapshots.
2. Select the Analyze tab of the ribbon.
3. In the Application Catalog tree, select the source package (or group of packages) that you want to test and click the Conflict Wizard button in the ribbon (or select Conflict Wizard from the shortcut menu). The Target Information panel of the Conflict Wizard opens.
4. Select the packages or groups of packages that you want to use as the target in conflict analysis.
5. Click Next. The Target OS Snapshot Information panel opens.
6. Select the OS snapshots against which you want to compare the source package(s) for conflicts and click Next. The Summary panel opens.
7. Review the options selected in the Summary panel and click Finish to begin the conflict identification process. Testing is initiated and messages are displayed in the Output window. When testing is finished, a message appears in the Output window listing how many warnings and errors were generated.
8. View the test results, as described in Viewing Application Conflicts Test Results.
9. Resolve any issues that were detected, as described in Resolving Issues.

Performing Web Application Testing

AdminStudio 2019 | Application Manager

For web applications, the AdminStudio Enterprise Edition Application Compatibility add-on pack provides compatibility testing for Internet Explorer 11 and Microsoft Edge to ensure that applications delivered via browsers will function as expected.

Application Manager offers two types of testing for web applications:

- **Static analysis**—Application Manager runs a series of tests to determine the web application’s compatibility with Internet Explorer 11 and Microsoft Edge.

  **Note** • Starting with AdminStudio, browser compatibility testing for Internet Explorer 9 and 10 is no longer supported. However, if you are using an Application Catalog that has been upgraded from a previous version, browser compatibility test results for Internet Explorer 9 and 10 will still be displayed.

- **Dynamic analysis**—Application Catalog launches the web application in your browser. Then, as you perform tasks and navigate around the web application, Application Catalog records any warnings or errors that are encountered while using that version of the browser. You should always use dynamic testing when a web application requires a login to access.

The following table compares static and dynamic web application testing:

<table>
<thead>
<tr>
<th>Type</th>
<th>How to Launch</th>
<th>When to Use</th>
<th>What is Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static</td>
<td>Execute Tests</td>
<td>Use static analysis for web applications that do not require a login to access. If a web application does not require the user to login, static analysis is preferred because it is more thorough and automated.</td>
<td>Application Catalog crawls the web site and runs the selected browser compatibility tests on each page, up to the maximum number of links specified. See Performing Static Testing of Web Applications.</td>
</tr>
</tbody>
</table>

**Important** • If you attempt to perform static analysis of a web application that requires login, Application Catalog will not be able to test any of the pages other than the login page.

**Note** • The Maximum number of links to crawl option is specified on the Analyze tab of the Application Catalog Options dialog box. The default value is 10.
Performing Static Testing of Web Applications

AdminStudio 2019 | Application Manager

You can use the **Execute Tests** button in the Application Manager ribbon to statically test web applications for browser compatibility. You can test a single web application or a group of web applications simultaneously.

When you have a web application selected and you click the **Execute Tests** button, Application Catalog runs all of the selected browser compatibility tests in the **Operating System Compatibility Tests** category.

**Important** • When testing for a specific browser version compatibility, make sure that you are using that browser version when testing.

<table>
<thead>
<tr>
<th>Type</th>
<th>How to Launch</th>
<th>When to Use</th>
<th>What is Tested</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic</td>
<td>Launch Web Test</td>
<td>Use dynamic analysis for web applications that require a login to access.</td>
<td>Application Catalog runs the selected browser compatibility tests on each page of the web application that you visit. Each time the page loads, the page is retested. Testing ends when you close the browser window. See Performing Dynamic Testing of Web Applications.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can also use dynamic analysis to test web pages that are generated after the user provides input, such as when performing a search or submitting a form.</td>
<td></td>
</tr>
</tbody>
</table>

Table 15-6 • Static vs. Dynamic Testing of Web Applications

Performing Static Testing of Web Applications

AdminStudio 2019 | Application Manager

You can use the **Execute Tests** button in the Application Manager ribbon to statically test web applications for browser compatibility. You can test a single web application or a group of web applications simultaneously.

When you have a web application selected and you click the **Execute Tests** button, Application Catalog runs all of the selected browser compatibility tests in the **Operating System Compatibility Tests** category.

**Note** • You can also perform interactive testing of web applications using the **Launch Web Test** button in the ribbon. See Performing Web Application Testing and Performing Dynamic Testing of Web Applications.

**Tip** • Web applications are not automatically tested at import, even if the **Automatically Execute Tests After Import** option on the **Import Options** tab of the Application Catalog **Options** dialog box is selected.

To statically test web applications for browser compatibility with Internet Explorer 11 and Microsoft Edge performs the following steps:

**Task**

**To perform static browser compatibility testing of web applications:**

1. Configure the tests that you want to run by performing the steps in Configuring Testing Options on the Analyze Tab.
2. Open the **Analyze** tab of the Application Catalog **Options** dialog box, and set the **Maximum number of links to crawl** option to the desired number of links.

Application Catalog will crawl the pages of the web application and run the selected browser compatibility tests on each page, up to the maximum number of links specified. The default value is 10.
3. Open the **Analyze** tab of Application Manager.

4. Specify the web applications you want to test by selecting a web application or group in the tree.

5. Click **Execute Tests** in the ribbon. Testing is initiated and messages are displayed in the **Output** window. When testing is finished, **Completed testing package(s)** is displayed in the **Output** window.

6. View the test results, as described in *Viewing Operating System Compatibility Test Results*.

7. Manually resolve any issues that were detected, as described in the **Manual Fix** section of each test’s documentation, as described in *Browser Compatibility Tests*.

---

---

### Performing Dynamic Testing of Web Applications

**AdminStudio 2019 | Application Manager**

You can use the **Launch Web Test** button in the Application Manager ribbon to interactively test a web application for browser compatibility.

---

**Important** • **You should always use dynamic testing when a web application requires a login to access. If you attempt to perform static analysis of a web application that requires login, Application Catalog will not be able to test any of the pages other than the login page.**

When you select a web application in the tree and click the **Launch Web Test** button, the following occurs:

- **Web application is launched in default browser**—Application Catalog launches the web application in your default browser.

---

**Important** • **Make sure that the browser version that you want to test for compatibility** (Internet Explorer 11 and Microsoft Edge) **is installed and is set as your default browser.**

- **Navigate through web application**—As you navigate around the web application, Application Catalog records any warnings or errors that are encountered. Progress messages are displayed in the **Output** window.

- **Perform tasks using web application**—As you perform tasks, such as when performing a search or submitting a form, Application Catalog tests the pages that are generated by those actions.

- **Close browser to stop testing**—When you have visited all pages that you want to test, close the browser window, and Application Catalog will end the testing.

---

**Note** • **You can also perform static, automated testing of web applications using the **Execute Tests** button in the ribbon.** See *Performing Web Application Testing* and *Performing Static Testing of Web Applications*. 

---
**Tip** • Web applications are not automatically tested at import, even if the Automatically Execute Tests After Import option on the Import Options tab of the Application Catalog Options dialog box is selected.

To interactively test a web application for browser compatibility with Internet Explorer 11 and Microsoft Edge performs the following steps:

---

**Task**

To perform static browser compatibility testing of a web application:

1. Configure the tests that you want to run by performing the steps in Configuring Testing Options on the Analyze Tab.
2. Make sure that the browser version that you want to test for compatibility (Internet Explorer 11 and Microsoft Edge) is installed and is set as your default browser.
3. Open the Analyze tab of Application Manager.
4. Select one web application in the tree.
5. Click Launch Web Test in the ribbon. Application Catalog launches the web application in your default browser.
6. Begin to navigate around the web application. After each page loads, Application Catalog records any warnings or errors that are encountered. Progress messages are displayed in the Output window.

**Note** • As each page loads, Application Catalog begins testing. Links on each page do not become active until testing is complete on that page, so you may have to wait several seconds before proceeding.

7. Perform tasks using the web application, such as performing searches, submitting a form, or any other functionality that you want to test. Application Catalog tests the pages that are generated by those actions.
8. When you have visited all pages that you want to test, close the browser window. Application Catalog will end the testing.
9. Testing is initiated and messages are displayed in the Output window. When testing is finished, Completed testing package(s) is displayed in the Output window.
10. View the test results, as described in Viewing Operating System Compatibility Test Results.
11. Manually resolve any issues that were detected, as described in the Manual Fix section of each test’s documentation, as described in Browser Compatibility Tests.

Integrating Analyze With Other Applications

AdminStudio 2019 | Application Manager

You can integrate Application Catalog Analyze with your Microsoft ACT (Application Compatibility Toolkit) database and display ACT test results. ACT is used to create an inventory of an organization’s installed applications, computers, and devices, and to identify and resolve compatibility issues.

- Integrating with Microsoft Application Compatibility Toolkit (ACT)

Integrating with Microsoft Application Compatibility Toolkit (ACT)

AdminStudio 2019 | Application Manager

You can integrate Application Catalog Analyze with your Microsoft ACT (Application Compatibility Toolkit) database and display ACT test results. ACT is used to create an inventory of an organization’s installed applications, computers, and devices, and to identify and resolve compatibility issues.

To enable AdminStudio to display data from your Microsoft ACT database in Analyze views and reports, perform the following steps.

**Task** To view Microsoft ACT data in Analyze views and reports:

1. Enter connection information for your Microsoft ACT database on the **Microsoft ACT** tab of the Application Catalog **Options** dialog box, as described in Entering Microsoft ACT Database Connection Settings.

2. Open the **Analyze** tab.

3. Select a package in the tree that also has associated information in the ACT Database. The **Analyze Deployment Type View** opens.

4. Open the **ACT Summary** tab. Results from the ACT database are displayed on this tab.

5. Open the **Reports** tab.

6. Under **Application Catalog Dashboards** in the ribbon, select **Microsoft Application Compatibility Toolkit**. The **Microsoft Application Compatibility Toolkit Assessment** displays.
Chapter 15 Using Analyze to Perform Package Testing

Viewing and Filtering Test Results

7. Review these results, as described in the Microsoft ACT documentation.

Note • For more information, see Microsoft Application Compatibility Toolkit at:

Microsoft Application Compatibility Toolkit Assessment

This report lists the results of Microsoft ACT application compatibility testing, per operating system and application. Each row in this report lists the status assigned to an application after it was tested for compatibility on a specific operating system. You can compare the status recorded in your ACT database to the status assigned by the ACT community.

Note: If you want the test results in your Microsoft ACT database to be displayed in this report, enter the database.

Viewing and Filtering Test Results

AdminStudio 2019 | Application Manager

All Application Catalog test results are viewed on the Analyze tab. In Analyze views, groups, applications, and packages are assigned a test status in each test group using status icons.

- **Package status**—For packages, the status icon identifies that package’s test status.
- **Group/application status**—For groups and applications, Analyze considers all of the packages in that group or application, and displays the status icon for the package that has the status at the highest hierarchical level, as described in Hierarchical Level of Status Icons.

For detailed information about viewing and filtering test results, see the following topics:

- **About Status Icons**
- **Viewing Summary Group/Application Test Results**
- **Viewing Detailed Package Test Results**
  - **Viewing Summary Test Results**
  - **Viewing Operating System Compatibility Test Results**
  - **Viewing Browser Compatibility Test Results**
  - **Viewing Application Virtualization Compatibility Test Results**
  - **Viewing Remote Application Publishing Compatibility Test Results**
  - **Viewing Best Practices Test Results**
  - **Viewing Application Conflicts Test Results**
About Status Icons

AdminStudio 2019 | Application Manager

In Analyze views, groups, applications, and packages are assigned a test status in each test group using status icons. For packages, the status icon identifies that package’s test status. For groups and applications, Analyze considers all of the packages in that group or application, and displays the status icon for the package that has the status at the highest hierarchical level, as described in Hierarchical Level of Status Icons.

• Status Icons Displayed in the Supportability Risks Columns
• Hierarchical Level of Status Icons

Status Icons Displayed in the Supportability Risks Columns

The following status icons are displayed in the Supportability Risks columns of the Analyze Application/Group views.

Table 15-7 • Status Icons Used in Supportability Risks Columns of Analyze Views

<table>
<thead>
<tr>
<th>Level</th>
<th>Icon</th>
<th>Name</th>
<th>Tested?</th>
<th>Error/Warning Status</th>
</tr>
</thead>
</table>
| 1     | ![Error Icon](Error Icon.png) | Error With Fix       | Yes     | • **Errors**—One or more were generated, but at least one has an automated fix which has not yet been applied. See Performing Automatic Issue Resolution.  
• **Warnings**—One or more could have been generated. |
| 2     | ![Error Icon](Error Icon.png) | Error                | Yes     | • **Errors**—One or more were generated, and none of them has an automated fix.  
• **Warnings**—One or more could have been generated. |
| 3     | ![Warning Icon](Warning Icon.png) | Warning With Fix     | Yes     | • **Errors**—None generated.  
• **Warnings**—One or more were generated, but at least one has an automated fix which has not yet been applied. See Performing Automatic Issue Resolution. |
| 4     | ![Warning Icon](Warning Icon.png) | Warning              | Yes     | • **Errors**—None generated.  
• **Warnings**—One or more were generated, and none of them has an automated fix. |
| 5     | ![Ready Icon](Ready Icon.png) | Ready With Suppressed Error(s) | Yes | • **Errors**—One or more were generated, but all have been suppressed, as described in Filtering Test Results by Suppressing Errors/Warnings.  
• **Warnings**—One or more could have been generated. |
Note • The Error With Fix and Warning With Fix statuses are considered at a higher level than their Error/Warning counterparts to indicate that there is an action that you can take (performing automated issue resolution) to alter the final test status of those packages.

Hierarchical Level of Status Icons

In the previous table, the Level column identifies each icon’s hierarchical level. To determine which status icon should be displayed for a group or an application, Analyze considers all of the packages in that group or application, and displays the status icon with the highest hierarchical level.

For example, if all of the packages in a group were tested except one, then that group would have a status icon of Not Run (level 1). If five packages in a group had no errors or warnings (meaning it they had the Ready status, which is level 8), but one contained a warning (level 5), that group would be assigned a status icon of Warning.
Here are a few more examples that are displayed in the Example of Hierarchical Level of Status Icons figure:

- In the Operating System Compatibility column, the Support group is assigned an overall test status of Error With Fix (level 2) because that is the highest level test status of all of the packages in that group (Warning With Fix is level 4, while Warning is level 5, and Not Applicable is level 9).

- In the Application Conflicts column, the Support group is assigned an overall test status of Not Run, because at least one package in that group has a test status of Not Run (level 1), which is the highest level test status.

- The Picasa application contains two packages: a Windows Installer package and an App-V package. In the Best Practices column, the Picasa application is assigned the overall test status of its Windows Installer package (Error With Fix) instead of the status of its App-V package (Error) because Error With Fix is level 2, while Error is level 3.

Viewing Summary Group/Application Test Results

Analyze provides summary views that show display a status icon for groups and applications to indicate their overall test status in each of the following categories:

- Operating System Compatibility
- Browser Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
From these views—**Analyze Group View** and **Analyze Application View**—you can drill-down to access individual package test results on the **Analyze Deployment Type View**, as described in Viewing Detailed Package Test Results.

To view group and application summary test results, perform the following steps.

**Task**

2. Open the **Analyze** tab and select a group in the tree.

**Tip** • To view test results for the entire Application Catalog, select the root group in the tree (which is **Applications** by default).

The **Analyze Group View** opens and displays icons to indicate the overall test status of applications and/or subgroups, as described in **About Status Icons**, in each of the following columns:

- Operating System Compatibility
- Browser Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
- Best Practices
- Risk Assessment
- Application Conflicts

3. In the **Analyze Group View**, you can expand a subgroup node to view its applications, and can expand an application node to view its packages.

A status icon is displayed in each of the columns to indicate the test status of the tests in that category for the group, application, or package. All of the columns on this view are sortable by clicking on the column heading.
4. To view the status of a single application’s packages, select the application in the tree. The **Analyze Application View** opens.

![Analyze Application View](image)

5. To open the **Analyze Deployment Type View** to see the detailed test results for a single package, do one of the following:
   - Select the package in the Application Catalog tree.
   - Double-click the package on the **Analyze Application View**.

## Viewing Detailed Package Test Results

**AdminStudio 2019 | Application Manager**

Detailed test results for individual packages can be viewed on the **Analyze Deployment Type View** and its subtabs:

- Operating System Compatibility
- MSIX Conversion Compatibility
- Browser Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
- Best Practices
- Risk Assessment
- Application Conflicts

For information on viewing test results for an individual package, see the following topics:

- Viewing Summary Test Results
- Viewing Operating System Compatibility Test Results
- Viewing MSIX Conversion Compatibility Test Results
- Viewing Browser Compatibility Test Results
- Viewing Application Virtualization Compatibility Test Results
- Viewing Remote Application Publishing Compatibility Test Results
- Viewing Best Practices Test Results
- Viewing Application Conflicts Test Results
Viewing Summary Test Results

AdminStudio 2019 | Application Manager

By clicking on each of the test category in the Supportability Risks column in the Analyze Deployment Type View lists detailed test totals for each test group and test category, including the number of:

- Tests executed
- Errors and warnings generated
- Errors and warnings for which an auto fix is available
- Errors and warnings that are suppressed

Also, a status icon identifies the package's test status in each of the test groups and test categories.

Task  To view summary test results:

1. Select the Analyze tab in the Application Manager ribbon.
2. Select a package in the tree. The Supportability Risks column of the Analyze Deployment Type View opens.
The following information is displayed for each test group and test category:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Executed</strong></td>
<td>Number of tests executed in that test group or test category. This number corresponds to the number of tests selected in that test group/category on the <strong>Select Tests to Execute</strong> dialog box.</td>
</tr>
<tr>
<td><strong>Errors</strong></td>
<td>Number of non-suppressed errors generated in that test group/category. See <strong>Filtering Test Results by Suppressing Errors/Warnings</strong>.</td>
</tr>
<tr>
<td><strong>Warnings</strong></td>
<td>Number of non-suppressed warnings generated in that test group/category. See <strong>Filtering Test Results by Suppressing Errors/Warnings</strong>.</td>
</tr>
</tbody>
</table>
Viewing and Filtering Test Results

3. To view more detailed results, proceed as described in one of the following topics:
   - Viewing Operating System Compatibility Test Results
   - Viewing MSIX Conversion Compatibility Test Results
   - Viewing Application Virtualization Compatibility Test Results
   - Viewing Remote Application Publishing Compatibility Test Results
   - Viewing Best Practices Test Results
   - Viewing Application Conflicts Test Results

**Viewing Operating System Compatibility Test Results**

AdminStudio 2019 | Application Manager

The *Operating System Compatibility* tab of the *Analyze Deployment Type View* lists all of the individual errors and warnings that were generated by tests in the *Operating System Compatibility* test group for the package.

On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in *Filtering Test Results by Suppressing Errors/Warnings*.

<table>
<thead>
<tr>
<th>Task</th>
<th>To view operating system compatibility test results:</th>
</tr>
</thead>
<tbody>
<tr>

<td>For more information, see Filtering Test Results by Suppressing Errors/Warnings.</td>
</tr>
</tbody>
</table>

6. For more detailed information on Operating System Compatibility tests and the issues that they generate, including information on how to resolve these issues, see Operating System Compatibility Tests.

Tip • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Operating System Compatibility tab and selecting More Info from the shortcut menu.
Viewing MSIX Conversion Compatibility Test Results

AdminStudio 2019 | Application Manager

You can view all of the individual errors and warnings that were generated by tests in the MSIX Conversion Compatibility test group on the Supportability Risks tab of the Analyze Deployment Type View.

If you click on the icon displayed in the MSIX Conversion Compatibility area of the Summary view of the Supportability Risks tab, a detailed view opens where you can read all of the error and warning messages that were generated.

**Task**

*To view MSIX Conversion compatibility test results:*

1. Perform testing, as described in Performing Compatibility, Best Practices, and Risk Assessment Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a package in the tree. The Summary view of the Supportability Risks tab of the Analyze Deployment Type View opens.
4. Open the MSIX Conversion Compatibility test group and click on the Desktop entry. A detailed view of the Supportability Risks tab opens, listing the errors and warnings generated by the MSIX Conversion Compatibility test group.

Viewing Browser Compatibility Test Results

AdminStudio 2019 | Application Manager

The Browser Compatibility tab of the Analyze Deployment Type View lists all of the individual errors and warnings that were generated by tests in the Browser Compatibility test group for web applications.
On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in Filtering Test Results by Suppressing Errors/Warnings.

**Task**

To view browser compatibility test results:

1. Perform testing, as described in Performing Web Application Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a web application in the tree. The Summary tab of the Analyze Deployment Type View opens.
4. Select the Browser Compatibility tab. The errors and warnings generated by tests in the Browser Compatibility test group are listed.

The following information is displayed:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Category</td>
<td>Name of test category in the Browser Compatibility Test test group for which errors or warnings were generated. When this test category is expanded, the tests in that category that generated errors or warnings are listed.</td>
</tr>
<tr>
<td>Test Number and Name</td>
<td>For each test, the number and name is listed in bold, followed by a description. When the test is expanded, the errors or warnings generated by this test are listed; these error/warning messages list information specific to the package that explains why the error or warning was generated.</td>
</tr>
</tbody>
</table>
Chapter 15  Using Analyze to Perform Package Testing

Viewing and Filtering Test Results

5. For more detailed information on Browser Compatibility tests and the issues that they generate, including information on how to resolve these issues, see Browser Compatibility Tests.

Tip • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Browser Compatibility tab and selecting More Info from the shortcut menu.

Viewing Application Virtualization Compatibility Test Results

AdminStudio 2019 | Application Manager

Application Catalog performs application virtualization compatibility testing to determine if a Windows Installer package is a suitable candidate for conversion to Microsoft App-V, Citrix XenApp, VMware ThinApp.

The Application Virtualization Compatibility tab of the Analyze Deployment Type View lists all of the individual errors, warnings, and informational messages that were generated when application virtualization compatibility testing was performed.

Note • See also Application Virtualization Compatibility Status: Analyze vs. Automated Application Converter.
**Task**

**To view application virtualization compatibility test results:**

1. Perform testing, as described in Performing Compatibility, Best Practices, and Risk Assessment Testing.

   **Note** - The Application Virtualization Compatibility tests are always run any time that you run tests in Analyze. However, the selections you make on the **Select Tests to Execute** dialog box determine which virtual formats to display in test results.

2. Select the **Analyze** tab in the Application Manager ribbon.

3. Select a package in the tree. The **Summary** tab of the **Analyze Deployment Type View** opens.

4. Select the **Application Virtualization Compatibility** tab. The errors and warnings generated by application virtualization compatibility testing are listed.

   ![Screenshot of Application Virtualization Compatibility test results]

   **Summary**

<table>
<thead>
<tr>
<th>Test Category</th>
<th>Overall Assessment</th>

<td>![Symbol]</td>
</tr>
<tr>
<td>Citrix XenApp Profile</td>
<td>![Symbol]</td>
</tr>
</tbody>
</table>

   The following information is displayed:

   **Property** | **Description**
   --------------|--------------------------------------------------
   Test Category  | Identifies the test category as one of the following virtualization technologies:
   - Microsoft App-V 4.x
   - Microsoft App-V 5.x
   - VMware ThinApp 4.x
   - VMware ThinApp 5.x
   - Citrix XenApp

   When each test category is expanded, the tests in that category that generated errors or warnings are listed.
5. For more detailed information on the issues generated by Application Virtualization Compatibility tests, including information on how to resolve these issues, see Application Virtualization Compatibility Tests.
Application Virtualization Compatibility Status: Analyze vs. Automated Application Converter

AdminStudio 2019 | Application Manager

AdminStudio’s Automated Application Converter is used to convert packages to a virtual format. When a package is added to its Packages tab, Automated Application Converter does its own check to identify that package’s virtualization readiness status and assigns it one of the following statuses (which are slightly different than the statuses assigned by Analyze):

Table 15-8 • Automated Application Converter Package Statuses

<table>
<thead>
<tr>
<th>Status</th>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>✅</td>
<td>Package is ready to virtualize; no repackaging is required. If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the IniFile table, which changes files on the target machine in ways that cannot be statically determined.</td>
</tr>
<tr>
<td>Requires repackaging</td>
<td>🚨</td>
<td>Package must be repackaged before it can be successfully virtualized.</td>
</tr>
<tr>
<td>Virtualization not supported</td>
<td>🚫</td>
<td>Automated Application Converter has determined that virtualization is not supported.</td>
</tr>
<tr>
<td>Virtualization not recommended</td>
<td>⚠️</td>
<td>Automated Application Converter has determined that this package is not recommended for virtualization.</td>
</tr>
<tr>
<td>Unknown</td>
<td>❓</td>
<td>The Automated Application Converter was unable to determine whether this package is ready to be virtualized directly or whether it requires repackaging.</td>
</tr>
</tbody>
</table>

The following table explains how the Application Catalog application virtualization compatibility package statuses of Ready, Not Ready, and Fixable Issues correspond to statuses assigned to individual packages when they are added to Automated Application Converter:

Table 15-9 • Application Virtualization Compatibility Status: Analyze vs. Automated Application Converter

<table>
<thead>
<tr>
<th>Analyze Status</th>
<th>Automated Application Converter Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ready</td>
<td>Ready</td>
<td>Package is ready to virtualize; no repackaging is required.</td>
</tr>
<tr>
<td>Requires repackaging</td>
<td></td>
<td>Package must be repackaged before it can be successfully virtualized.</td>
</tr>
</tbody>
</table>

Note • If a Windows Installer package does not contain any custom actions, conditional components, or unsupported tables, repackaging prior to virtualization is not required. An example of an unsupported table is the IniFile table, which changes files on the target machine in ways that cannot be statically determined.
Table 15-9 • Application Virtualization Compatibility Status: Analyze vs. Automated Application Converter

<table>
<thead>
<tr>
<th>Analyze Status</th>
<th>Automated Application Converter Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Ready (Error)</td>
<td>Virtualization not supported</td>
<td>Virtualization is not supported due to one of the following issues:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package contains DLL surrogates.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package installs boot services.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package contains OS integrated files.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package relies on a system-level driver.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package’s .sft file name is over 56 characters in length.</td>
</tr>
<tr>
<td></td>
<td>Virtualization not recommended</td>
<td>This package is not recommended for virtualization due to one of the following issues:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package includes a custom shell extension.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Package utilizes ClickOnce technology.</td>
</tr>
<tr>
<td>Fixable Issues (Warning)</td>
<td>Virtualization not recommended</td>
<td>This package is not recommended for virtualization because it does not contain a shortcut.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>It is possible to resolve this issue by manually creating a shortcut in the package before performing conversion.</td>
</tr>
</tbody>
</table>

**Important** • Packages with a status of Virtualization not supported will not be virtualized in Automated Application Converter. In order to virtualize the package, you must first override the status and change it to Ready or Requires repackaging.

**Important** • For more information, see Application Virtualization Compatibility Tests.

**Note** • For more information, see Application Virtualization Compatibility Tests.

**Note** • For more information, see Application Virtualization Compatibility Tests.
Viewing Remote Application Publishing Compatibility Test Results

AdminStudio 2019 | Application Manager

The Remote Application Publishing Compatibility tab of the Analyze Deployment Type View lists all of the individual errors and warnings that were generated by tests in the Remote Desktop Services Tests test group for the package.

On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in Filtering Test Results by Suppressing Errors/Warnings.

Task

To view remote application publishing compatibility test results:

1. Perform testing, as described in Performing Compatibility, Best Practices, and Risk Assessment Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a package in the tree. The Summary tab of the Analyze Deployment Type View opens.
4. Select the Remote Application Publishing Compatibility tab. The errors and warnings generated by tests in the Remote Desktop Services Tests test group are listed.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Category</td>
<td>Name of test category for which errors or warnings were generated.</td>
</tr>
<tr>
<td></td>
<td>When this test category is expanded, the tests in that category that generated errors or warnings are listed.</td>
</tr>
<tr>
<td>Test Number</td>
<td>For each test, the number is listed in bold, followed by a description.</td>
</tr>
<tr>
<td></td>
<td>When the test is expanded, the errors or warnings generated by this test are listed; these error/warning messages list information specific to the package that explains why the error or warning was generated.</td>
</tr>
</tbody>
</table>
Chapter 15  Using Analyze to Perform Package Testing

Viewing and Filtering Test Results

5. For more detailed information on the issues generated by Remote Application Publishing Compatibility tests, including information on how to resolve these issues, see Remote Application Publishing Compatibility Tests.

Tip • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Remote Application Publishing Compatibility tab and selecting More Information from the shortcut menu.

Viewing Best Practices Test Results

AdminStudio 2019 | Application Manager

The Best Practices tab of the Analyze Deployment Type View lists all of the individual errors and warnings that were generated by tests in the Best Practices test group for the package.

On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in Filtering Test Results by Suppressing Errors/Warnings.

Task  To view Best Practices test results:

1. Perform testing, as described in Performing Compatibility, Best Practices, and Risk Assessment Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a package in the tree. The **Summary** tab of the **Analyze Deployment Type View** opens.

4. Select the **Best Practices** tab. The errors and warnings generated by tests in the Best Practices test group are listed.

The following information is displayed:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Test Category</strong></td>
<td>Name of test category in the <strong>Best Practices</strong> test group for which errors or warnings were generated. When this test category is expanded, the tests in that category that generated errors or warnings are listed.</td>
</tr>
<tr>
<td><strong>Test Number</strong></td>
<td>For each test, the number is listed in bold, followed by a description. When the test is expanded, the errors or warnings generated by this test are listed; these error/warning messages list information specific to the package that explains why the error or warning was generated.</td>
</tr>
<tr>
<td><strong>Count</strong></td>
<td>Two counts are listed:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Test category count</strong>—Total number of errors/warnings that were generated by all of the tests in the test category for the selected package.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Test count</strong>—Total number of errors/warnings that were generated by the specific test for the selected package.</td>
</tr>
<tr>
<td><strong>Icon</strong></td>
<td>For each error or warning, one of the following icons is displayed:</td>
</tr>
<tr>
<td></td>
<td>- Error</td>
</tr>
<tr>
<td></td>
<td>- Error With Fix</td>
</tr>
<tr>
<td></td>
<td>- Warning</td>
</tr>
<tr>
<td></td>
<td>- Warning With Fix</td>
</tr>
</tbody>
</table>

For more information, see *About Status Icons*. 
For more detailed information on the issues generated by Best Practices tests, including information on how to resolve these issues, see Best Practices Tests.

**Tip** • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Best Practices tab and selecting More Information from the shortcut menu.

### Viewing Risk Assessment Test Results

The Risk Assessment tab of the Analyze Deployment Type View lists all of the individual errors and warnings that were generated by tests in the Risk Assessment test group for the package.

On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in Filtering Test Results by Suppressing Errors/Warnings.

**Task**

To view Risk Assessment test results:

1. Perform testing, as described in Performing Compatibility, Best Practices, and Risk Assessment Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a package in the tree. The Summary tab of the Analyze Deployment Type View opens.
4. Select the Risk Assessment tab. The errors and warnings generated by tests in the Risk Assessment test group are listed.

The following information is displayed:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Category</td>
<td>Name of test category in the Risk Assessment test group for which errors or warnings were generated. When this test category is expanded, the tests in that category that generated errors or warnings are listed.</td>
</tr>
</tbody>
</table>
Chapter 15  Using Analyze to Perform Package Testing

Viewing and Filtering Test Results

5. For more detailed information on the issues generated by Risk Assessment tests, including information on how to resolve these issues, see Risk Assessment Tests.

Tip • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Risk Assessment tab and selecting More Information from the shortcut menu.

Viewing Application Conflicts Test Results

AdminStudio 2019 | Application Manager

The Application Conflicts tab of the Analyze Deployment Type View lists all of the individual errors and warnings that were generated by tests in the Application Conflicts test group for the package when conflict analysis was performed.

On this tab, you can read the detailed error and warning messages, and can choose to suppress any errors or warnings that you feel are not important at your organization, as described in Filtering Test Results by Suppressing Errors/Warnings.
Task To view application conflict test results:

1. Perform conflict analysis, as described in Performing Application Conflict Testing.
2. Select the Analyze tab in the Application Manager ribbon.
3. Select a package in the tree. The Summary tab of the Analyze Deployment Type View opens.
4. Select the Application Conflicts tab. The errors and warnings generated by tests in the Application Conflicts test group are listed.

![Application Conflicts Summary View](image)

The following information is displayed:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Category</td>
<td>Name of test category in the Application Conflicts test group for which errors or warnings were generated. When this test category is expanded, the tests in that category that generated errors or warnings are listed.</td>
</tr>
<tr>
<td>Test Number</td>
<td>For each test, the number is listed in bold, followed by a description. When the test is expanded, the errors or warnings generated by this test are listed; these error/ warning messages list information specific to the package that explains why the error or warning was generated.</td>
</tr>
<tr>
<td>Count</td>
<td>Two counts are listed:</td>
</tr>
<tr>
<td></td>
<td>• Test category count—Total number of errors/warnings that were generated by all of the tests in the test category for the selected package.</td>
</tr>
<tr>
<td></td>
<td>• Test count—Total number of errors/warnings that were generated by the specific test for the selected package.</td>
</tr>
</tbody>
</table>
5. For more detailed information on the issues generated in by Application Conflicts tests, including information on how to resolve these issues, see Application Conflicts Tests.

Tip • You can also quickly access detailed test information directly from the Analyze interface by right-clicking on the test on the Application Conflicts tab and selecting More Information from the shortcut menu.

Viewing Combined Test Results of Bundled Packages

When a complex installer executable (.exe), Apple disk image package (.dmg), or Apple installer package (.pkg) file is tested, its bundled packages are also tested and the test results are combined and displayed in Analyze.

• Viewing Combined Test Results of Child Windows Installer Packages of Complex Installer Executables
• Viewing Combined Test Results of Child Applications of PKG and DMG Installers

Figure 17: Combined Suite Installer Test Results
Viewing Combined Test Results of Child Applications of PKG and DMG Installers

AdminStudio 2019 | Application Manager

If an Apple installer package (.pkg) or disk image (.dmg) contains child packages bundled within it, those child packages are also tested when the parent package is tested. Test results of the parent package and all of its child packages are combined and are displayed in Analyze.

![Consolidated Test Results for Apple Installer Package (.pkg)](image)

**Figure 18:** Consolidated Test Results for Apple Installer Package (.pkg)

When you view detailed test results, the name of the child .pkg, .dmg, or .app file that generated the error or warning is listed.

![Detailed Consolidated Test Results for Apple Installer Package (.pkg)](image)

**Figure 19:** Detailed Consolidated Test Results for Apple Installer Package (.pkg)
Filtering Test Results by Suppressing Errors/Warnings

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

If you do not want Analyze to include the issues generated by a particular test in the overall package status, and you do not want them included in summary issue counts, you can choose to suppress that test by clicking the Suppress (ON/OFF) button on the following tabs of the Analyze Deployment Type View:

- Operating System Compatibility
- Browser Compatibility
- Best Practices
- Risk Assessment
- Application Conflicts

When you suppress a test, its Suppress button switches from its ON state:

![Suppressed Test](image)

...to its OFF state, and its error or warning icon switches to gray:

![Suppressed Test](image)

You may choose to suppress the test results of a test that generates known issues at your organization which do not need additional corrections.

When a test is suppressed, the following occurs:

- **Errors/warnings not included in summary totals**—The test’s issues are no longer included in the overall Errors and Warnings counts on Summary tab of the Analyze Deployment Type View. Instead, they are listed on the Issues Suppressed column.
- **Test’s status is ignored in overall status**—The test’s status is ignored when assigning an overall status to a package.
- **Test’s issues are not fixed**—Issues generated by suppressed tests are not resolved during automatic issue resolution even if an auto-fix exists.

**Note** • Even though the test is suppressed, it is still run each time testing is performed. The only way to turn off the execution of a test is to deselect it on the Select Tests to Execute dialog box.

To suppress a test’s issues, perform the following steps:
Task: To suppress the errors and warnings for a test:

1. Select the **Analyze** tab in the Application Manager ribbon.
2. Select a package in the tree. The **Summary** tab of the **Analyze Deployment Type View** opens.
3. Select the tab of the **Analyze Deployment Type View** that contains the issues that you want to suppress.
4. Next to the name of the test that has generated issues that you want to suppress, click its **Suppress** button. The button will switch from its ON state to its OFF state, and its error or warning icon will switch to gray:

5. Open the **Summary** tab of the **Analyze Deployment Type View**, and notice that the count in the **Issues Suppressed** column for that test category has been increased.

Resolving Issues

Some of the tests in the **Operating System Compatibility**, **Browser Compatibility**, **Best Practices**, **Risk Assessment**, and **Application Conflicts** tests groups have automatic fixes available, and can be automatically fixed—via transform—by clicking the **Resolve Issues** button in the ribbon. For other tests, a manual fix is required.

For information on resolving issues generated by Analyze testing, see the following topics:

- Performing Automatic Issue Resolution
- Performing Manual Issue Resolution

Performing Automatic Issue Resolution

Some of the tests in the **Operating System Compatibility**, **Browser Compatibility**, **Best Practices**, **Risk Assessment**, and **Application Conflicts** tests groups have automatic fixes available, and can be automatically fixed—via transform—by clicking the **Resolve Issues** button in the ribbon.

- About Automatic Issue Resolution
- Automatically Resolving Issues
- Issue Resolution and the Software Repository
About Automatic Issue Resolution

If an error or warning that was generated for a package has an automatic fix available, it is assigned one of the following icons:

Table 15-10 • Status Icons Indicating Auto-Fix Available

<table>
<thead>
<tr>
<th>Icon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error With Fix</td>
<td></td>
</tr>
<tr>
<td>Warning With Fix</td>
<td></td>
</tr>
</tbody>
</table>

To determine whether a test has an associated auto fix, review the Resolution section in the description of the test in the Analyze Tests section of the documentation.

For some of the tests in the Operating System Compatibility and Browser Compatibility test groups, you have the option of specifying how you want Application Catalog to resolve automatically resolvable issues. You can instruct Application Catalog to perform the basic auto fix, the advanced auto fix, or not to fix issues generated by the test.

Table 15-11 • Default Fix Options

<table>
<thead>
<tr>
<th>Fix Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not resolve this issue automatically</td>
<td>Select this option if you do not want Application Catalog to automatically resolve any issues generated by this test.</td>
</tr>
</tbody>
</table>
| Apply the basic auto fix              | Select this option if you want Application Catalog to resolve issues generated by this test by applying the basic auto fix.  
                                           Applying the basic auto fix is relatively safe. It results in minimal changes to an MSI package via a Windows Installer transform. It does not change the target system’s security or a system policy. |
| Apply the advanced auto fix           | Select this option if you want Application Catalog to resolve issues generated by this test by applying the advanced auto fix.  
                                           Applying the advanced auto fix may result in a loss of functionality, and it may not resolve all types of issues. This type of fix may change the target system’s security or a system policy. One example of an advanced auto fix is the removal of a registry key that is protected by Windows Resource Protection. |

Note • For some tests, one of these options is disabled. For others, all options are disabled.

For information on how to specify whether to perform a basic or advanced auto fix for a test, see Setting Automatic Fix Preferences for Operating System Compatibility and Browser Compatibility Tests.
Automatically Resolving Issues

To perform automatic issue resolution, perform the following steps:

**Task**

**To perform automatic issue resolution:**

1. Select the **Analyze** tab in the Application Manager ribbon.
2. Select a group, application, or package in the tree to open the **Analyze Group View**, **Application View**, or **Deployment Type View**.
3. Review the icons on these views to determine if any test categories are assigned the **Error With Fix** or **Warning With Fix** status icon. In this example, the **Error With Fix** icon is displayed:

![Analyze Group View](image)

4. To automatically resolve issues in the selected package, or in the packages in the selected application or group, click the **Resolve Issues** button (or click **F7**):

Issue resolution begins, progress messages appear in the Output window, and Application Catalog performs the following tasks:

- **Reruns tests**—Application Catalog reruns all of the selected tests to ensure that the issues that it is going to resolve still exist in the current version of the package and its associated transforms.

- **Creates transform files**—To resolve issues, Application Catalog generates the following fix transform files:
  
  ```
  PackageName_AS_Fixed.mst
  PackageName_AS_Conflicts.mst
  ```

  The file ending in **AS_Fixed.mst** fixes operating system compatibility issues, while the file ending in **AS_Conflicts.mst** fixes conflict and Windows best practices and mobile app risk assessment issues.

- **Reimports packages**—Application Catalog then automatically reimports each package and its fix transform files into the Application Catalog.

5. When issue resolution and reimporting is complete, look at the **Analyze Group View**, **Application View**, or **Deployment Type View** of the package, application, or group that you tested. You will see that the Error With Fix and Warning With Fix icons have been replaced with the status icon with the next highest level (as described in [Hierarchical Level of Status Icons](#)) in that test category.
Chapter 15  Using Analyze to Perform Package Testing

Resolving Issues

6. Open the Application Catalog **Home** tab and select one of the fixed packages in the tree. You will notice that in the **Transforms** property on the **Package Information** tab of the **Home Deployment Type View**, the name of the fix transform is now listed, such as:

   This product has 2 transforms.
   (C:\Applications\AdobeAcrobat9\AdobeAcrobat9_AS_Fixed.mst
   C:\Applications\AdobeAcrobat9\AdobeAcrobat9_SoftwareId.mst)

**Issue Resolution and the Software Repository**

When you attempt to automatically resolve issues for a package in the Software Repository, Application Catalog will automatically check out the package, create the fix transform, reimport the package and transform, and check the package back in. However, if the package is already checked out by someone else, Application Catalog will be unable to perform the auto fix.

- Analyze Tests
- About Analyze Tests

**Performing Manual Issue Resolution**

**AdminStudio 2019 | Application Manager**

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

Due to their complexity, some conflicts require manual resolution using InstallShield Editor or the Virtual Package Editor.

To perform manual issue resolution for Windows Installer or App-V packages, perform the following steps.

**Task**  
**To perform manual issue resolution:**

1. Perform testing, as described in **Performing Compatibility, Best Practices, and Risk Assessment Testing** and **Performing Application Conflict Testing**.

2. Perform automatic issue resolution, as described in **Performing Automatic Issue Resolution**.

3. Open the **Analyze** tab, and select a package in the tree. The **Summary** tab of the **Analyze Deployment Type View** opens.

4. Open the tab of the test group that contains an issue that you want to resolve.

5. Locate the test that contains an issue that you want to resolve, and expand it to display the errors or warnings were generated by this test:

<table>
<thead>
<tr>
<th>MAC101 - Deprecated Property List Keys: The Mac package is scanned for the deprecated property list keys</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdobePDFViewer.plugin contains reference(s) to deprecated property list key(s) CFBundleGetInfoString.</td>
</tr>
<tr>
<td>AdobePDFViewer.PAPR.plugin contains reference(s) to deprecated property list key(s) CFBundleGetInfoString.</td>
</tr>
<tr>
<td>Adobe Reader.app contains reference(s) to deprecated property list key(s) CFBundleTypeExtensions, CFBundleTypeMIMETypes.</td>
</tr>
<tr>
<td>AcroEx.app contains reference(s) to deprecated property list key(s) CFBundleGetInfoString.</td>
</tr>
</tbody>
</table>
These error/warning messages list information specific to the package that explains why the error or warning was generated, such as the table name and/or the component name that is causing the issue.

6. Review the information in the error or warning message, and consult the Manual Fix subsection of this test's topic in About Analyze Tests.

7. If you determine that it is possible to manually resolve this issue, do one of the following:
   - **Windows Installer packages**—Open the package in InstallShield Editor and create a fix transform to resolve this issue.
   
   Note • For information on using InstallShield Editor, see Customizing and Authoring Installations Using InstallShield.

   - **Microsoft App-V packages**—Open the package in the Virtual Package Editor, as described in Using the Virtual Package Editor, and fix the issue.

   - **Microsoft App-V packages**—Open the package in the Virtual Package Editor and fix the issue.

8. After resolving the issue, delete the package from the Application Catalog, and then reimport the package (and, for Windows Installer packages, the fix transform file) into the Application Catalog.

9. Perform testing again to confirm that the fix resolved the issue.

Viewing Test Summary Reports on Reports Tab

AdminStudio 2019 | Application Manager

**Edition** • The Application Catalog Reports tab is included with AdminStudio Enterprise Edition.

AdminStudio uses Microsoft SQL Reporting Services to provide a wide array of summary reports that are available on the Reports tab. Many of these reports display Analyze test results. On most reports, you can click categories in the charts to open more detailed reports, and view information at the package and issue-level.

For more information, see Viewing Application Testing and Analysis Reports on the Reports Tab.

Analyze Reference

AdminStudio 2019 | Application Manager

**Edition** • Application Catalog, with Analyze, is included with AdminStudio Professional and Enterprise Editions.
This section contains information on the Application Catalog views, dialog boxes and wizards that are accessible when the **Analyze** tab is selected in the ribbon. This Application Catalog functionality is used when testing packages for best practices, conflicts, application virtualization compatibility, operating system compatibility, browser compatibility, and remote application publishing compatibility.

*Note* • For information on the Application Catalog interface, see *Application Manager Interface*.

Reference information is organized into the following areas:

**Table 15-12 • Conflict Analysis and Resolution Reference Organization**

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Analyze Views</strong></td>
<td>Views used when performing conflict analysis and resolution using Application Catalog are covered in this section.</td>
</tr>
<tr>
<td><strong>Analyze Dialog Boxes</strong></td>
<td>Specific help for dialog box used when performing conflict analysis and resolution is provided in this section.</td>
</tr>
<tr>
<td><strong>Analyze Wizards</strong></td>
<td>This section contains a panel-by-panel reference for wizards used to perform conflict analysis and resolution.</td>
</tr>
</tbody>
</table>

**Analyze Views**

*Edition* • *Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The following views are associated with performing conflict analysis on the Products tab in Application Catalog:

- Analyze Group View
- Analyze Application View
- Analyze Deployment Type View

**Analyze Group View**

*Edition* • *Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The **Analyze Group View** has two formats: standard list format and a graphical, pie chart view of the same data. You can toggle between the list and chart view by clicking the toggle button at the top right of the page:
On the Chart view, you can make selections from the drop down lists to filter each pie chart by various criteria: operating systems, virtual format, or dependencies type.

**Figure 15-1:** Analyze Group View - Pie Chart View

The list format of the **Analyze Group View**, which opens when you select a group in the tree, displays icons to indicate the overall test status of applications and/or subgroups, as described in **About Status Icons**, in each of the following columns:

- Operating System Compatibility
- MSIX Conversion Capability
- Browser Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
- Best Practices
- Risk Assessment
- Application Conflicts
Figure 15-2: Analyze Group View - List View

A status icon is displayed in each of the columns to indicate the test status of the tests in that category for the group, application, or package. All of the columns on this view are sortable by clicking on the column heading.

To view the detailed test results for a single package, select the package in the Application Catalog tree to open the Analyze Deployment Type View.

Analyze Application View

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

The Analyze Application View, which opens when you select an application in the tree, displays icons to indicate the overall test status of an application’s packages, as described in About Status Icons, in each of the following columns:

- Operating System Compatibility
- MSIX Conversion Compatibility
- Browser Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
- Best Practices
- Risk Assessment
- Application Conflicts
A status icon is displayed in each of the columns to indicate the test status of the tests in that category for the package. All of the columns on this view are sortable by clicking on the column heading.

To open the **Analyze Deployment Type View** to see the detailed test results for a single package, double-click the package.

### Analyze Deployment Type View

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

The **Analyze Deployment Type View**, which is displayed when you select a package in the tree, contains detailed test results for individual packages.

Information on the **Analyze Deployment Type View** is displayed on the following tabs:

- Supportability Risks

### Supportability Risks

The **Supportability Risks** tab displays a summary of test categories and corresponding overall assessment which are displayed in the following sections:

- Operating System Compatibility
- MSIX Conversion Compatibility
- Application Virtualization Compatibility
- Remote Application Publishing Compatibility
- Risk Assessment
- Best Practices
- Application Conflicts

A status icon, as described in **About Status Icons**, identifies the package's test status in each of the test groups and test categories.
When you click on an individual test on the **Supportability Risks** tab, you will see the detailed test results for that test.
Figure 15-5: Detailed Test Results on Supportability Risks Tab

Details about the test run are listed and the errors/warnings that were generated. Also, the following information is displayed:

Table 15-13 • Supportability Risks Properties

Analyze Subnode Views

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

The following views are opened by expanding a Windows Installer package node in the tree and selecting a subnode:

• Patch Impact View
• Associated Patches View

Patch Impact View

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

The Patch Impact View is displayed when you select the Patch Impacts node under a package in the tree on the Analyze tab.
Summary View

The information displayed on the **Patch Impact View** is dependent upon the selection made in the **Impact category** list. The **Summary View**, which is displayed when **Summary** is selected from the **Impact category list**, displays a list of patches for which there is patch impact data persisted against the product. The following information is displayed:

**Table 15-18 • Summary View Information**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Id</td>
<td>Number identifying this patch’s associated Microsoft Security Bulletin.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the patch file.</td>
</tr>
<tr>
<td>Title</td>
<td>Title of the patch.</td>
</tr>
<tr>
<td>Release Date</td>
<td>Date this patch was published by Microsoft.</td>
</tr>
</tbody>
</table>

**File Impacts View**

The **File Impacts View**, which is displayed when **File Impacts** is selected from the **Impact category** list and you have file impacts persisted, lists all impacts against this product or OS Snapshot and identifies the patch that caused the impact. If you double-click on one of the patches, the Patch View for that patch will open. The following information is displayed:

**Table 15-19 • File Impacts View Information**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the impact.</td>
</tr>
<tr>
<td>Id</td>
<td>Number identifying this patch’s associated Microsoft Security Bulletin.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the patch file.</td>
</tr>
<tr>
<td>Title</td>
<td>Title of the patch.</td>
</tr>
</tbody>
</table>

**See Also**

Environment Tree Views
Analyzing the Impact of Installing a Microsoft Operating System Patch

**Associated Patches View**

AdminStudio 2019 | Application Manager

_Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions._

On the Associated Patches View, you can view a list of imported patches that, if installed, would update the selected product. Application Catalog examines the patches in the catalog and attempts to identify those patches which will impact this package.
Due to differences in the way versions are compared, it is possible that other patches that impact this package may exist. For more definitive information, open the Patch Properties dialog box and compare the product and OS snapshot version information of the patch against the specific product and version information.

In the Associated Patches View, the following information is displayed:

**Table 15-20 • Associated Patches View Information**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the patch that is associated with this product.</td>
</tr>
<tr>
<td>Information</td>
<td>Microsoft Security Bulletin identification number and description of the patch.</td>
</tr>
</tbody>
</table>

If you double-click on a patch in the Associated Patches View, the Patch View (on the Environment tab) for that patch opens, listing general information on the selected patch.

### Analyze Dialog Boxes

**AdminStudio 2019 | Application Manager**

*Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The following dialog boxes are accessible from Application Catalog:

- About Application Catalog Dialog Box
- ACE Rule Properties Dialog Box
- Add Ignore Table Dialog Box
- Expression Builder Dialog Box
- Rules Viewer Dialog Box

### About Application Catalog Dialog Box

**AdminStudio 2019 | Application Manager**

*Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.*

The About Application Manager dialog box can be accessed by selecting About Application Manager on the Support tab of the Application Manager ribbon. This dialog box displays information about the product, including the full version number (essential if you need technical support).

To upgrade your edition of AdminStudio, click the Upgrade button. For more information, see Upgrading Your Product Edition.
ACE Rule Properties Dialog Box

The ACE Rule Properties dialog box allows you to edit an existing user-defined ACE rule. You can display the dialog by clicking Edit on the Rules Viewer dialog box.

The following tabs are part of the ACE Rule Properties dialog box:

- General Information Tab
- Additional Information Tab
- Custom Options Tab
- Where Clause Tab
- DLL Information Tab

Note • You can only edit user-defined ACE rules; you are not permitted to edit the ACE rules that were installed with Application Catalog.

General Information Tab

From the General Information tab, you can configure information about the new ACE rule.

This information is used primarily for display information (Name, Brief Description, Description, and Information URL).

Table 15-21 • General Information Tab Information

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the ACE, used to organize the rule in Application Catalog. This is displayed in several places, including the Output Window, the Rules Viewer dialog box, and the ACE Tests tab of the Options dialog box.</td>
</tr>
<tr>
<td>Associated Table</td>
<td>Select the table in the Application Catalog which will be queried in the user-defined ACE. This also determines which columns are available in the Expression Builder dialog box, and which tokens are available for the Error and Display strings on the Custom Options panel of the Rules Wizard.</td>
</tr>
<tr>
<td>Package Type</td>
<td>Select MSI or App-V to identify the type of package that this rule will be run on.</td>
</tr>
</tbody>
</table>

ACE Rule Properties Dialog Box

### Custom Options Tab

From the Custom Options tab, you can edit this ACE’s display strings for the Output window and Conflict Details.
The following options are included:

### Table 15-23 • Custom Options Tab Properties

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Error String** | This string appears in the Output window when a violation of this ACE rule is detected during conflict identification. For example, if you were creating a user-defined ACE to identify packages that create a desktop icon, you could enter the following in this field:  
  Failure in creating desktop icon  
  
  **Note** • Tokens allow you to insert values at run-time from the installation package into the string, such as specifying a file name. To use token replacement in the error string, use the arrow to the right of the Error String field. For more information, see Token Grammar. |
| **Display String** | This string appears on the **Application Conflicts** tab of the **Analyze Deployment Type View** after conflicts have been identified. For example, if you were creating a user-defined ACE to identify packages that create a desktop icon, you could enter the following in this field:  
  Duplicate desktop icon found  
  
  **Note** • Tokens allow you to insert values at run-time from the installation package into the string, such as specifying a file name. To use token replacement in the error string, use the arrow to the right of the Display String field. For more information, see Token Grammar. |
| **Severity** | Specify whether this ACE should be an Error or a Warning.                                                                                                                                                    |
| **Report 'No' results** | User-defined ACEs report conflicts based on the provided query. However, you may want to report the absence of the data if it could not be found. If you select this option, if the ACE does not return any results, it will be reported as an error (or warning), with the description and error strings as specified. If you expect a **No** result, do not use tokens in your display or error strings. |

To continue editing ACE Properties, click the General Information, Additional Information, or Where Clause tabs. To save your edits and close this dialog box, click OK.

**See Also**
ACE Rule Properties Dialog Box  
Token Grammar

### Where Clause Tab

**AdminStudio 2019 | Application Manager | ACE Rule Properties Dialog Box**

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.
From the Where Clause tab, you can edit the Where clause for the ACE. If you do not know how to build a Where clause, you can click the Build Expressions button to launch the **Expression Builder** dialog box. You can also click Test to validate the Where clause syntax.

If you selected Custom - Source and Target Packages when you created this ACE, you must have also selected a Join Column—a table column in the Application Catalog database that has a matching value for both the Source and Target packages. Rows in each of the packages that have a matching value in the Join Column are selected and those rows are checked against the Source and Target Packages. For example, if you wanted to evaluate records from two tables that have a installation directory of `C:\ProgramFiles`, then you would specify Directory as the Join column. To change the Join Column, select a different column name from the list.

To continue editing ACE Properties, click the General Information, Additional Information, or Custom Options tabs. To save your edits and close this dialog box, click OK.

**Tip** • To improve query performance, enclose table names in square brackets ([[]]).

**See Also**
ACE Rule Properties Dialog Box

### DLL Information Tab

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

From the **DLL Information** tab, you can edit specific information about the ACE/CARD DLL file and the ACE and CARD Function Names that DLL-based ACEs require to operate.

The following options are included:

**Table 15-24 • DLL Information Tab Information**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE/CARD DLL File</td>
<td>Select the name of the ACE DLL that you are testing.</td>
</tr>
<tr>
<td>ACE Function Name</td>
<td>Enter the name that you chose to “export” for this ACE function.</td>
</tr>
<tr>
<td>CARD Function Name</td>
<td>Enter the name that you chose to “export” for this CARD function.</td>
</tr>
<tr>
<td>Test</td>
<td>Click the Test button next to the ACE Function Name or CARD Function name to validate that the exported function does exist.</td>
</tr>
</tbody>
</table>

To continue editing ACE Properties, click the General Information or Additional Information tabs. To save your edits and close this dialog box, click OK.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Columns</td>
<td>This list is populated from the table columns in the table defined in the Rules Wizard General Information panel. Select the table column used in this Where clause.</td>
</tr>
<tr>
<td>Comparison Operator</td>
<td>Pick an operator to use for comparison in the Where clause. You can pick from the following:</td>
</tr>
<tr>
<td></td>
<td>• = (Equal To)</td>
</tr>
<tr>
<td></td>
<td>• &lt;&gt; (Not Equal To)</td>
</tr>
<tr>
<td></td>
<td>• &gt; (Greater Than)</td>
</tr>
<tr>
<td></td>
<td>• &lt; (Less Than)</td>
</tr>
<tr>
<td></td>
<td>• &gt;= (Greater Than or Equal To)</td>
</tr>
<tr>
<td></td>
<td>• &lt;= (Less Than or Equal To)</td>
</tr>
</tbody>
</table>
Tip • When you are constructing simple expressions, it is helpful to use the Expression Builder dialog box, but you are not limited to the formatting options that the Expression Builder provides to you. If you know how to write Where clauses in SQL, you can use significantly more powerful expressions by entering them directly in the Where Clause text box on the Where Clause panel of the Rules Wizard or on the Where Clause tab of the ACE Rule Properties Dialog Box.

### Table 15-25 • Expression Builder Dialog Box Properties (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>This constant can be a numerical value or string value. The property label will change based on the expected constant type. This value is compared against the data in the specified table.</td>
</tr>
</tbody>
</table>

**Note** • When using the Expression Builder dialog box to create a Source and Target Packages custom ACE to compare the value of a column in the source table to the value of a column in the target table, you can select the first table column name from the Table Columns list. However, you have to manually enter the second table column name in the Constant text box. When doing so, enter the table column name using the same syntax that is used in the Table Columns list: [Source].[ColumnName] or [Target].[ColumnName].

See Creating a Custom/Source and Target Packages ACE.

Expression Operator • If there is more than one expression in the Where clause, you can specify an operator to join the current expression to the previous expression.

Tip • When you are constructing simple expressions, it is helpful to use the Expression Builder dialog box, but you are not limited to the formatting options that the Expression Builder provides to you. If you know how to write Where clauses in SQL, you can use significantly more powerful expressions by entering them directly in the Where Clause text box on the Where Clause panel of the Rules Wizard or on the Where Clause tab of the ACE Rule Properties Dialog Box.

### Rules Viewer Dialog Box

AdminStudio 2019 | Application Manager

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

The Rules Viewer dialog box, accessible by clicking View Rules on the ACT Tests tab of the Application Catalog Options dialog box, allows you to view the current categorization of ACEs used for conflict identification. More importantly, it allows you to access the Rules Wizard to include user-defined ACEs in Application Catalog.

The primary window in the Rules Viewer dialog box displays a tree view containing each available ACE, grouped by category. If you click New, the Rules Wizard launches, allowing you to configure information for a new ACE.

When a user-defined ACE is selected on the Rules Viewer dialog box, the Edit button is enabled. When you click Edit, the ACE Rule Properties Dialog Box appears, where you can reconfigure the ACE. You can also delete user-defined ACEs by selecting them and clicking Delete.
Select Tests to Execute Dialog Box

AdminStudio 2019 | Application Manager

Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.

On the Select Tests to Execute dialog box, which is opened by clicking the Select Tests to Execute button in the ribbon on the Analyze tab, you can select the tests that you want to execute when the Execute Tests button is clicked.

Figure 15-10: Select Tests to Execute Dialog Box

For more information on these tests, see the following sections:

- Operating System Compatibility Tests
- Browser Compatibility Tests
- Application Virtualization Compatibility Tests
- Best Practices Tests
- Risk Assessment Tests
- Application Conflicts Tests
- Remote Application Publishing Compatibility Tests

Selecting Tests to Execute
Analyze Wizards

AdminStudio 2019 | Application Manager

The following wizards related to conflict analysis and resolution are included in Application Catalog:

- AdminStudio Test Configuration Wizard
- Conflict Wizard
- Rules Wizard

AdminStudio Test Configuration Wizard

Instead of selecting individual Operating System Compatibility and Browser Compatibility tests to run on the Select Tests to Execute dialog box, you have the option of using the AdminStudio Test Configuration Wizard to identify the tests to run by selecting one of three compliance levels, which are based on industry standard compliance rule sets:

- **Complete Analysis**—Test applications for all potential Operating System Compatibility and Browser Compatibility issues.
- **Industry Standard Analysis**—Test applications for all potential Browser Compatibility issues, but only test for the Operating System Compatibility issues that would cause an application to fail.
- **Industry Standard Analysis With Auto-Fixes**—Only test applications for potential Operating System Compatibility issues for which an automatic fix is available.

Using the Test Configuration Wizard, you can also further refine the tests that are run by specifying an OS Snapshot to test against. For example, if you select a Windows 7 32-bit OS Snapshot, only Windows 7 32-bit Operating System Compatibility tests will be selected, and only Internet Explorer 11 Browser Compatibility tests will be selected.

You open the AdminStudio Test Configuration Wizard by clicking Test Configuration Wizard on the Select Tests to Execute dialog box.

The AdminStudio Test Configuration Wizard consists of the following panels:

- Compliance Level Panel
- OS Snapshot(s) Panel
- Summary Panel

See Also

Setting the Compliance Level for Operating System Compatibility and Browser Compatibility Tests
Compliance Level Panel

On the Compliance Level panel of the AdminStudio Test Configuration Wizard, which is opened by clicking Test Configuration Wizard on the Select Tests to Execute dialog box, you can identify the Analyze tests to run by selecting one of three compliance levels, which are based on industry standard compliance rule sets:

Figure 15-11: Choose a Compliance Level Panel

The Choose a Compliance Level panel has the following options:

Table 15-26 • Choose a Compliance Level Panel

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete Analysis</td>
<td>Select this option to test applications for all potential Operating System Compatibility and Browser Compatibility issues.</td>
</tr>
<tr>
<td>Industry Standard Analysis</td>
<td>Select this option to test applications for all potential Browser Compatibility issues, but only test for the Operating System Compatibility issues that would cause an application to fail.</td>
</tr>
<tr>
<td>Industry Standard Analysis With Auto-Fixes</td>
<td>Select this option to only test applications for potential Operating System Compatibility issues for which an automatic fix is available.</td>
</tr>
<tr>
<td>Default Level</td>
<td>Click to reset the slider to Industry Standard Analysis, the default compliance level.</td>
</tr>
</tbody>
</table>
**Important** • *The Compliance Level* selection you make on this panel does not affect the selection of tests in the Application Conflicts, Application Virtualization Compatibility, Best Practices, Risk Assessment, or Remote Application Publishing Compatibility test categories.

**See Also**
- Setting the Compliance Level for Operating System Compatibility and Browser Compatibility Tests
- AdminStudio Test Configuration Wizard

**OS Snapshot(s) Panel**

**Edition** • *Application Manager* is included with *AdminStudio Professional and Enterprise Editions*.

The *OS Snapshot(s)* panel of the AdminStudio Test Configuration Wizard, which is opened by clicking *Test Configuration Wizard* on the *Select Tests to Execute* dialog box, lists all of the OS Snapshots you have imported into the Application Catalog and prompts you to select one or more to filter the test selection.

![OS Snapshot(s) Panel](image)

**Figure 15-12: OS Snapshot(s) Panel**

**Note** • For more information, see *Taking OS Snapshots* and *Importing OS Snapshots*.

If desired, select an OS Snapshot to test against. When you select an OS Snapshot to use to filter the test selection, the following items are considered:

- Operating system version
- Operating system patches applied
Internet Explorer version installed

.NET framework version installed

In addition to the level selected on the **Compliance Level** panel, the selection of Operating System Compatibility and Browser Compatibility tests will be further filtered if you select an OS Snapshot on the **OS Snapshot(s)** panel. The only Operating System Compatibility and Browser Compatibility test categories that will have any selected tests will be the categories corresponding to the selected operating systems. For example, if you choose a Windows 8.1 64-bit OS Snapshot, Operating System Compatibility tests will be selected only in the **Windows 8.1 64-bit** test category, and Browser Compatibility Tests will be selected only in the **Internet Explorer 11** test category:

![Operating System Compatibility Tests Filtered by Windows 8.1 64-bit](image)

**Figure 15-13**: Operating System Compatibility Tests Filtered by Windows 8.1 64-bit

**See Also**

Conflict Wizard

Although a Windows Installer package or merge module may be built to guidelines put forth by Microsoft, it is possible that the interaction between packages, or between a package and the base operating system, may cause unwanted results in your production environment. You can use the Conflict Wizard to identify these conflicts before you deploy packages, and resolve the problems before they affect your end users.

The Conflict Wizard allows you to identify conflicts between a Windows Installer package and packages already imported into the Application Catalog. You can check for a variety of conflict types, including file, component, and registry conflicts. In many cases, Application Catalog can resolve the issues automatically. You can also create your own custom rules to ensure packages conform to your internal standards and practices. Application Catalog has rules to detect conflicts involving: Components, Files, Registry Entries, Shortcuts, INI Files, ODBC Resources, NT Services, File Extensions, and Product Properties.

The Conflict Wizard consists of the following panels:

- Target Information Panel
- Target OS Snapshot Information Panel
- Summary Panel

When run, Application Catalog displays the output report in the Conflicts tab of the Output Window.

Target Information Panel

In the Target Information panel, select the individual packages or groups of packages in Application Catalog that you want to compare the source package(s) against.

Each package selected will be compared against the packages you specified in the Source Package panel (for internal comparisons) or MSI Source Information panel (for comparisons with an external Windows Installer package).

Note • The Target Information panel excludes all packages that you selected on the Source Package panel. Empty groups are also excluded.

You can also select all packages in the Application Catalog or clear all selected packages using the Select All and Clear All buttons.
Target OS Snapshot Information Panel

When you launch the Conflict Wizard from the Environment tab with an OS Snapshot selected in the tree, the Target Snapshot Information panel opens, prompting you to select the OS Snapshots against which you want to compare the source package in conflict analysis.

Select the snapshots and click Next to continue.

Summary Panel

The Summary panel provides a detailed summary of the options that were selected in the previous panels of the Wizard. Click Finish to run the Conflict Wizard using the options specified.

Mobile Test Wizard

AdminStudio’s mobile risk assessment tests enable you to find out which features a specific mobile app uses, such as telephone, location services, camera, microphone, etc. You can enhance this testing by using the Mobile Test Wizard to create custom tests that combine risk assessment checks with AND or OR operators. For example, you could create a custom test to see if a mobile application uses a gyroscope OR accelerometer. Or you could create a test that determines whether a mobile application uses location services AND allows location tracking.

The Mobile Test Wizard is opened by clicking New on the Mobile Tests tab of the Application Catalog Options dialog box.

The following panels are part of the Mobile Test Wizard:

- Select the Tests Panel
- Provide the Test Details Panel
- Summary Panel

Provide the Test Details Panel

AdminStudio 2019 | Application Manager

Edition • This feature is included with AdminStudio Professional Edition with Mobile.

On the Provide the Test Details panel of the Mobile Test Wizard, you are prompted to give the test a name, description, and a link to more information.
After the custom mobile test is added, the text you entered in the Name field will be displayed on the Mobile Tests tab of the Options dialog box.

The custom mobile test name is also listed on the Select Tests to Execute dialog box.
The information you entered in the **Brief Description**, **Description**, and **Help URL** fields of the **Provide the Test Details** panel will be displayed in the panel on the right that opens when the test is selected in the **Select Tests to Execute** dialog box.
When this issue is detected during the testing of a mobile app, the custom mobile test name is listed on the Best Practices tab:

Rules Wizard

Rules Wizard allows you to create user-defined ACE rules for later use in conflict identification. It is accessible by clicking New on the Rules Viewer dialog box.

The following panels are part of the Rules Wizard:

- Welcome Panel
- General Information Panel
- Additional Information
- Custom Options Panel
- Where Clause Panel
- DLL-Based ACEs Panel
- Summary Panel

Welcome Panel

The Rules Wizard allows you to create user-defined ACE rules for later use in conflict identification. The first panel displayed is the Welcome panel.

Click Next to proceed to the General Information panel.

General Information Panel

From the General Information panel, you can configure information about the new ACE rule. This information is used primarily for display information (Name, Brief Description, Description, and Information URL).
Also on the **General Information** panel, you specify whether you are creating a rule for a Windows Installer package (**MSI**) or a Microsoft App-V package (**AppV**).

### Table 15-29 • General Information Panel Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>The name of the ACE, used to organize the rule in Application Catalog. This is displayed in several places, including the Output Window, the Rules Viewer dialog box, and the <strong>ACE Tests</strong> tab of the <strong>Options</strong> dialog box.</td>
</tr>
<tr>
<td><strong>Associated Table</strong></td>
<td>Select the table in the Application Catalog which will be queried in the user-defined ACE. This also determines which columns are available in the Expression Builder dialog box, and which tokens are available for the Error and Display strings on the Custom Options panel of the Rules Wizard.</td>
</tr>
<tr>
<td><strong>Package Type</strong></td>
<td>Select <strong>MSI</strong> or <strong>App-V</strong> to identify the type of package that this rule will be run on.</td>
</tr>
<tr>
<td><strong>Brief Description</strong></td>
<td>Enter a brief description which will be displayed in the Rules Viewer, the <strong>ACE Tests</strong> tab of the <strong>Options</strong> dialog box, and in the Output Window. This description should be clear enough so users can understand when to use this ACE.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter a description of the ACE, which is displayed at the bottom of the Rules Viewer dialog box when the ACE is selected and in the Output Window during conflict identification when the ACE executes.</td>
</tr>
<tr>
<td><strong>Information URL</strong></td>
<td>Provide a URL to get further information for the ACE.</td>
</tr>
</tbody>
</table>

Click Next to proceed to the Additional Information panel; click Back to return to the Welcome panel.

### Additional Information

*AdminStudio 2019 | Application Manager | Rules Wizard*

**Edition** • Application Manager is included with AdminStudio Professional and Enterprise Editions.

From the Additional Information panel, you can provide information for categorizing the ACE in relation to other ACEs in Application Catalog.

### Table 15-30 • Additional Information Panel Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Category</strong></td>
<td>Either select an existing category for this new rule, or enter the name for a new category. These categories are displayed in the Conflict View and the <strong>ACE Tests</strong> tab of the <strong>Options</strong> dialog box. Ideally, any user-defined ACEs should be put in their own category.</td>
</tr>
</tbody>
</table>
Table 15-30 • Additional Information Panel Option (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Specify the type of ACE you are creating:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Custom - Source Only Packages ACEs</strong> allow you to quickly test any column or any value of a table to support your business logic. For example, you could use a user-defined ACE to identify packages that create a desktop icon. To define a Source Only Packages ACE, you must define an SQL &quot;Where&quot; clause. Application Catalog supports external package conflict checking for <strong>Custom - Source Only Packages ACEs</strong>. The Source package can be selected from the Application Catalog Database or from an external MSI package. See <a href="#">Creating a Custom/Source Only Packages ACE</a> for more information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Custom - Source and Target Packages ACEs</strong> allow you to compare columns or values of Source package tables (new packages that you want to install onto a user’s system) to columns or values of Target package tables (packages already installed on a user’s system). For example, you could use a Source and Target Packages ACE to determine if the installation of a Source package onto a Target system would overwrite or conflict with an existing entry in the .ini file in the System directory of the Target system. To define a Source and Target Packages ACE, you must define a SQL &quot;Where&quot; clause, and specify a Join Column—a table column in the Application Catalog database that has a matching value for both the Source and Target packages. Rows in each of the packages that have a matching value in the Join Column are selected and those rows are checked against the Source and Target Packages. Application Catalog does not support external package conflict checking for <strong>Custom - Source and Target Packages ACEs</strong>. Both the Source and Target Packages must be selected from the Application Catalog Database. See <a href="#">Creating a Custom/Source and Target Packages ACE</a> for more information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>DLL - User Provided DLL Based ACEs</strong> allow you to run more complex tests—testing many tables in any combination. For example, you could use a DLL-Based ACE to confirm that a source product language is the same as all target product languages. To define a DLL-Based ACE, you use SQL and various programming languages to construct a Windows DLL. With DLL-Based ACEs, you can use a Conflict Application Resolution Definitions (CARDs) to fix the conflict. See <a href="#">Creating a User Provided DLL-Based ACE</a>.</td>
</tr>
</tbody>
</table>

Click Next to proceed to the Custom Options panel or the DLL-Based ACEs panel; click Back to return to the General Information panel.

**Custom Options Panel**

*AdminStudio 2019 | Application Manager | Rules Wizard*

*Edition • Application Manager is included with AdminStudio Professional and Enterprise Editions.*
From the Custom Options panel, you can create display strings for the Output Window and Conflict Details.

Table 15-31 • Custom Options Panel Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error String</td>
<td>This string appears in the Output Window when a violation of this ACE rule is detected during conflict identification. For example, if you were creating a user-defined ACE to identify packages that create a desktop icon, you could enter <em>Failure in creating desktop icon</em> in this field.</td>
</tr>
</tbody>
</table>
|                 | **Note** Tokens allow you to insert values at run-time from the internal Application Catalog Database or an external MSI package into the string, such as specifying a file name. To use token replacement in the error string, click on the arrow to the right of the Error String field and pick a value from the list, or just type the values directly in the text box, in the following format:  
  - Source Only Packages ACEs: [ColumnName]  
  - Source and Target Packages ACEs: [Source.ColumnName] and [Target.ColumnName]  
  For more information, see *Token Grammar*. |
| Display String  | This string appears in the Application Conflicts tab of the Analyze Deployment Type View after conflicts have been identified. For example, if you were creating a user-defined ACE to identify packages that create a desktop icon, you could enter *Duplicate desktop icon found* in this field. |
|                 | **Note** Tokens allow you to insert values at run-time from the internal Application Catalog Database or an external MSI package into the string, such as specifying a file name. To use token replacement in the error string, click on the arrow to the right of the Display String field and pick a value from the list, or just type the values directly in the text box, in the following format:  
  - Source Only Packages ACEs: [ColumnName]  
  - Source and Target Packages ACEs: [Source.ColumnName] and [Target.ColumnName]  
  For more information, see *Token Grammar*. |
| Severity        | Specify whether this ACE should be an Error or a Warning.                                                                                                                                                     |
| Report 'No' results | User defined ACEs report conflicts based on the provided query. However, you may want to report the absence of the data if it could not be found. If you select this option, if the ACE does not return any results, it will be reported as an error (or warning), with the description and error strings as specified. If you expect a No result, do not use tokens in your display or error strings. |

Click Next to proceed to the Where Clause panel; click Back to return to the Additional Information panel.
Token Grammar

What are Tokens?
Tokens represent data in the database that is inserted at runtime. In Application Catalog, tokens are used to insert values at runtime from the Application Catalog Database or an external MSI package into an Error or Display String.

How to Insert Tokens
Tokens are specified on the Custom Options panel of the Rules Wizard. To use token replacement in a string, click the arrow to the right of the Error String and Display String text boxes and select a column name from the list. The column name is then inserted into the string in the following format:

- **Source Only Packages ACEs** — `[ColumnName]`
- **Source and Target Packages ACEs** — `[Source.ColumnName]` and `[Target.ColumnName]`, with the prefix identifying whether the column is in the Source or Target package. If no prefix is used, Application Catalog assumes the “Source.” prefix.

**Note** • The Token list on the Custom Options panel is provided for your convenience; if you prefer, you can type the variables directly in the text boxes. For more information see, Token Grammar.

**Caution** • While you are creating a user-defined ACE in the Rules Wizard, if you initially select a Rule Type of Custom - Source and Target Packages, and then insert tokens in the Error String and Display String fields, the “Source.” prefix will be used. But, before you finish creating this ACE, if you go back and change your Rule Type selection to Custom - Source Only Packages, the tokens that you initially entered into the Display and Error string text boxes will not automatically be updated to remove the “Source.” prefix. For Application Catalog to correctly interpret this ACE, you need to manually go back to the Error and Display String fields and delete the “Source.” prefix.

Using the ProductName Pseudo-tokens
You can use the pseudo-tokens of `[ProductName]`, `[Source.ProductName]` and `[Target.ProductName]` to insert the name of the Source or Target package in an Error or Display String, even though ProductName is not a table column name.

**See Also**
Creating a User Provided DLL-Based ACE

Where Clause Panel
From the Where Clause panel, you must define a valid Where clause for the ACE. If you do not know how to build a Where clause, you can click the Build Expressions button to launch the Expression Builder dialog box. You can also click Test to validate the Where clause syntax.

If you selected Custom - Source and Target Packages on the Additional Information panel, you must also select a Join Column—a table column in the Application Catalog database that has a matching value for both the Source and Target packages. Rows in each of the packages that have a matching value in the Join Column are selected and those rows are checked against the Source and Target Packages. For example, if you wanted to evaluate Source and Target packages that write files to the same directory, you might specify Directory as the Join column.

**Tip** • To improve query performance, enclose table names in square brackets ([[]]).

### DLL-Based ACEs Panel

DLL-based ACEs require specific information about the ACE/CARD DLL file and the ACE and CARD Function Names to operate. Enter the following information:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE/CARD DLL File</td>
<td>Select the name of the ACE DLL that you are testing.</td>
</tr>
<tr>
<td>ACE Function Name</td>
<td>Enter the name that you chose to “export” for this ACE function.</td>
</tr>
<tr>
<td>CARD Function Name</td>
<td>Enter the name that you chose to “export” for this CARD function.</td>
</tr>
<tr>
<td>Test</td>
<td>Click the Test button next to the ACE Function Name or CARD Function Name to validate that the exported function does exist.</td>
</tr>
</tbody>
</table>

Click Next proceed to the Summary panel; click Back to return to the Additional Information panel.

**See Also**

Creating a User Provided DLL-Based ACE

### Summary Panel

Once you have configured information for your ACE rule, the Summary panel displays information for final review.
Click Finish to accept this configuration and make the ACE available for conflict identification. Click Back to return to either the Where Clause panel or the DLL-Based ACEs panel.
The tests that are used to perform application conflict testing, operating system and browser compatibility, best practices testing, and risk assessment testing on packages in the Application Catalog using Analyze are described in this section. Tests are listed by group.

**Table 16-1 • Analyze Tests**

<table>
<thead>
<tr>
<th>Test Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operating System Compatibility Tests</strong></td>
<td>Test for application readiness on the following operating systems:</td>
</tr>
<tr>

Table 16-1  Analyze Tests (cont.)
Operating System Compatibility Tests

AdminStudio 2019 | Application Manager

Use the Operating System Compatibility tests to check for application readiness on Microsoft Windows (Server, Desktop, and Phone), Apple iOS, Apple OS X, and Google Android operating systems.

The following subcategories of Operating System Compatibility tests are available:

- Windows Server and Desktop Tests
- Windows Phone Tests
- Apple iOS Tests
- Apple OS X Tests
- Google Android Tests
Windows Server and Desktop Tests

AdminStudio 2019 | Application Manager

The Windows server and desktop operating system categories contain the following operating system compatibility tests:

- 32-Bit Driver
- 32-Bit Shell Extensions
- 64-Bit Files
- AdminUser or Privileged Launch Condition
- Application Requires Specific Minimum OS Version
- Application Requires VCLibs 12.0
- Application Requires VCLibs 14.0
- Application Requires WinJS 2.0 or Higher
- Applications with Known Windows OS Compatibility Issues
- Compatibility Issues with Known Issues at Startup
- Conditions Using AdminUser Property
- Conflicting Permission Tables
- Deferred Execution Custom Action Context
- Deprecated API Calls
- Deprecated Cluster Automation Server Functionality
- Deprecated Distributed File System Tool
- Deprecated Nested Windows Installer Packages
- Deprecated NETDDE Functionality
- Deprecated Proxy Configuration Tools
- Deprecated Server Manager Command-Line Tool
- Deprecated Windows Library Feature
- Drivers with Known Windows Compatibility Issues
- Excluded .NET Framework Payload Files
- ForceReboot Action
- Hard-Coded Paths
- Hard-Coded Paths in Script-Based Custom Actions
- IIS VBScripting Configuration
- Immediate Execution System-Context Custom Actions
- Installation to Secure Location
- Installers with Known Windows OS Compatibility Issues
- Interactive Services in Session 0
- Invalid Component Identifiers
- Junction Points
- Manifest Files Using Operating System Identifier
- Maximum Version of the OS Where This App Was Tested by the Developer
- Microsoft Management Console (MMC) Snap-ins Data Execution Prevention
- Mixed Per-User and Per-Machine Data
- Nested SendTo Menus
- Obsolete API Calls
- Obsolete File Associations
- Operating System Version Conditions
- Operating System Version Launch Conditions
- Quick Launch Bar
- Reboot Pending Launch Condition
- Reorganized Start Screen
- Restart Manager FilesInUse Dialog
- rundll32 Calls (User Account Control)
- Self-Update Functionality (User Account Control)
- Standard User Changes (User Account Control)
- Unmanifested Control Panel (.cpl) Files (User Account Control)
- Unmanifested Control Panel Applications (User Account Control)
- Unsigned Drivers
- Unsigned Executables
- Unsigned Windows Installer Database
- Unsupported .NET Framework 1.0/1.1 Applications
- Unsupported 16-Bit Files
- Unsupported 32-Bit Windows Help Files
- Unsupported DHTML Editing Control
- Unsupported GINA Functionality
- Windows Desktop Gadgets
- Windows Internet Explorer Protected Mode
- Windows Resource Protection Files

Severity

Error

Message

ERROR_MSG_1: This Windows Installer database contains 32-bit driver (FILE_PATH) (Table: File, Key: FILE_NAME).

Background

Hardware devices require 64-bit drivers on a 64-bit versions of Windows. Legacy 32-bit drivers may not work on 64-bit Windows systems.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix

The manufacturer of the driver should deliver a 64-bit version.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

No resolution is available.
32-Bit Shell Extensions

AdminStudio 2019 | Application Manager

**Note** • *This test is not applicable to App-V packages.*

The Windows Installer database is scanned for the presence of 32-bit shell extensions, which cannot be loaded on 64-bit operating systems.

**Test Group/Test Category**

- 0151—Operating System Compatibility/Windows Server 2008 R2
- 0251—Operating System Compatibility/Windows 7 64-Bit
- 0451—Operating System Compatibility/Windows 8.1 64-Bit
- 0551—Operating System Compatibility/Windows Server 2012
- 0651—Operating System Compatibility/Windows Server 2016
- 2151—Operating System Compatibility/Windows 10-1607 (and 2016 LTSC) (64-Bit)
- 2351—Operating System Compatibility/Windows 10-1703 (64-Bit)
- 2551—Operating System Compatibility/Windows 10-1709 (64-Bit)
- 2751—Operating System Compatibility/Windows 10-1803 (64-Bit)
- 2951—Operating System Compatibility/Windows 10-1809 (and 2019 LTSC) (64-Bit)

**Severity**

Error

**Message**

This Windows Installer database contains a 32-bit shell extension registered with file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

**Background**

Since the introduction of 64-bit operating systems, some program features that are available on Windows 32-bit operating systems are not available on computers that are running an x64-based version of Windows. A common problem is that third-party Windows Explorer shell extensions are not added to the Windows Explorer menu, such as the Windows Explorer shell extensions for WinZip and for WinRAR. These symptoms occur because Windows Explorer cannot load the 32-bit .DLL files that are required by the Windows Explorer shell extensions feature.

**Resolution**

The following resolutions are available. Note that this issue is not resolved automatically by default.
Manual Fix

An application compatible with the desired operating system should be delivered by its manufacturer. Alternatively, the 32-bit version of Windows Explorer can be used, which is located in the %windir%\Syswow64 folder on the computer that is running the x64-based version of Windows.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

No resolution is available.

Microsoft KB Article 895561

64-Bit Files

For this Operating System Compatibility test, the Windows Installer database is scanned for the presence of components that contain 64-bit files without conditions that enable them only for 64-bit Windows systems. The file extensions that are scanned are .exe, .dll, .sys, .drv, .ocx, .cpl, and .src.

Test Group/Test Category

- 0018—Operating System Compatibility/Windows 7 32-Bit
- 0318—Operating System Compatibility/Windows 8.1 32-Bit
- 2018—Operating System Compatibility/Windows 10-1607 (and 2016 LTSC) (32-Bit)
- 2218—Operating System Compatibility/Windows 10-1703 (32-Bit)
- 2418—Operating System Compatibility/Windows 10-1709 (32-Bit)
- 2618—Operating System Compatibility/Windows 10-1803 (32-Bit)
- 2818—Operating System Compatibility/Windows 10-1809 (and 2019 LTSC) (32-Bit)

Severity

Error

Message

This Windows Installer database contains 64-bit file [FILE_NAME] which might be installed in 32-bit systems (Table: File, key: [FILE_KEY]).

Background

Some software is intended to run only on 64-bit operating systems. If the launch conditions are missing or incorrect, 64-bit files might be installed on 32-bit Windows 7 systems. If a user attempts to launch such a file, they encounter an error message stating that the file is not a valid Win32 application.
Chapter 16  Analyze Tests
Operating System Compatibility Tests

Resolution
The following resolutions are available.

Manual Fix
A 32-bit application compatible with the desired operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered by replacing 64-bit code with the appropriate 32-bit code.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
The 64-bit files that are configured to be installed on 32-bit systems are moved to separate 64-bit components with conditions that enable them only for 64-bit systems; this is done in a Windows Installer transform.

This fix is enabled by default.

⚠️ Caution • On 32-bit systems, those files will not be installed.

- 2949—Operating System Compatibility/Windows 10-1809 (and 2019 LTSC) (64-Bit)

**Severity**
Warning

**Messages**
- This Windows Installer database contains LaunchCondition [LAUNCHCONDITION_NAME] using AdminUser property (Table: LaunchCondition, Key: [LAUNCHCONDITION_CONDITION]).
- This Windows Installer database contains LaunchCondition [LAUNCHCONDITION_NAME] using Privileged property (Table: LaunchCondition, Key: [LAUNCHCONDITION_CONDITION]).

**Background**
The Windows Installer properties AdminUser and Privileged may be used to prevent users who do not have administrator or elevated privileges from running the installation. These properties should not be used in the LaunchCondition table because Windows Installer may initially spoof their value during evaluation of the LaunchCondition table and set both to 1 even if the user is not an administrator and has not received elevated privileges yet. This behavior is present because privileges are elevated much later, and the result of authentication is not known when initial launch conditions are evaluated.

**Resolution**
The following resolutions are available. Note that this issue is not resolved automatically by default.

**Manual Fix**
A LaunchCondition table entry that uses the AdminUser or Privileged properties should be migrated to a type 19 custom action that uses the following condition:

\[ \text{NOT Privileged} \]

**Basic Auto Fix**
No resolution is available.

**Advanced Auto Fix**
No resolution is available.
Application Requires Specific Minimum OS Version

**Severity**

Error or Warning: This test will generate an Error if Microsoft has determined that the detected issue would prevent the installer from installing on this operating system, or it will generate a Warning if Microsoft has provided a workaround for the detected issue that will enable the installer to install on this operating system.

**Message**

[FILE_NAME]: Update has known compatibility issues with Windows [VERSION]. For more information, contact [VENDOR_NAME].

**Resolution**

Because Microsoft has detected a compatibility issue with this application, upgrade to a more recent version of this application, if possible.

**Compatibility Issues with Known Issues at Startup**

For this operating system compatibility test, the Windows Installer database is scanned for the presence of content that may trigger Application Help (Apphelp) messages during installation or at application startup. These types of messages warn end users that an application may have compatibility problems.

Severity

Error

Message

This Windows Installer database contains a program known to have compatibility issues. It may trigger Application Help (Apphelp) message during installation.

Background

When an application is launched, the Program Compatibility Assistant warns end users if the application is known to have compatibility issues. The list of these applications is stored in the System application compatibility database. These messages that the Program Compatibility Assistant displays are called Application Help (Apphelp) messages.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix

An application compatible with the desired Windows operating system should be delivered by its manufacturer.
Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Severity
Warning

Message
This Windows Installer database contains condition [CONDITION_NAME] using AdminUser property (Table: InstallUISequence, Key: [InstallUISequence_ACTION])

Background
The Windows Installer properties AdminUser and Privileged may be used to prevent users who do not have administrator or elevated privileges from running certain parts of the installation. The installation sets the Privileged property to 1 if the user has elevated privileges; it sets the AdminUser property to 1 only if the user was an administrator. The differences between these properties may have been used in some legacy packages. On Windows Vista/Windows Server 2008 and later systems, these two Windows Installer properties are always the same and the Privileged property is recommended.

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
The Windows Installer property AdminUser should be avoided; the Privileged property should be used instead. Packages that require distinct Privileged and AdminUser properties can restore the difference by setting the MSIUSEREALADMINDETECTION property.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Warning

Message
This Windows Installer database contains both LockPermissions and MsiLockPermissionsEx tables (Table: LockPermissions, MsiLockPermissionsEx).

Background
Since Windows Installer 5 (introduced with Windows 7), the MsiLockPermissionsEx table should replace the use of the LockPermissions table for managing access permissions. The extended functionality provided by the MsiLockPermissionsEx table enables a package to secure Windows Services, files, folders, and registry keys. Beginning with Windows Installer 5, the installation fails with error message 1941 if the Windows Installer package contains both a LockPermissions table and a MsiLockPermissionsEx table. Existing Windows Installer packages that contain only the LockPermissions table can still be installed using Windows Installer 5.

Note • Windows Installer 4.5 and earlier ignore the MsiLockPermissionsEx table.

Resolution
The following resolutions are available.
Manual Fix
If the LockPermissions and MsiLockPermissionsEx tables are not empty, all entries from LockPermissions table should be migrated to the MsiLockPermissionsEx table, and the LockPermissions table should be removed. Otherwise, at least one of those empty tables (either LockPermissions or MsiLockPermissionsEx) should be removed.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
The conflict between the LockPermissions and the MsiLockPermissionsEx table is resolved in a Windows Installer transform. If either one of the tables is empty, it is removed. If both tables are populated, entries from the LockPermissions table are converted to the MsiLockPermissionsEx table, and afterwards the empty LockPermissions table is removed. This fix is enabled by default.

Severity

Warning

Message

This Windows Installer database contains a deferred execution custom action [CUSTOM_ACTION_NAME] that is not running in system context (with no impersonation) (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).

Background

The purpose of a deferred execution custom action is to delay a system change until the installation script runs. This differs from a regular custom action or a standard action, where the installation executes the action immediately. Deferred execution custom actions that make system changes should be running in system context (with no impersonation).

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix

All deferred execution custom actions that make system changes should be adjusted to run in system context (with no impersonation).

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

Deferred execution custom actions are marked to run in system context (with no impersonation) in a Windows Installer transform.

Severity

Warning

Message

This Windows Installer database contains a reference to a deprecated API call [CALL_NAME] in file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

Background

A number of APIs that were previously used in Microsoft Windows are no longer supported on Windows 7 systems. Any application that calls these deprecated APIs might behave in unexpected ways.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix

A Windows 7-compatible application should be delivered by its manufacturer. Self-developed applications should be re-engineered to avoid calling deprecated APIs. Deprecated APIs are documented in Microsoft SDK updates.
Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Deprecated Cluster Automation Server Functionality

For this operating system compatibility test, the Windows Installer database is scanned for the presence of calls to the APIs `BackupClusterDatabase` or `RestoreClusterDatabase`. The extensions of the files that are scanned are `.exe`, `.dll`, `.sys`, `.src`, `.drv`, `.cpl`, and `.ocx`.

Test Group/Test Category
- 0133 — Operating System Compatibility/Windows Server 2008 R2
- 0533 — Operating System Compatibility/Windows Server 2012
- 0633 — Operating System Compatibility/Windows Server 2016

Severity
Error

Message
This Windows Installer database contains a reference to a deprecated Cluster Automation Server API call `[CALL_NAME]` in file `[FILE_NAME]` (Table: File, Key: `[FILE_KEY]`).

Background
The Cluster Automation Server provides a set of automation objects that expose a complete cluster management interface to scripting languages, allowing independent software vendors (ISVs) to develop web-based remote administration tools. The Cluster Automation Server simplified and enhanced the process of creating a cluster management application. The APIs `BackupClusterDatabase` and `RestoreClusterDatabase` are deprecated on Windows Server 2008 R2 systems.

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
A Windows Server 2008 R2-compatible application should be delivered by its manufacturer. Self-developed applications should be re-engineered to use the new Cluster VSS Writer to perform backups and restores of the cluster configuration.

Basic Auto Fix
No resolution is available.
Advanced Auto Fix
No resolution is available.

Deprecated Distributed File System Tool

For this operating system compatibility test, the package is scanned for the presence of references to dfscmd.exe inside shortcuts, custom actions, and script files. Scanned file extensions are: cmd and vbs.

Test Group/Test Category
- 0857—Operating System Compatibility/Windows Server 2012
- 0957—Operating System Compatibility/Windows Server 2016

Severity
Error

Messages
One of the following error messages is displayed:

This Windows Installer database contains a reference to Dfscmd.exe in script [FILE_NAME] (Table: File, Key: [FILE_KEY]).

This Windows Installer database contains a reference to Dfscmd.exe in shortcut [SHORTCUT_NAME] (Table: Shortcut, Key: [SHORTCUT_NAME]).

This Windows Installer database contains a reference to Dfscmd.exe in custom action [CUSTOM_ACTION_NAME] (Table: CustomAction, Key: [CUSTOM_ACTION_NAME]).

Background
Distributed File System (DFS) is a set of client and server services that allow an organization using Microsoft Windows Server to organize many distributed file shares into a distributed file system. Starting with Windows Server 2012 R2, Microsoft has deprecated the command line tool that configures DFS folders and folder targets in a DFS namespace.

Resolution
The following resolutions are available.

Manual Fix
A Windows Server 2012 R2 compatible application should be delivered by its manufacturer. Self-developed applications should be re-engineered to use Windows PowerShell cmdlets for Distributed File Namespaces or the dfsutil.exe command set.

Basic Auto Fix
No resolution is available.
Advanced Auto Fix

No resolution is available.

Severity
Warning

Messages
- This Windows Installer database contains custom action type 7 (concurrent installation of an embedded Windows Installer Package) (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).
- This Windows Installer database contains custom action type 23 (concurrent installation of a source Windows Installer package) (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).
- This Windows Installer database contains custom action type 39 (concurrent installation of an advertised Windows Installer package) (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).

Background
Concurrent installations, also called *nested installations*, install another Windows Installer package during a currently running installation. Microsoft has deprecated this Windows Installer feature since it might cause several issues that range from patch and upgrade problems to unwanted reboots.

Resolution
The following resolutions are available.

Manual Fix
Custom actions type 7, 23, and 39 should be disabled. A setup application and an external UI handler should be created to install all needed Windows Installer packages sequentially.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
Custom actions type 7, 23, and 39 are disabled in a Windows Installer transform. Nested Windows Installer databases are extracted and put in a subfolder called Dependencies_%Source% adjacent to the original Windows Installer database. Additionally, an installation script called Install_Dependencies_<name_of_original_msi>.cmd is created; it sequentially launches the dependent Windows Installer packages that were originally called from within the parent.

This fix is enabled by default.

Severity

Error

Message

This Windows Installer database contains a Network DDE call [REGISTRY_VALUE] in registry entry
[REGISTRY_KEY]\[REGISTRY_NAME] (Table: Registry, Key: [REGISTRY_ENTRY]).

Background

Microsoft deprecated Network DDE (NetDDE) in Windows Vista. NetDDE is a technology that allows applications that use
the DDE transport to exchange data over the network. Applications that use this technology might fail.

Note • Regular DDE is still supported.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.
Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to use a different networking technology, such as DCOM or Windows Communication Foundation.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Severity
Warning

Message
This Windows Installer database contains a .NET assembly [FILE_NAME] compiled with Microsoft .NET Framework version [VERSION] (Table: File, Key: [FILE_KEY]).

Background
On Windows 8/Windows Server 2012 and later systems, Microsoft .NET Framework 4.5 is enabled by default. The manifests for .NET Framework 3.5 (including .NET 2.0 and 3.0) are also included, but without the supporting payload files. With a clean installation of Windows 8/Windows Server 2012 or later, applications that require .NET Framework 2.0 or 3.5 might trigger a request for the necessary files.
Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to use Microsoft .NET Framework 4.0 or later. Where this is not feasible, Microsoft provides a downloadable .NET Framework 3.5 (including .NET 2.0 and 3.0) feature available through Windows Update or on the original installation media.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Severity
Warning

Message
This Windows Installer database contains ForceReboot action that may run on Windows [VERSION] (Table: InstallExecuteSequence, Key: ForceReboot).

Background
The ForceReboot action prompts the user for a restart of the system during the installation. If the installation is displaying a user interface, the installation shows a dialog at each ForceReboot action; the dialog prompts the user to restart the system. The user must respond to this prompt before continuing with the installation. If the installation has no user interface, the system automatically restarts at the ForceReboot action. When Windows Installer determines that a restart is necessary, it automatically prompts the user to restart at the end of the installation, regardless of whether there are any ForceReboot or ScheduleReboot actions in the sequence.

Resolution
The following resolutions are available.

Manual Fix
A condition that suppresses the ForceReboot action on the specified Windows operating system systems should be added. This fix is enabled by default.

Basic Auto Fix
A condition is added to the ForceReboot action to disable the action on Windows systems; this is done through a Windows Installer transform.

Advanced Auto Fix
No resolution is available.

Messages

- This Windows Installer database contains a hard-coded path "[REGISTRY_VALUE]" in registry entry [REGISTRY_KEY] (Table: Registry, Key: [REGISTRY_ENTRY]).
- This Windows Installer database contains a hard-coded path "[INI_FILE_KEY]" in a key of an INI file (Table: IniFile, Key: [INIFILE_KEY]).
• This Windows Installer database contains a hard-coded path "[INI_FILE_VALUE]" in a value of an INI file (Table: IniFile, Key: [INIFILE_KEY]).

• This Windows Installer database contains a hard-coded path "[CUSTOM_ACTION_TARGET]" in the CustomAction table (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).

• This Windows Installer database contains a hard-coded path "[SHORTCUT_ARGUMENTS]" in shortcut [SHORTCUT_NAME] (Table: Shortcut, Key: [SHORTCUT_KEY]).

• This Windows Installer database contains a hard-coded path "[SERVICECONTROL_ARGUMENTS]" in the ServiceControl table (Table: ServiceControl, Key: [SERVICECONTROL_KEY]).

• This Windows Installer database contains a hard-coded path "[SERVICEINSTALL_ARGUMENTS]" in the ServiceInstall table (Table: ServiceInstall, Key: [SERVICEINSTALL_KEY]).

Background

During migration to a new environment, some paths might have changed or became obsolete, eventually causing hard-coded values in Windows Installer databases (for example, in the Registry or IniFile tables) to no longer be valid. This could result in installation failures or functionality issues.

Note • ICE48 checks for directories that are hard-coded to local paths.

Resolution

The following resolutions are available.

Manual Fix

For each hard-coded path, a property that contains that value should be created. That property should replace the hard-coded path.

Basic Auto Fix

Hard-coded paths are replaced with properties that contain the original paths in a Windows Installer transform. The newly created properties are named ASFIX_PATH_# (where # is an enumerator to uniquely name the properties).

This fix is enabled by default.

Advanced Auto Fix

No resolution is available.

IIS VBScripting Configuration
AdminStudio 2019 | Application Manager

Note • This test is not applicable to App-V packages.

For this operating system compatibility test, the Windows Installer database is scanned for the presence of custom actions and scripts that are used to configure an Internet Information Services (IIS) server. Additionally, the database is scanned for the presence of deprecated IIS libraries. The extensions that are scanned are .vbs and .cmd.
Test Group/Test Category

- 0134—Operating System Compatibility/Windows Server 2008 R2
- 0534—Operating System Compatibility/Windows Server 2012
- 0634—Operating System Compatibility/Windows Server 2016

Severity

Warning

Messages

- This Windows Installer database contains custom action [CUSTOM_ACTION_KEY] that configures Internet Information Services (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).
- This Windows Installer database contains custom action [CUSTOM_ACTION_KEY] that configures Internet Information Services via script [FILE_KEY] (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).
- This Windows Installer database contains script [FILE_NAME] that configures Internet Information Services via [FILE_KEY] (Table: File, Key: [FILE_KEY]).
- This Windows Installer database contains script [FILE_NAME] that uses deprecated Internet Information Services interface (Table: File, Key: [FILE_KEY]).

Background

IIS 6 had several interfaces for automated management via scripts. Windows Server 2008 and later systems (with IIS 7 and later) do not support this functionality. Many applications that use VBScript code to manipulate IIS configuration might not function as expected.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix

A Windows Server 2008 R2-compatible application should be delivered by its manufacturer. Self-developed applications should be re-engineered to use IIS 7 interfaces. If this is not feasible, the IIS 6 Management Compatibility role should be installed using Server Manager.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

No resolution is available.

Severity

Warning

Message

This Windows Installer database contains non-impersonated immediate custom action [CUSTOM_ACTION_NAME] (Table: CustomAction, Key: [CUSTOM_ACTION_KEY]).
Background
The purpose of a deferred execution custom action is to delay a system change until the installation script runs. This differs from a regular custom action or a standard action, where the installation executes the action immediately. Immediate custom actions are not elevated; therefore, actions that make system changes should be deferred in execution until in-script is generated.

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
All custom actions that make system changes should be deferred in execution to run in the script.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
Non-impersonated immediate custom actions are marked to run as deferred actions in a Windows Installer transform.

Operating System Compatibility Tests

Severity
Warning

Message
This Windows Installer database contains file FILE_NAME being installed to restricted location PATH (Table: File, Key: FILE_KEY).

Background
When a Windows Store application is added to a Windows 8/Windows Server 2012 or later system, it is installed in the Program Files\WindowsApps directory. If desktop applications are installed to this location, they may cause collisions with existing configurations. In addition, some antivirus/anti-malware detectors identify this location as a potential cause for concern.

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should not install to the restricted location.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Severity

Error or Warning: This test will generate an Error if Microsoft has determined that the detected issue would prevent the installer from installing on this operating system, or it will generate a Warning if Microsoft has provided a workaround for the detected issue that will enable the installer to install on this operating system.

Message

[PACKAGE_NAME] AND [PRODUCT_NAME] AND [PRODUCT_VERSION] has a known compatibility issue with this version of Windows and might not run as expected. For more information, contact [VENDOR_NAME].

Resolution

Because Microsoft has detected a compatibility issue with this installer, use a more recent version of this installer, if possible.

Interactive Services in Session 0

Note • This test is not applicable to App-V packages.

For this operating system compatibility test, the Windows Installer database is scanned for the presence of services that are being installed or configured and that require interaction with the user’s environment.

Severity

Error

Message

This Windows Installer database contains interactive service [SERVICE_NAME] ([FILE_NAME]) (Table: ServiceInstall, Key: [SERVICEINSTALL_KEY]).

Background

Windows system processes and services run in Session 0. On systems earlier than Windows Vista, the first user who logged on to the console also used Session 0. Running services and user applications together in Session 0 poses a security risk because services run at elevated privileges and therefore are targets for malicious agents trying to elevate their own privilege levels. To eliminate the security risk, Session 0 is non-interactive on Windows Vista and later systems; that is, the first user logs on to Session 1. However, services still run in Session 0. This means that services that need to display user interface dialog boxes or communicate with user applications must properly secure a communication channel. If this is not done, the services fail to work properly on Windows 7 and later systems.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.
Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to establish correct communications with required services that are running in Session 0.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

**Severity**
Warning

**Messages**

• This Windows Installer database contains component [COMPONENT_NAME] with null Globally Unique Identifier (GUID) (Table: Component, Key: [COMPONENT_NAME]).

• This Windows Installer database contains component [COMPONENT_NAME] with invalid Globally Unique Identifier (GUID) [COMPONENT_ID] (Table: Component, Key: [COMPONENT_NAME]).

• This Windows Installer database contains duplicated component Globally Unique Identifier (GUID) [COMPONENT_ID] (Table: Component, Keys: [COMPONENT_NAME]).

**Background**

Windows Installer tracks every component by its component GUID, which is specified in the Component table. It is essential for the operation of the Windows Installer reference-counting mechanism that the component GUID is set and its value is correct. The ComponentID property takes a string that is formatted as a GUID, using the format {XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}, where X is a hexadecimal digit (0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F). The braces are required.

**Resolution**

The following resolutions are available.

**Manual Fix**

Each component should receive a non-null, valid GUID in the ComponentId field.

**Basic Auto Fix**

Valid GUIDs are generated for each component that has a null or invalid GUID; this is done through a Windows Installer transform.

This fix is enabled by default.

**Advanced Auto Fix**

No resolution is available.

**See Also**

ComponentId Property

**Junction Points**

AdminStudio 2019 | Application Manager

This Windows Installer database contains a hard-coded path "[ENVIRONMENT_VALUE]" in environment variable [ENVIRONMENT_NAME] (Table: Environment, Key: [ENVIRONMENT_KEY]).

This Windows Installer database contains a hard-coded path [SHORTCUT_ARGUMENTS] in arguments of shortcut [SHORTCUT_NAME] (Table: Shortcut, Key: [SHORTCUT_KEY]).

Background

Beginning with Windows Vista, the default locations for user and system data have changed. For example, user data that was previously stored in the %SystemDrive%\Documents and Settings directory is now stored in the %SystemDrive%\Users directory. For backward compatibility, the old locations have junction points that point to the new locations. For example, C:\Documents and Settings is now a junction point that refers to C:\Users.

Resolution

The following resolutions are available.

Manual Fix

Changed or obsolete junction points should be replaced with the appropriate Windows Installer property.

Basic Auto Fix

Changed or obsolete junction points are replaced with the appropriate Windows Installer properties in a Windows Installer transform.

This fix is enabled by default.

Advanced Auto Fix

No resolution is available.

Severity
Warning

Message
This Windows Installer database contains a manifest file [FILE_NAME] with a compatibility section that has no <supportedOS> tag that refers to Windows 8 (Table: File, Key: [FILE_KEY]).

Background
On Windows 7 and later systems, applications can specify supported operating system identifiers through their manifest files. A manifest file is a simple .xml file that contains settings that inform the operating system how to handle the program when it is launched. On Windows 7 and later systems, compatibility information for operating system support is read from the <supportedOS> tags in the compatibility section of the manifest file. The operating system chooses the highest version identifier in the manifest up to the running Windows version and gives the application support at that level. Applications without a compatibility section in their manifest file have Windows Vista behavior by default on Windows 7 and later systems. This might break visual appearance or functionality (for example, the client area of applications might be rendered without a theme in high contrast mode).

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered by updating the application manifests with the latest compatibility information for operating system support.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.
Maximum Version of the OS Where This App Was Tested by the Developer

For this operating system compatibility test, the application is scanned to determine the maximum version of the Windows OS where this app was tested by the developer and known to be in a working state.

Severity

Error

Message

This Windows Installer database contains Microsoft Management Console snap-in [FILE_NAME2] referencing a non DEP-aware library [FILE_NAME2] (Table: File, Keys: [FILE_KEY1], [FILE_KEY2]).

Background

On Windows XP SP2 and later systems, the DEP security feature prevents an application or a service from executing code from a non-executable memory region. Microsoft Management Console (MMC) is a common presentation service for management applications, hosting snap-ins provided by Microsoft and third-party software manufacturers. MMC.exe always runs with DEP enabled: the feature cannot be turned off, and no compatibility mode exists. Snap-ins that are not DEP-aware might fail to load within the MMC or might not work properly.

Resolution

The following resolutions are available.
Manual Fix

An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered so that all Microsoft Management Console snap-ins (.msc) are DEP-aware.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

Microsoft Management Console snap-ins (.msc) that are not DEP-aware are removed in a Windows Installer transform.
This fix is enabled by default.

⚠️  
**Caution** • *Caution: Removed snap-ins might cause (part of) the application to not function or to function incorrectly.*

(UNKNOWN_REGISTRY_ENTRIES) may be either per-user or per-machine, depending on installation context (Table: Component, Key: [COMPONENT_NAME]).

- This Windows Installer Database contains component [COMPONENT_NAME] with per-machine data ([PER_MACHINE_FILES], [PER_MACHINE_REGISTRY_ENTRIES]) and per-machine file keypath [COMPONENT_KEY_PATH]. Additionally, a part of the data (UNKNOWN_REGISTRY_ENTRIES) may be either per-user or per-machine, depending on installation context (Table: Component, Key: [COMPONENT_NAME]).

- This Windows Installer Database contains component [COMPONENT_NAME] with per-machine data ([PER_MACHINE_FILES], [PER_MACHINE_REGISTRY_ENTRIES]) and per-machine registry keypath [COMPONENT_KEY_PATH]. Additionally, a part of the data (UNKNOWN_REGISTRY_ENTRIES) may be either per-user or per-machine, depending on installation context (Table: Component, Key: [COMPONENT_NAME]).

- This Windows Installer Database contains component [COMPONENT_NAME] with per-machine data ([PER_MACHINE_FILES], [PER_MACHINE_REGISTRY_ENTRIES]) and per-machine directory keypath [COMPONENT_KEY_PATH]. Additionally, a part of the data (UNKNOWN_REGISTRY_ENTRIES) may be either per-user or per-machine, depending on installation context (Table: Component, Key: [COMPONENT_NAME]).

- This Windows Installer Database contains component [COMPONENT_NAME] with per-machine data ([PER_MACHINE_FILES], [PER_MACHINE_REGISTRY_ENTRIES]). Additionally, a part of the data (UNKNOWN_REGISTRY_ENTRIES) may be either per-user or per-machine, depending on installation context (Table: Component, Key: [COMPONENT_NAME]).

**Background**

Mixing per-user and per-machine data in the same component could result in only partial installation of the component for some users in a multiuser environment.

**Resolution**

The following resolutions are available.

**Manual Fix**

Per-user and per-machine data should be moved to separate components.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

Per-user content and per-machine content are moved to separate components in a Windows Installer transform.

This fix is enabled by default.

Severity

Warning

Message

This Windows Installer database contains a shortcut [SHORTCUT_NAME] created in a subfolder of the SendTo folder (Table: Shortcut, Key: [SHORTCUT_KEY]; Table: Directory, Key: [DIRECTORY_KEY]).

Background

The SendTo folder contains shortcuts for possible destinations to which files and folders can be sent. Since Windows Vista, shortcuts that are placed in subfolders of the SendTo folder are not shown. Only shortcuts that are placed directly in the SendTo folder are visible in the context menu.
Resolution
The following resolutions are available.

Manual Fix
Shortcuts in subfolders of the SendTo folder should be moved directly into the SendTo folder. Empty subfolders should be removed.

Basic Auto Fix
Shortcuts in subfolders of the SendTo folder are moved directly into the SendTo folder in a Windows Installer transform. This fix is enabled by default.

Advanced Auto Fix
No resolution is available.

Obsolete API Calls
For this operating system compatibility test, the Windows Installer database is scanned for references to obsolete API calls. The extensions of the files that are scanned are .exe, .dll, .sys, .src, .drv, .cpl, and .ocx.

**Severity**

Error

**Message**

This Windows Installer database contains a reference to an obsolete API call [CALL_NAME] in file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

**Background**

A number of API calls that were previously used in Microsoft Windows are no longer supported on Windows 7 and later systems. These functions may have been removed from corresponding DLLs, or those DLL are not available on Windows 7 and later systems. Obsolete functions cannot be called, and programs that attempt to use them may fail to launch or may not function as expected.

**Resolution**

The following resolutions are available. Note that this issue is not resolved automatically by default.

**Manual Fix**

An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to avoid calling obsolete API calls. Obsolete API calls are documented in Microsoft SDK updates.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

No resolution is available.

**Obsolete File Associations**

Chapter 16  Analyze Tests
Operating System Compatibility Tests

Messages

- This Windows Installer database contains component [COMPONENT_NAME] using condition "[COMPONENT_CONDITION]" that evaluates to false for Windows [VERSION] (Table: Component, Key: [COMPONENT_NAME]).
- This Windows Installer database contains custom action [InstallExecuteSequence_ACTION] using condition "[InstallExecuteSequence_CONDITION]" that evaluates to false for Windows [VERSION] (Table: CustomAction, Key: [InstallExecuteSequence_ACTION]).
- This Windows Installer database contains security entry [MsiLockPermissionsEx_ENTRY] in MsiLockPermissionsEx using condition [MsiLockPermissionsEx_CONDITION] that evaluates to false for Windows [VERSION] (Table: MsiLockPermissionsEx, key: [MsiLockPermissionsEx_ENTRY]).
- This Windows Installer database contains feature [CONDITION_FEATUREKEY] using conditional Install Level with condition "[CONDITION]" that evaluates to false for Windows [VERSION] (Table: Feature, Key: [CONDITION_FEATUREKEY]; Table: Condition, Key: [CONDITION_FEATUREKEY], [CONDITION_LEVEL]).

Background

Windows Installer provides the built-in properties VersionNT and WindowsBuild, which can be used in conditions to determine, for a given version of the operating system, which Windows Installer features/components should be installed, which custom actions should be executed, and/or what security should be applied.

Resolution

The following resolutions are available.

Manual Fix

The tables InstallExecuteSequence, MsiLockPermissionsEx, Condition, and Component should be scanned for conditions that evaluate to false for the specified Windows operating system. If the component, feature, custom action, or security is needed, the condition should be modified so that it evaluates to true for the specified Windows operating system.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

Conditions in the Windows Installer tables InstallExecuteSequence, MsiLockPermissionsEx, Condition, and Component that evaluate to false for the specified Windows operating system are replaced with a condition that evaluates to true in a Windows Installer transform.

This fix is enabled by default.

⚠️ Caution • This workaround enables the entire Windows Installer database, including anything that was not intended for the specified Windows operating system.

**Severity**

Warning

**Message**

This Windows Installer database contains Launch Condition "[LAUNCHCONDITION]" that prevents the software from being installed in Windows [VERSION] (Table: LaunchConditions, Key: [LAUNCHCONDITION_KEY]).
Background

Launch conditions are usually evaluated in the very beginning of the installation process for a Windows Installer package. If any of these conditions evaluates to false, the installation does not take place. Launch conditions often rely on the value of the VersionNT or VersionBuild properties, which depend on the operating system version.

Resolution

The following resolutions are available.

Manual Fix

Unless the application is known to cause problems on the specified Windows operating system, launch conditions that might prevent the installation from taking place on the specified Windows operating system should be removed.

Basic Auto Fix

No resolution is available.

Advanced Auto Fix

Launch conditions that prevent the installation from taking place on the specified Windows operating system are removed in a Windows Installer transform.

This fix is enabled by default.

⚠️ Caution • This workaround enables the installation of a Windows Installer package, even if it was not intended for the specified Windows operating system.

**Severity**

Warning

**Message**

This Windows Installer database contains shortcut [SHORTCUT_NAME] installed in the Quick Launch bar (Table: Shortcut, Key: [SHORTCUT_KEY]).

**Background**

The Quick Launch bar is a dockable toolbar that contains user-defined shortcuts to applications. Icons in this area respond to a single click. Since Windows 7, this functionality is included on the taskbar buttons (shortcuts can be pinned to the taskbar) and the Quick Launch bar is by default not available. It can be enabled, but it has compatibility issues with the Language bar. If both are enabled, the Quick Launch bar is removed after the machine is restarted.

**Resolution**

The following resolutions are available.

**Manual Fix**

Quick Launch shortcuts should be moved to another location or pinned to the taskbar. Alternatively, the Quick Launch bar can be enabled.

⚠️ **Caution** • *Enabling the Quick Launch bar is not recommended because of possible conflicts with the Language bar.*

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

Quick Launch shortcuts are removed in a Windows Installer transform. This fix is enabled by default.

- 0648—Operating System Compatibility/Windows Server 2016

Severity
Warning

Message
This Windows Installer database does not contain any LaunchCondition that prevent the installation when system reboot is pending (Table: LaunchCondition).
**Background**

The installation sets the value of the `MsiSystemRebootPending` property to 1 if there is an operation pending to rename a file. Package authors can base a condition in the LaunchCondition table on this property to prevent the installation of their package in cases where there is an operation pending to rename a file. This may prevent a restart of the operating system caused by the renaming of the file. Any installation that explicitly uses the `MsiSystemRebootPending` property in the LaunchCondition table may not continue when there are pending operations that require a system reboot.

**Resolution**

The following resolutions are available.

**Manual Fix**

The following condition should be added to the LaunchCondition table to prevent the installation of the package if a system reboot is pending and required.

```
NOT MsiSystemRebootPending
```

**Basic Auto Fix**

The following condition is added through a Windows Installer transform.

```
MsiSystemRebootPending <> 1
```

This fix is enabled by default.

**Advanced Auto Fix**

No resolution is available.

**See Also**

`MsiSystemRebootPending Property`

Messages
- This Windows Installer database contains a shortcut [SHORTCUT_NAME] to a non-executable file [FILE_NAME] which might not be pinned to the Start screen (Table: Shortcut, Key: [SHORTCUT_KEY]).
- This Windows Installer database contains a shortcut [SHORTCUT_NAME] in a subfolder of the "Start Menu\Programs" folder which might not be displayed correctly in the All Apps view (Table: Shortcut, Key: [SHORTCUT_KEY]).

Background
On Windows 8 and later systems, the Start Menu is no longer available, and its functionality has been replaced with a new Start screen. The appearance and functionality of the new solution might result in an ambiguous shortcut structure. Windows 8 and later automatically pins shortcuts to executable files to the new Start screen. However, it does not pin shortcuts for other file types (for example, text files, help files, and command files [.bat, .cmd]). Note that the shortcuts are still visible when the user browses to the All Apps applet; this is the equivalent of the “All Applications” on the old Start Menu.

Furthermore, on Windows 8 and later systems, the tree hierarchy from the old Start Menu is no longer available. Shortcuts in the All Apps applet are grouped by the root subfolders in the Start Menu folder. Shortcuts from subfolders are displayed in one group with no visual clue to which group it belongs. Hence, if two shortcuts with the same name exist in different subfolders, users might be unable to distinguish between them. This behavior might limit productivity.

Resolution
The following resolutions are available. Note that this issue is not resolved automatically by default.

Manual Fix
Shortcuts should be renamed to unequivocally express their behavior and affiliation. For example, instead of using generic names like Readme or Help documentation, a more specific name like Readme for <application name> or Help documentation for <application name> should be used. Shortcuts to non-executable files should be manually pinned by the logged-on user.
Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

Restart Manager FilesInUse Dialog

*Note* • This test is not applicable to App-V packages.

For this operating system compatibility test, the Windows Installer database is scanned for the absence of the Restart Manager FilesInUse dialog (MsiRMFilesInUse) and the MSIRESTARTMANAGERCONTROL property value that disables Restart Manager.

Severity

Warning
Messages

- This Windows Installer database does not contain definition of Restart Manager Files in Use (MsiRMFilesInUse) dialog to handle Restart Manager on Windows 7 (Table: Dialog).
- This Windows Installer database contains Restart Manager Files in Use (MsiRMFilesInUse) dialog suppressed by property MSIRESTARTMANAGERCONTROL (the current value is [PROPERTY_VALUE]) (Table: Property, Key: MSIRESTARTMANAGERCONTROL).

Background

The MsiRMFilesInUse dialog can be authored to display a list of processes that are currently running files that need to be overwritten or deleted by the installation. The dialog contains two options to allow end users to specify how to proceed:

- Users can choose to have the installation close the applications that are using those files and then attempt to restart the applications after the installation is complete.
- Users can avoid closing the applications. A reboot will be required at the end of the installation.

If the user selects the first option, a push button control on this dialog can be authored to publish the RMShutdownAndRestart control event, and the Restart Manager can close the applications and restart them at the end of the installation. This can eliminate or reduce the need to restart the computer. The MsiRMFilesInUse dialog is displayed during an installation only if installation is running with full user interface and the MsiRMFilesInUse dialog is present in Dialog table. Additionally, the public property MSIRESTARTMANAGERCONTROL can be used to disable Restart Manager.

Resolution

The following resolutions are available.

Manual Fix

The MsiRMFilesInUse dialog should be added to the Dialog table of the Windows Installer database.

Basic Auto Fix

The MsiRMFilesInUse dialog is enabled through a Windows Installer transform.

This fix is enabled by default.

Advanced Auto Fix

No resolution is available.

Severity

Error

Messages

• This Windows Installer database contains a custom action calling rundll32.exe (Table:CustomAction, Key: [CUSTOM_ACTION_KEY]).
• This Windows Installer database contains a system startup registry entry calling rundll32.exe (Table: Registry, Key: [REGISTRY_ENTRY]).
• This Windows Installer database contains a shortcut to rundll32.exe (Table:Shortcut, Key: [SHORTCUT_KEY]).
• This Windows Installer database contains a reference to rundll32.exe in Windows Installer property (Table:Property, Key: [PROPERTY]).

Background

The Windows tool rundll32.exe is used to run executable code in DLL files as if it were called by an application. On Windows Vista and later systems, User Account Control (UAC) can cause problems for solutions that use rundll32.exe. When an application that relies on rundll32.exe needs elevated privileges to perform some global tasks, it is rundll32.exe (rather than the application) that requests the UAC elevation prompt. As a result, the user sees a request from Windows host process (rundll32). Without a clear description and icon for the application that is requesting
elevation, users have no way to identify the application and determine whether it is safe to elevate it. Any DLL that runs under rundll32.exe and that needs elevation should be modified into an executable file that has its elevation level set in its manifest.

**Resolution**

The following resolutions are available. Note that this issue is not resolved automatically by default.

**Manual Fix**

A “Run DLL as an app” DLL call should be wrapped in a separate executable file. Additionally, a manifest file for this executable file should be included with the required elevated privileges setting.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

No resolution is available.

- 0619—Operating System Compatibility/Windows Server 2016

**Severity**

Warning

**Message**

This Windows Installer database contains self-update functionality in file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

**Background**

Some software has a built-in mechanism to automatically update itself. Self-updating should be avoided in a managed environment due to lack of control over managed software and privilege issues. Furthermore, the self-update functionality might leave old files behind or cause issues when the software is being removed. Since Windows Vista, installation and update programs are recognized and, if UAC is enabled, cause prompts for credentials. This is done to prevent installations without the user’s knowledge and approval.

**Resolution**

The following resolutions are available.

**Manual Fix**

Self-update functionality of the software should be disabled.

**Basic Auto Fix**

A manifest file is added for each unmanifested installation or upgrade in a Windows Installer transform. The content of the manifest depends on whether the executable file is UAC aware. If the executable file is UAC aware, the manifest file sets the privilege level to requireAdministrator. If the executable is not UAC aware, the manifest file sets the privilege level to asInvoker.

This fix is enabled by default.

**Advanced Auto Fix**

⚠️ **Caution•** This might have a high negative impact on application functionality.

Severity

Warning

Message

This Windows Installer database contains an unmanifested file [FILE_NAME] (Table: File, Key: [FILE_KEY]).
Background

On Windows Vista and later systems, all applications are run by default with standard user privileges, even when the logged-on user is a member of the Administrators group. If an application requires elevated privileges, an accompanying manifest file can indicate this. At run time, Windows confirms that the privilege elevation that is declared in the manifest aligns with the user’s intention by displaying a UAC prompt for consent or credentials. Unmanifested executable files do not trigger a UAC prompt, and any actions that require elevated privileges—including any changes to system or global settings—silently fail. Therefore, unmanifested applications that require elevated privileges might not function properly.

Resolution

The following resolutions are available.

Manual Fix

For each unmanifested executable file, create a manifest file that sets the required privilege level. For applications that do not require administrative privileges, the required privilege level should be set to asInvoker. (That is, the UAC prompt is not shown, and permissions are not elevated.) Otherwise, the required privilege level should be set to either requireAdministrator or highestAvailable. If an application seeks an unsuited privilege level (and the manifest cannot be corrected), you can create a shim database specify the desired privilege level.

Basic Auto Fix

A manifest file is added in a Windows Installer transform to each application that requires administrative privileges but does not already have an embedded or associated manifest file. The content of the manifest depends on whether a given executable file is UAC aware. If the executable file is UAC aware, the manifest file sets the privilege level to requireAdministrator. If the executable is not UAC aware, the manifest file sets the privilege level to asInvoker.

This fix is enabled by default.

Advanced Auto Fix

No resolution is available.

Severity
Warning

Message
This Windows Installer database contains unmanifested Control Panel file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

Background
On Windows Vista and later systems, all applications are run by default with standard user privileges (even when the logged-on user is a member of the Administrators group). As a result, unmanifested Control Panel (.cpl) files might fail. A manifest file is a simple .xml file that contains settings that inform the operating system how to handle the program when it is launched.

Resolution
The following resolutions are available.

Manual Fix
Control Panel (.cpl) files should be embedded in .exe files that include a manifest that specifies the privilege level that is required to execute the application. Where this is not feasible, an external manifest file can be created. In the latter case, the manifest file must be located in the same folder with the .cpl file and named the same as the full file name of the .cpl file, with a .manifest extension (for example, <application_name>.cpl.manifest).

Basic Auto Fix
For each unmanifested Control Panel (.cpl) file, a manifest file that specifies privilege level highestAvailable is added in a Windows Installer transform.

This fix is enabled by default.
Advanced Auto Fix

For each unmanifested Control Panel (.cpl) file, a manifest file that specifies privilege requireAdministrator is added in a Windows Installer transform.

- **0621**—Operating System Compatibility/Windows Server 2016

**Severity**

Warning

**Message**

This Windows Installer database contains a driver ([FILE_NAME]) which is not correctly signed (Table: File, Key: [FILE_KEY]).

**Background**

A signed device driver includes a digital signature (an electronic security mark that can indicate the manufacturer of the software, as well as validate the original contents of the driver package). If a driver has been signed by a manufacturer that has verified its identity with a certification authority, it is confirmed that the driver actually comes from that publisher and has not been altered. If a user tries to install an unsigned driver, Windows displays a warning and prompts the user.

**Resolution**

The following resolutions are available.

**Manual Fix**

A signed version of the driver should be delivered by its manufacturer. Alternatively, Windows Driver Kit (WDK) from Microsoft can be used to sign the driver with a trusted certificate.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

Unsigned drivers are removed in a Windows Installer transform.

This fix is enabled by default.

**Caution** • This might have a high negative impact on application functionality.

Severity
Warning

Message
This Windows Installer database contains unsigned executable [EXECUTABLE_NAME] (Table: File, Key: [FILE_NAME]).
**Background**

According to Microsoft best practices, all binaries should be digitally signed with a certificate issued by a Trusted Publisher. The Trusted Publisher’s certificate store contains information about the Authenticode (signing) certificates of Trusted Publishers that are installed on a computer. Unsigned executables will prompt the user for authorization.

**Resolution**

The following resolutions are available. Note that this issue is not resolved automatically by default.

**Manual Fix**

The application with executables signed by a Trusted Publisher should be delivered by its manufacturer.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

No resolution is available.

**Severity**

Error

**Message**

This Windows Installer database contains application [FILE_NAME] dependent on .NET Framework Version [VERSION] (Table: File, Key: [FILE_KEY]).

**Background**

Microsoft .NET Framework 1.0 and 1.1 are not supported on Windows 7 and later systems. Although it may be possible to install .NET Framework 1.0 or 1.1 components on Windows 7, Microsoft provides no level of support for these configurations.

**Resolution**

The following resolutions are available. Note that this issue is not resolved automatically by default.

**Manual Fix**

An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to use a more recent version of .NET Framework.

**Basic Auto Fix**

No resolution is available.

- 2917—Operating System Compatibility/Windows 10-1809 (and 2019 LTSC) (64-Bit)

Severity
Error

Message
This Windows Installer database contains 16-bit file [FILE_NAME] which might be installed in 64-bit systems (Table: File, key: [FILE_KEY]).
Background
Since the introduction of 64-bit Windows systems, 16-bit code is no longer supported. If the launch conditions are missing or incorrect, 16-bit files might be installed on 64-bit Windows Server 2008 R2 systems. If a user attempts to launch such a file, they encounter an error message stating that the file is not a valid Win32 application.

Resolution
The following resolutions are available.

Manual Fix
A Windows Server 2008 R2-compatible application should be delivered by its manufacturer. Self-developed applications should be re-engineered by replacing 16-bit code with the appropriate 32- or 64-bit code.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
The 16-bit files that are configured to be installed on 64-bit systems are moved to separate components with conditions that enable them only for 32-bit systems; this is done in a Windows Installer transform.

This fix is enabled by default.

⚠️
Caution • On 64-bit systems, those files will not be installed.

- **0601** — Operating System Compatibility/Windows Server 2016

**Severity**

Warning

**Message**

[PACKAGE_NAME] (Table: File, Key: [FILE_KEY]).

**Background**

Windows Vista and later do not support 32-bit Windows Help files (.hlp), now superseded by HTML Help (.chm). Users who try to open .hlp files see an error message instead of the expected Help. Note that support for viewing 16-bit .hlp files remains available in Windows 7.

**Resolution**

The following resolutions are available.

**Manual Fix**

Windows Help (.hlp) files should be converted to the Microsoft HTML Help (.chm) format. Where the conversion is not feasible, Microsoft supplies a downloadable version of the executable for 32-bit .hlp files, available from update KB917607.

**Basic Auto Fix**

The Windows Help browser (WinHlp32.exe) and necessary file associations are added in a Windows Installer transform via a Merge Module.

This fix is enabled by default.

**Advanced Auto Fix**

The Windows Help browser (WinHlp32.exe) for Windows 7 (update KB917607) is added in a Windows Installer transform via a Merge Module.

- 2708 — Operating System Compatibility/Windows 10-1803 (64-Bit)
- 2908 — Operating System Compatibility/Windows 10-1809 (and 2019 LTSC) (64-Bit)
- 0108 — Operating System Compatibility/Windows Server 2008 R2
- 0508 — Operating System Compatibility/Windows Server 2012
- 0608 — Operating System Compatibility/Windows Server 2016

**Severity**

Warning

**Message**

This Windows Installer database contains executable [FILE_NAME] requiring the DHTML Editing Control for Applications (Table: File, Key: [FILE_KEY]).

**Background**

The DHTML Editing Control, which Microsoft originally released in 1998, is an ActiveX control designed for WYSIWYG HTML editing in Web pages and Windows-based applications. Windows Vista and later systems do not support this control because of security reasons. Software that incorporates the DHTML Editing Control for Applications no longer functions as intended on Windows 7 systems. For example, Delphi applications may cause unhandled exceptions and Visual Basic
applications may display the following message when they are opened or when the form that contains the control is instantiated: "Component 'dhtmled.ocx' or one of its dependencies is not registered correctly: a file is missing or invalid."

**Resolution**

The following resolutions are available.

**Manual Fix**

Applications that require the DHTML Editing Control should use a different WYSIWYG HTML editor. Where this is not feasible, Microsoft provides a downloadable original control in a signed Windows Installer package called DHTMLEd.msi.

⚠️ **Caution** • *Since this workaround leaves applications unchanged, they remain exposed to the same security risks that Microsoft originally identified.*

**Basic Auto Fix**

The contents of the DHTMLEd.msi from Microsoft are added in a Windows Installer transform via a Merge Module.

This fix is enabled by default.

⚠️ **Caution** • *Since this workaround leaves applications unchanged, they remain exposed to the same security risks that Microsoft originally identified.*

**Advanced Auto Fix**

No resolution is available.

**See Also**

Replacing the DHTML Editing Control in Windows Vista and Beyond

**Unsupported GINA Functionality**

- **0530**—Operating System Compatibility/Windows Server 2012
- **0630**—Operating System Compatibility/Windows Server 2016

**Severity**
Error

**Message**
This Windows Installer database contains unsupported customized GINA functionality (Table: Registry, Key: [REGISTRY_KEY]).

**Background**
Microsoft changed the interactive logon process in Windows Vista. On earlier systems, where software required a logon to a third-party server or a logon using a third-party device, the supplier had to replace the built-in Windows library MSGina.dll with a custom DLL. The new authentication model on Windows Vista and later systems removes GINA functionality (including customization). Software that uses the original or customized GINA functionality does not work on Windows Vista or later systems.

**Resolution**
The following resolutions are available.

**Manual Fix**
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to support the Credential Providers model as described by Microsoft.

**Basic Auto Fix**
No basic fix is available.

**Advanced Auto Fix**
Registry value HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\GinaDLL is removed in a Windows Installer transform.
This fix is enabled by default.
Chapter 16  Analyze Test
Operating System Compatibility Tests

⚠️ **Caution** • If this workaround is applied to software using a customized logon through a modified GINA module, it is possible that the installation might fail, and highly likely that users might not be able to log on.

Chapter 16  Analyze Tests
Operating System Compatibility Tests

Severity
Warning

Message
This Windows Installer database attempts to turn off Windows Internet Explorer Protected Mode (Table: Registry, Key: [REGISTRY_ENTRY]).

Background
On Windows Vista and later systems, Internet Explorer runs by default in Protected Mode. By preventing unauthorized access to sensitive areas of a user's system, Protected Mode limits the amount of damage that a compromised Internet Explorer process or malware can cause. As a result, applications that use Internet Explorer cannot write directly to the disk while in the Internet or Intranet zones. In addition to displaying a warning message when web pages try to write to protected areas, Internet Explorer also informs the user when web pages try to run certain software programs.

Resolution
The following resolutions are available.

Manual Fix
An application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to correctly handle Internet Explorer Protected Mode. When this is not feasible, the needed web sites should be added to the list of trusted sites.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
Registry entries that are responsible for turning off the Internet Explorer Protected Mode are removed in a Windows Installer transform.

This fix is enabled by default.

Note • An additional manual action is needed: the web sites should be added to the list of trusted sites.

Severity
Warning

Message
This Windows Installer database contains Windows Resource Protection file [FILE_NAME] (Table: File, Key: [FILE_KEY]).

Background
On Windows Vista and later systems, WRP prevents the modification of essential system files, folders, and registry keys that are installed as part of the operating system. Protecting these resources prevents application and operating system failures. Accordingly, Windows Installer automatically and silently ignores attempts to write or modify a protected resource. If the application was installed with Windows Installer and logging was enabled, a warning might be logged for each file operation that was ignored because of WRP. WRP files can be installed or updated only using Microsoft-provided redistributable packages that are designed for Windows 7.

Resolution
The following resolutions are available.
Chapter 16  Analyze Tests
Operating System Compatibility Tests

Manual Fix
Affected files should be assessed whether they are required for the application to run successfully on Windows 7 systems. If
the file is required, an application compatible with the specified Windows operating system should be delivered by its
manufacturer. Self-developed applications should be re-engineered to respect WRP restrictions.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
WRP files are removed in a Windows Installer transform.
This fix is enabled by default.

⚠️ Caution • If the application relies on particular settings in the now protected area, this workaround might still result in run-
time errors.)

**Severity**

Warning

**Message**

This Windows Installer database contains Windows Resource Protection registry entry [REGISTRY_KEY] (Table: Registry, Key: [REGISTRY_ENTRY]).

**Background**

On Windows Vista and later systems, WRP prevents the modification of essential system files, folders, and registry keys that are installed as part of the operating system. Protecting these resources prevents application and operating system failures. Accordingly, Windows Installer automatically and silently ignores attempts to write or modify a protected resource. If the application was installed with Windows Installer and logging was enabled, a warning might be logged for each registry key write operation that was ignored because of WRP. Starting with Windows 7, several additional registry keys are protected via Windows WRP. To preserve the installation process, Windows Installer might report success in changing these keys, even though the operation failed. If the application relies on particular settings in the now protected area, this strategy might result in run-time errors. WRP registry entries can be written only using Microsoft-provided redistributable packages that are designed for Windows 7 or later.

**Resolution**

The following resolutions are available.

**Manual Fix**

Affected registry entries should be assessed whether they are required for the application to run successfully on the specified Windows systems. If the registry entry is required, an application compatible with the specified Windows operating system should be delivered by its manufacturer. Self-developed applications should be re-engineered to respect WRP restrictions.

**Basic Auto Fix**

No resolution is available.

**Advanced Auto Fix**

WRP registry keys are removed in a Windows Installer transform. This fix is enabled by default.

⚠️ **Caution** • If the application relies on particular settings in the now protected area, this workaround might still result in run-time errors.
Windows Phone Tests

The Windows Phone category consists of the following Operating System Compatibility tests:

Application Requires 64-bit Processor (MAC005 / MAC105)

For this operating system compatibility test, the macOS application is scanned to determine if it requires 64-bit architecture.

Test Group/Test Category
- MAC005 — Operating System Compatibility/Apple/Desktop/macOS 10.11 El Capitan
- MAC105 — Operating System Compatibility/Apple/Desktop/macOS 10.12 Sierra

Severity
Warning

See Also
Apple iOS Dev Center
Deprecated APIs (MAC004 / MAC104)

AdminStudio 2019 | Application Manager

For this operating system compatibility test, the macOS application’s .plist file is scanned for references to deprecated functions.

Apple publishes a list of deprecated and removed frameworks for each major OS update. The highest priority would be finding applications that rely on a “removed” framework. In OS X, when an API is deprecated, a warning is generated to inform the developer that the API will be removed in a future update, but the application will generally still work in the current OS X release. Applications that use deprecated frameworks should be identified so that you can look for an update from the application’s developer in the near future.

Test Group/Test Category

- MAC004—Operating System Compatibility/Apple/Desktop/macOS 10.11 El Capitan
- MAC104—Operating System Compatibility/Apple/Desktop/macOS 10.12 Sierra

Severity

Deprecated APIs generate a Warning.

Obsolete APIs generate an Error.

See Also

Apple iOS Dev Center

Deprecated Frameworks (MAC002 / MAC102)

AdminStudio 2019 | Application Manager

For this operating system compatibility test, the macOS application is scanned to determine if it contains references to a deprecated framework.

Similar to the Windows “shim” database, macOS has a list of applications that are known to have compatibility issues. OS X will either prevent them from installing, or prevent them from running if they were installed prior to the OS upgrade. When you upgrade your Mac to OS X, or when you migrate your content to a new Mac, software that is known to be incompatible with the new version of OS X is set aside and won’t run on your updated system.

Note • During the upgrade or migration process, OS X creates an Incompatible Software folder at the top level startup drive of your Mac. Software known to be incompatible with the new version of OS X is placed in this folder. You can look in this folder to see the applications that were set aside.

Test Group/Test Category

- MAC002—Operating System Compatibility/Apple/Desktop/macOS 10.11 El Capitan
- MAC102—Operating System Compatibility/Apple/Desktop/macOS 10.12 Sierra

Severity

Warning
Resolution

If you want to use one of these incompatible applications, you need to get an updated version that is compatible with your new OS. Applications in the Mac App Store list their compatibility and system requirements on their product pages. You can also check with the application developer to find out if they have a new, compatible version or plan to release one.

See Also
Apple iOS Dev Center

Deprecated Property List Keys (MAC001 / MAC101)

AdminStudio 2019 | Application Manager

For the MAC001 Operating System Compatibility test, the macOS application is scanned to determine if the package has references to deprecated property list keys, such as legacy Java applications.

Applications with the Java dictionary listed in their .plist file will trigger OS X to prompt the user to install Java 6, even if the application relies on newer versions of Java. This is a legacy function and triggers OS X to expect a legacy dependency (Java 5 or 6). Applications with the Java dictionary in the .plist file are highlighted as a compatibility error.

Test Group/Test Category

- **MAC001**—Operating System Compatibility/Apple/Desktop/macOS 10.11 El Capitan
- **MAC101**—Operating System Compatibility/Apple/Desktop/macOS 10.12 Sierra

• Deprecated Dynamic Properties (1112 / 1212 / 1312 / 1412)
• Deprecated HyperText Markup Language (HTML) Tags (1101 / 1201 / 1301 / 1401)
• Deprecated Property for Cross-Browser Plugins (1325 / 1425)
• Deprecated Synthetic Events (1428)
• Deprecated Vector Markup Language (VML) Elements (1218 / 1318 / 1418)
• Double Execution of onload and onreadystatechange Events (1108 / 1208 / 1308 / 1408)
• Flexible Box Changes in CSS Scripts (1324 / 1424)
• Non-Standard Protocol Handlers (1110 / 1210 / 1310)
• Removed JavaScript API Features (1322)
• Request For Comments (RFC) Compliancy (1113, 1213, 1313)
• Status Bar Scripting (1111 / 1211 / 1311 / 1411)
• Unsupported Cascading Style Sheet (CSS) Features (1114 / 1214 / 1314 / 1414)
• Unsupported DHTML Editing Control (1102 / 1202 / 1302 / 1402)
• Unsupported Document Compatibility Modes (1316 / 1416)
• Unsupported Fullscreen API (1426)
• Unsupported JavaScript Frameworks (1109 / 1209 / 1309)
• Unsupported Plug-ins for Internet Explorer in the Windows UI (1219 / 1319)
• Unsupported Plug-ins for Microsoft Edge (1419)
• Unsupported Pointer Events (1323 / 1423)
• Unsupported Touch Detection (1121)
• Unsupported Use of createElement() Method (1103 / 1203 / 1303 / 1403)
• Unsupported VBScript Code (1321 / 1421)
• Unsupported Web Cryptography Property (1427)
• Unsupported XML Data Islands (1220 / 1320 / 1420)
• User-Agent String Detection (1107 / 1207 / 1307 / 1407)
• XSLT (Extensible Stylesheet Language Transformations) Compatibility (1115 / 1215 / 1315 / 1415)

See Also
Operating System Compatibility Tests
Conditional Comments (1106 / 1206 / 1306 / 1406)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the use of conditional comments that evaluate the version of Internet Explorer or Microsoft Edge.

Caution • Some web applications use conditional comments for fixing well-known visual glitches in older versions of Internet Explorer. This test may generate false positives for such web applications.

Test Group/Test Category

- 1306 — Browser Compatibility/Internet Explorer 11
- 1406 — Browser Compatibility/Microsoft Edge

Severity

Warning

Message

This web application contains conditional comment "[COMMENT]" which does not recognize [BROWSER AND VERSION] (File: [FILE_NAME]).

Background

Internet Explorer / Microsoft Edge provide non-standard conditional comments. They can be used to provide content that is tailored for a specific browser type and version (for example, dedicated HTML, stylesheet, or JavaScript code). Since the major version number has been changed in Internet Explorer 11 and later, some web applications that use conditional comments may not recognize Internet Explorer 11 or later, and they may serve incompatible content.

Resolution

The web application should be re-engineered to avoid relying on conditional comments. World Wide Web Consortium (W3C) recommendations (for example, JavaScript-based feature detection) should be used instead.

See Also

About Conditional Comments

Deprecated arguments.caller Property (1104 / 1204 / 1304 / 1404)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the usage of the deprecated arguments.caller property.

Test Group/Test Category

- 1304 — Browser Compatibility/Internet Explorer 11
- 1404 — Browser Compatibility/Microsoft Edge
Chapter 16  Analyze Tests
Browser Compatibility Tests

Severity
Warning

Message
This web application contains deprecated arguments.caller property (File: [FILE_NAME]).

Background
When arguments objects are created in Internet Explorer 10 and earlier, a property named caller is created. This caller property stores the reference to the argument object of the function that called it. Internet Explorer 11 and later do not support the arguments.caller property. When a script tries to use this property, Internet Explorer 11 and later generate the script error “object is null or undefined.” Depending on where the call is located, portions of the web application may fail to work.

Resolution
The web application should be re-engineered to avoid using the arguments.caller property. Where this is not feasible, Internet Explorer 11 Compatibility View should be used. It can be triggered by using the meta attribute value X-UA-Compatible.

See Also
IE9 Standards Mode Does Not Support the arguments.caller Property

Deprecated DirectX-Based Filters and Transitions (1117 / 1217 / 1317 / 1417)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the usage of deprecated DirectX-based filters and transitions that are not supported.

Test Group/Test Category
• 1317—Browser Compatibility/Internet Explorer 11
• 1417—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains deprecated DirectX-based filter [ELEMENT] (File: [FILE_NAME]).

Background
Internet Explorer 4.0 introduced support for DirectX-based visual filters and transitions called DX filters, which enabled web developers to apply multimedia-style effects to their web pages. Internet Explorer 11 and later support a standards-based alternative to common DX filters.
**Note** • The legacy support is available in Internet Explorer 11 in document modes 5, 7, and 8; however, their performance is inferior to their standards-based replacements.

**Resolution**

The web application should be re-engineered by moving to standards-based technologies. Where this is not feasible, the Internet Explorer Compatibility View should be used. It can be triggered by using the meta attribute value `X-UA-Compatible`.

**See Also**

Visual Filters and Transitions Reference

**Deprecated Document Object Model (DOM) Events Features (1105 / 1205 / 1305 / 1405)**

For this browser compatibility test, the web application contents are scanned for the usage of the following deprecated Document Object Model (DOM) events features: `attachEvent`, `detachEvent`, `createEventObject`, or `fireEvent`.

**Test Group/Test Category**

- **1305**—Browser Compatibility/Internet Explorer 11
- **1405**—Browser Compatibility/Microsoft Edge

**Severity**

Warning

**Message**

This web application contains deprecated Document Object Model (DOM) events feature [METHOD] (File: [FILE_NAME]).

**Background**

The following DOM events features were deprecated starting in Internet Explorer 11: `attachEvent`, `detachEvent`, `createEventObject`, or `fireEvent`.

**Resolution**

The web application should be re-engineered to avoid using deprecated DOM events features. The W3C standards replacements should be used.

**See Also**

Some DOM Events Are Deprecated
Deprecation Dynamic Properties (1112 / 1212 / 1312 / 1412)

For this browser compatibility test, the web application contents are scanned for the usage of deprecated dynamic properties in cascading style sheets (CSS) or JavaScript code.

Test Group/Test Category

- 1312 — Browser Compatibility/Internet Explorer 11
- 1412 — Browser Compatibility/Microsoft Edge

Severity

Warning

Messages

- This web application contains a deprecated dynamic Cascading Style Sheets (CSS) property [PROPERTY_EXPRESSION] (File: [FILE_NAME]).
- This web application contains a deprecated JavaScript dynamic property method [PROPERTY_METHOD] (File: [FILE_NAME]).

Background

Internet Explorer 5 introduced support for dynamic CSS properties—also called CSS expressions—which could be used to declare property values as formulas instead of just as constants. Dynamic properties have sometimes been used to work around unsupported properties in older versions of Internet Explorer. However, dynamic properties negatively affect standard compliance, performance, reliability, and security; thus, in Internet Explorer 11 and later, dynamic properties are deprecated.

Note • Dynamic properties are still supported for web applications that are displayed in Internet Explorer 5 (Quirks) mode or Internet Explorer 11 Standards mode.

Resolution

JavaScript event listeners should be used as a replacement for the dynamic properties functionality.

See Also

About Dynamic Properties

Deprecation HyperText Markup Language (HTML) Tags (1101 / 1201 / 1301 / 1401)

For this browser compatibility test, the web application contents are scanned for use of the deprecated HyperText Markup Language (HTML) tags and JavaScript methods.
**Test Group/Test Category**

- 1301—Browser Compatibility/Internet Explorer 11
- 1401—Browser Compatibility/Microsoft Edge

**Severity**

Warning

**Messages**

- This web application contains deprecated HTML tag [DEPRECATED_TAG] (File: [FILE_NAME]).
- This web application contains obsolete JavaScript blink() method (File: [FILE_NAME]).

**Background**

In Windows, Microsoft has deprecated a number of HyperText Markup Language (HTML) tags and connected JavaScript methods.

**Resolution**

The web application should be re-engineered to avoid using deprecated HTML tags. For example, the same functionality can be achieved via cascading style sheets (CSS) or JavaScript.

**See Also**

- HTML Tag Methods (JavaScript)

---

**Deprecated Property for Cross-Browser Plugins (1325 / 1425)**

For this browser compatibility test, the web application contents are scanned for usage of the window.activexobject property.

**Test Group/Test Category**

- 1325—Browser Compatibility/Internet Explorer 11
- 1425—Browser Compatibility/Microsoft Edge

**Severity**

Warning

**Background**

Since Windows Internet Explorer 11, the navigator object supports plugins and Internet media type (a.k.a. MIME type) properties. In addition, the windowactivexobject property is hidden from the Document Object Model (DOM) and it is not possible to determine if a plugin is present using this property.
Resolution

The web application should be re-engineered to use replacements for the `window.ActiveXObject` property.

Cross-Browser Plugin Detection

Deprecated Synthetic Events (1428)

For this browser compatibility test, the web application contents are scanned for usage of synthetic events.

Test Group/Test Category

- 1428—Browser Compatibility/Microsoft Edge

Severity

Warning

Messages

This web application contains deprecated synthetic events (File: [FILE_NAME]).

Background

The web application should be re-engineered to use new events. When creating and firing synthetic events, the `createEvent()/BindEvent()` pattern has been deprecated and the DOM L4 event constructor pattern using new `Event()` is recommended.

Resolution

The web application should be re-engineered to use replacements for the `window.ActiveXObject` property.

See Also

Creating and Firing Synthetic Events

Deprecated Vector Markup Language (VML) Elements (1218 / 1318 / 1418)

For this browser compatibility test, the web application contents are scanned for the usage of deprecated Vector Markup Language (VML) technology.

Test Group/Test Category

- 1318—Browser Compatibility/Internet Explorer 11
- 1418—Browser Compatibility/Microsoft Edge
**Severity**
Warning

**Message**
This web application contains deprecated Vector Markup Language element [ELEMENT] (File: [FILE_NAME]).

**Background**
Since Windows Internet Explorer 11, Microsoft has deprecated support for Vector Markup Language (VML). This language was used to produce vector graphics displayed in web applications.

*Note* • Support for VML is available in Internet Explorer 11 in document modes 5, 7, 8, and 9; however, the performance is inferior to the standards-based replacements.

**Resolution**
The web application should be re-engineered by moving to standards-based technologies—for example, scalable vector graphics (SVG) format. Where this is not feasible, the Internet Explorer Compatibility View should be used. It can be triggered by using the meta attribute value `X-UA-Compatible`.

**See Also**
VML is No Longer Supported

**Double Execution of onload and onreadystatechange Events (1108 / 1208 / 1308 / 1408)**

**AdminStudio 2019 | Application Manager**
For this browser compatibility test, the web application contents are scanned for the presence of both `onload` and `onreadystatechange` events that are attached to a single `SCRIPT` element.

**Test Group/Test Category**
- **1308**—Browser Compatibility/Internet Explorer 11
- **1408**—Browser Compatibility/Microsoft Edge

**Severity**
Warning

**Message**
This web application contains both the "onload" and "onreadystatechange" events attached to a single `SCRIPT` element (File: [FILE_NAME], Events: onload, onreadystatechange).
**Background**

The Internet Explorer 11 and later Standards mode includes support for the standards-based and interoperable onload event for SCRIPT elements. Internet Explorer 10 and earlier include support for only the non-interoperable onreadystatechange event for SCRIPT elements. For compatibility with existing web sites, the onreadystatechange event is still supported in Internet Explorer 11 Standards mode. However, sites that register for both onload and onreadystatechange events may now have two callbacks, but in earlier versions of Internet Explorer, there may be only one. A part of the web application functionality may fail to work, or it may produce unexpected results.

**Resolution**

The web application should be re-engineered to use only the onload event for scripts that require a load event.

**See Also**

Script Elements and Event Execution

---

**Flexible Box Changes in CSS Scripts (1324 / 1424)**

For this browser compatibility test, the web application contents are scanned for usage of deprecated vendor prefixes in CSS flexible boxes.

**Test Group/Test Category**

- **1324**—Browser Compatibility/Internet Explorer 11
- **1424**—Browser Compatibility/Microsoft Edge

**Severity**

Warning

**Background**

Since Windows Internet Explorer 11, Microsoft introduced support for the flexible boxes using vendor prefixes. As of Internet Explorer 11, the vendor prefixes in flexible boxes have been replaced with World Wide Web Consortium (W3C) Cascading Style Sheets (CSS) properties, so the old usage is no longer supported.

**Resolution**

The web application should be re-engineered to use replacement for the removed CSS properties.

**See Also**

Flexible Box (“Flexbox”) Layout Updates

---

**Non-Standard Protocol Handlers (1110 / 1210 / 1310)**

For this browser compatibility test, the web application contents are scanned for usage of non-standard protocol handlers.
For this browser compatibility test, the web application contents are scanned for the usage of non-standard protocols in hyperlinks or script redirections.

**Test Group/Test Category**
- **1310**—Browser Compatibility/Internet Explorer 11

**Severity**
Warning

**Messages**
- This web application contains a link with a non-standard protocol "[PROTOCOL]" (File: [FILE_NAME], Link: [PROTOCOL]:[LINK]).
- This web application contains a script that redirects to a URL with a non-standard protocol "[PROTOCOL]" (File: [FILE_NAME], Link: [PROTOCOL]:[LINK]).

**Background**
A protocol name is represented as a prefix of a URL address (for example, http://www.flexerasoftware.com refers to the HTTP protocol and javascript:alert("test") refers to the JavaScript protocol). Developers can register their own application to a URL protocol. In Internet Explorer 11 and later, if an application that is registered to a URL protocol is launched, the Application Protocol Handler dialog box is shown. This security feature protects users from accidental execution of an application with a dangerous or malicious content. This request is made every time that the application is launched, unless the dialog box for that protocol is disabled.

---

**Note** • If no application is registered to a URL protocol, Internet Explorer 11 and later displays information explaining that the web application requires a program that is not installed.

**Resolution**
To prevent Internet Explorer 11 and later from displaying the Application Protocol Handler dialog box after a link is clicked, the user should clear the **Always ask before opening this type of address** check box.

---

**Note** • If no application is configured to handle a non-standard protocol, portions of a web application might fail to work.

**See Also**
Event 1061 - Application Protocol

---

**Removed JavaScript API Features (1322)**

**AdminStudio 2019 | Application Manager**

For this browser compatibility test, the web application contents are scanned for usage of removed JavaScript API features.
Test Group/Test Category

- 1322—Browser Compatibility/Internet Explorer 11

Severity

Warning

Background

Since Windows Internet Explorer 11 (IE11), Microsoft has removed some of the JavaScript Application Programming Interface (API) features. As a result, the applications that rely on the removed standards may be displayed incorrectly or may crash in the occurrence of unhandled exceptions.

Resolution

The web application should be re-engineered to use replacements for the removed JavaScript features.

See Also

Legacy API Additions, Changes and Removals

Request For Comments (RFC) Compliancy (1113, 1213, 1313)

For this browser compatibility test, the web application contents are scanned for the usage of URLs that do not conform to the Request for Comments (RFC) 3986 and 3987 guidelines.

Test Group/Test Category

- 1313—Browser Compatibility/Internet Explorer 11

Severity

Warning

Message

This web application contains a link to an invalid URL according to the Request for Comments (RFC) 3986 and 3987 guidelines (File: [FILE_NAME], Link: [LINK]).

Background

When a URL is entered in the address bar, Internet Explorer 10 and later parse it to verify that it conforms to the RFC guidelines. Centralized URL (CURL) parsing assists in the prevention of malformed URLs that fool Internet Explorer. If the URL does not pass the verification process, Internet Explorer 11 and later allows the web application to appear but restricts its functionality. This might cause the web application to behave unexpectedly.

Resolution

The web application should be re-engineered so that all URLs conform to the RFC 3986 and 3987 guidelines.
Status Bar Scripting (1111 / 1211 / 1311 / 1411)

For this browser compatibility test, the web application contents are scanned for the usage of scripts that attempt to change the content of the status bar. The JavaScript properties that are scanned are `window.status` and `window.defaultStatus`.

Test Group/Test Category
- **1311**—Browser Compatibility/Internet Explorer 11
- **1411**—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains a script that changes status bar messages (File: [FILE_NAME]).

Background
To prevent attackers from spoofing the status bar, Internet Explorer 10 and later browsers by default do not allow web applications in the Internet or Restricted zones to use scripts that set the status bar. As a result, any calls to the JavaScript properties `window.status` or `window.defaultStatus` may fail silently.

Resolution
To allow scripts to set the status bar by using the `window.status` and `window.defaultStatus` methods, a user should clear the **Allow status bar updates via script** check box in the custom security level in the Internet Options settings of Internet Explorer 11 or later.

Release Notes for Internet Explorer 11

Unsupported Cascading Style Sheet (CSS) Features (1114 / 1214 / 1314 / 1414)

For this browser compatibility test, the web application contents are scanned for the usage of cascading style sheet (CSS) features that are not supported by Internet Explorer 11 and later.

Test Group/Test Category
- **1314**—Browser Compatibility/Internet Explorer 11
Chapter 16  Analyze Tests
Browser Compatibility Tests

- 1414—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains an unsupported Cascading Style Sheets (CSS) feature "[FEATURE]" (File: [FILE_NAME]).

Background
Support for the World Wide Web Consortium (W3C) cascading style sheet (CSS) standard has improved in each new release of Internet Explorer. Internet Explorer 11 and later are compliant with CSS 2.1 and supports a significant number of CSS 3 features.

Resolution
The web application should be re-engineered by migrating to supported CSS features.

See Also
CSS Compatibility and Internet Explorer

Unsupported DHTML Editing Control (1102 / 1202 / 1302 / 1402)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the usage of the ActiveX DHTML Editing Control.

Test Group/Test Category
- 1302—Browser Compatibility/Internet Explorer 11
- 1402—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains unsupported DHTML Editing Control (File: [FILE_NAME]).

Background
Windows Vista (which included Internet Explorer 7) and later systems do not have support for the DHTML Editing Control. Support was removed because of security reasons. Web applications that use the safe-for-scripting DHTML Editing Control might fail to load the control. In that case, an image placeholder is displayed instead of the DHTML Editing Control. In addition, any script that references the control might generate exceptions. Because script exceptions terminate the script evaluation, it is likely that unrelated functionality that is controlled by the script might also be rendered inoperative.
Resolution

The web application should be re-engineered to avoid using the DHTML Editing Control. Where this is not feasible, Microsoft provides a downloadable original control in a signed Windows Installer package called DHTMLEd.msi.

⚠️ Caution • Since this workaround leaves applications unchanged, they remain exposed to the same security risks that Microsoft originally identified.

See Also
Replacing the DHTML Editing Control in Windows Vista and Beyond

Unsupported Document Compatibility Modes (1316 / 1416)

For this browser compatibility test, the web application contents are scanned for usage of Document Compatibility Modes.

Test Group/Test Category
- 1316—Browser Compatibility/Internet Explorer 11
- 1416—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains a deprecated Document Compatibility Mode “[ELEMENT]” (File: [FILE_NAME]).

Background
Since Windows Internet Explorer 8, Microsoft introduced document modes to provide maintenance for the features supported by earlier versions of the browser. In Windows Internet Explorer 11 and later, edge mode is the preferred document mode, which represents the highest support for modern standards available to the browser. Starting with IE11, document modes are deprecated and should no longer be used.

Resolution
The web application should be re-engineered not to use document modes.

See Also
Document Modes are Deprecated

Unsupported Fullscreen API (1426)

For this browser compatibility test, the web application contents are scanned for usage of the window.ActiveXObject property.
Test Group/Test Category

- 1426—Browser Compatibility/Microsoft Edge

Severity

Warning

Messages

- This web application contains JavaScript method/property/event \([METHOD_NAME]()\) which will not work in \{OSKeyFull\} (File: [FILE_NAME]).
- This web application contains CSS property \([PROPERTY_NAME]\) which will not work in \{OSKeyFull\} (File: [FILE_NAME]).

Background

Using the fullscreen API, we can direct a user’s attention to specific elements while hiding distracting backgrounds or other apps. The prefixed API works in Internet Explorer 11 and the unprefixed API is intended for Microsoft Edge and beyond.

Resolution

The web application should be re-engineered to use the appropriate API.

See Also

Fullscreen API

Unsupported JavaScript Frameworks (1109 / 1209 / 1309)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the use of legacy JavaScript frameworks that are not compatible with Internet Explorer 11 or later. The frameworks that are scanned are jQuery (earlier than 1.5.1), jQuery UI (earlier than 1.6.8), MooTools (earlier than 1.3), Prototype (earlier than 1.7), and Cufon (earlier than 1.09i).

Test Group/Test Category

- 1309—Browser Compatibility/Internet Explorer 11

Severity

Warning

Messages

- This web application contains unsupported jQuery framework (version \[VERSION\]) (File: [FILE_NAME]).
- This web application contains unsupported jQuery UI framework (version \[VERSION\]) (File: [FILE_NAME]).
- This web application contains unsupported MooTools framework (version \[VERSION\]) (File: [FILE_NAME]).
• This web application contains unsupported Prototype framework (version [VERSION]) (File: [FILE_NAME]).
• This web application contains unsupported Cufon framework (version [VERSION]) (File: [FILE_NAME]).

**Background**

Internet Explorer 11 and later includes new features and changes to existing features for improved standards compliance and interoperability with other web browsers. However, many existing JavaScript frameworks contain functionality that depends on functionality in earlier versions of Internet Explorer. As a result, parts of many popular JavaScript frameworks might not work correctly in Internet Explorer 11 or later Standards mode. Most of these frameworks have already been updated to work correctly in Internet Explorer 11 or later, but many web applications are still using earlier versions of incompatible frameworks.

**Resolution**

A framework compatible with the desired browser version should be delivered by its manufacturer. Where this is not feasible, Internet Explorer 11 Compatibility View should be used. It can be triggered by using the meta attribute value X-UA-Compatible.

**See Also**

Windows Internet Explorer 11 Compatibility with Popular JavaScript Frameworks

**Unsupported Plug-ins for Internet Explorer in the Windows UI (1219 / 1319)**

AdminStudio 2019 | Application Manager

For the 1219 Browser Compatibility test, the web application contents are scanned for the usage of embedded content that requires external plug-ins.

**Test Group/Test Category**

• **1319**—Browser Compatibility/Internet Explorer 11

**Severity**

Warning

**Messages**

• This web application requires Flash Player plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
• This web application requires Java plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
• This web application requires Microsoft Office plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
• This web application requires Open Office plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
• This web application requires Microsoft Silverlight plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
Browser Compatibility Tests

- This web application requires RealOne Player plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires Shockwave plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires Adobe QuickTime plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires Adobe PDF plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires PostScript plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires Microsoft Windows Media Player plugin, which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires unrecognized external plugin (clsid:[VALUE]), which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires unrecognized external plugin (type:[VALUE]), which might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires unrecognized external plugin created dynamically via JavaScript. The plugin might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).
- This web application requires unrecognized external ActiveX control created dynamically via JavaScript. The control might not be loaded in Windows Internet Explorer [VERSION] in the Windows UI (File: [FILE_NAME]).

Background

Internet Explorer 11 and Microsoft Edge supports two browsing experiences: Internet Explorer in the Windows UI and Internet Explorer for the desktop. Although both use the same underlying technology to render web applications, the behavior and experience might differ. For example, Internet Explorer in the Windows UI has limited Adobe Flash support, and it does not support other plug-ins, such as Java applets. Web applications that rely on these technologies may fail to deliver expected content in Internet Explorer 11 and Microsoft Edge in the Windows UI.

Resolution

The web application should be re-engineered by moving to standards-based technologies (including supported HTML5 features) in order to function correctly in Internet Explorer 11 and Microsoft Edge in the Windows UI.

See Also

Internet Explorer on Windows 8.1

Unsupported Plug-ins for Microsoft Edge (1419)

For this browser compatibility test, the web application contents are scanned for the usage of embedded content that requires external plug-ins.
Chapter 16  Analyze Tests
Browser Compatibility Tests

Test Group/Test Category
• 1419—Browser Compatibility/Microsoft Edge

Severity
Warning

Messages
• This web application requires [PLUGIN_NAME] plugin, which might not be loaded in Microsoft Edge (File: [FILE_NAME]).
• This web application requires [CONTROL_NAME] control. The control might not be loaded in Microsoft Edge (File: [FILE_NAME]).

Background
Microsoft Edge presents a clean break from the past, free from the legacy code needed to support ActiveX controls.

Resolution
The web application should be re-engineered by removing ActiveX controls.

See Also
Internet Explorer on Windows 8.1

Unsupported Pointer Events (1323 / 1423)

For this browser compatibility test, the web application contents are scanned for usage of Microsoft pointer events in the JavaScript and Cascading Style Sheets (CSS) code of the web application.

Test Group/Test Category
• 1323—Browser Compatibility/Internet Explorer 11
• 1423—Browser Compatibility/Microsoft Edge

Severity
Warning

Background
Since Windows Internet Explorer 11 and Microsoft Edge, Microsoft has introduced pointer events with vendor prefixes as a replacement of World Wide Web Consortium (W3C) Pointer Events. With Internet Explorer 11 and Microsoft Edge, the Microsoft prefixed versions of pointer events and Application Programming Interfaces (APIs) are no longer supported and might be removed in future releases.
Resolution
The web application should be re-engineered to use technologies other than Microsoft prefixed versions of pointer events and APIs.

See Also
Pointer Event Updates

Unsupported Touch Detection (1121)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for usage of the JavaScript property that returns the number of touch points.

Test Group/Test Category

- **1121**—Browser Compatibility/Internet Explorer 11

Severity
Warning

Background
In Windows Internet Explorer 11 and Microsoft Edge, Microsoft does not support feature detection to determine if the device supports touch screens. In the latest Windows Internet Explorer browser, the property `msMaxTouchPoints` returns the maximum number of touch points supported, but in Internet Explorer 11 and Microsoft Edge, this property always returns undefined.

Resolution
The web application should be re-engineered so that it does not use the `msMaxTouchPoints` property.

See Also
`maxTouchPoints` Property

Unsupported Use of createElement() Method (1103 / 1203 / 1303 / 1403)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the use of angle brackets in arguments that are passed to the `createElement` method.

Test Group/Test Category

- **1103**—Browser Compatibility/Internet Explorer 11
- **1203**—Browser Compatibility/Microsoft Edge
- **1303**—Browser Compatibility/Internet Explorer 11
- **1403**—Browser Compatibility/Microsoft Edge

Severity
Warning
**Message**

This web application contains unsupported characters in the `createElement()` method (File: [FILE_NAME], Argument: [ARGUMENT]).

**Background**

The `createElement` method creates an element node in the Document Object Model (DOM) hierarchy. The Standards mode in Internet Explorer 11 and later does not support the use of angle brackets (`<>`) within the `createElement` method. If the argument of the `createElement` method contains those characters, portions of the web application may fail to work.

**Resolution**

The web application should be re-engineered to no longer use angle brackets in the `createElement` method. The element name should be passed and the `setAttribute` method should be used to set the values of the required attributes.

**See Also**

CreateElement No Longer Supports Angle Brackets

**Unsupported VBScript Code (1321 / 1421)**

For this browser compatibility test, the web application contents are scanned for usage of VBScript code.

**Test Group/Test Category**

- 1321 — Browser Compatibility/Internet Explorer 11
- 1421 — Browser Compatibility/Microsoft Edge

**Severity**

Warning

**Background**

Since Windows Internet Explorer 11, Microsoft deprecated VBScript (Visual Basic Script) code as a scripting language. Web applications displayed in the edge mode will not execute VBScript code.

**Resolution**

The web application that relies on VBScript should be re-engineered to use JavaScript.

**See Also**

VBScript is No Longer Supported in IE11 Edge Mode

**Unsupported Web Cryptography Property (1427)**

For this browser compatibility test, the web application contents are scanned for usage of the `window.ActiveXObject` property.
Test Group/Test Category

- 1427—Browser Compatibility/Microsoft Edge

Severity

Warning

Messages

This web application contains JavaScript property [PROPERTY_NAME] which will not work in {OSKeyFull} (File: [FILE_NAME]).

Background

As of Microsoft Edge, support for the vendor-prefixed version of this property (msCrypto) has been removed.

Resolution

The web application should be re-engineered to use the property Crypto instead of msCrypto.

See Also

crypto Property

Unsupported XML Data Islands (1220 / 1320 / 1420)

For this browser compatibility test, the web application contents are scanned for usage of deprecated XML data islands.

Test Group/Test Category

- 1320—Browser Compatibility/Internet Explorer 11
- 1420—Browser Compatibility/Microsoft Edge

Severity

Warning

Messages

This web application uses deprecated XML data islands.

Background

Since Windows Internet Explorer 11, Microsoft has dropped support for data islands. In order to provide improved interoperability and compliance with HTML5, data islands are now parsed as HTML. This means that XML data islands are now parsed as HTML. This change can impact pages written exclusively for Windows Internet Explorer or pages that use browser sniffing to alter their behavior in Internet Explorer.

Resolution

The following resolutions are available. Note that this issue is not resolved automatically by default.
Manual Fix
The web application should be re-engineered to use other technologies instead of XML data islands. Alternatively, meta
tags can be used to define document compatibility with Internet Explorer 11.

Basic Auto Fix
No resolution is available.

Advanced Auto Fix
No resolution is available.

See Also
XML Data Islands

User-Agent String Detection (1107 / 1207 / 1307 / 1407)

For this browser compatibility test, the web application contents are scanned for the usage of client-side scripts that use
the user-agent string for browser or system detection. Popular JavaScript frameworks (jQuery, jQuery UI, Prototype,
MooTools, Cufon) are excluded from this scan.

Caution • Some web applications use the user-agent string for auxiliary purposes—for example, statistical data collection.
This test might generate false positives for such web applications.

Test Group/Test Category
• 1307—Browser Compatibility/Internet Explorer 11
• 1407—Browser Compatibility/Microsoft Edge

Severity
Warning

Message
This web application contains a script that uses the user-agent string for browser or system detection
(File: [FILE_NAME]).

Background
When a web application is accessed, the user-agent string is sent by the browser to the hosting server. This string indicates
the browser details, including its name, version number, and running platform. The web server can use this information to
provide content that is tailored for this specific browser. Since the user-agent string has been changed in Internet Explorer
11 and later, some web applications using this string might not recognize it and serve incompatible content.
Resolution

The web application should be re-engineered to use feature support detection instead of relying on the user-agent string. Where this is not feasible, the Internet Explorer 11 Compatibility View should be used. It can be triggered by using the meta attribute value X-UA-Compatible.

See Also

Internet Explorer Compatibility Test Guide

XSLT (Extensible Stylesheet Language Transformations) Compatibility (1115 / 1215 / 1315 / 1415)

AdminStudio 2019 | Application Manager

For this browser compatibility test, the web application contents are scanned for the usage of Extensible Stylesheet Language Transformations (XSLT) elements that are not supported in Internet Explorer 11 and later. The features that are scanned are legacy XSL namespaces, legacy stylesheet processing instructions, and XSLT output directives.

Test Group/Test Category

- 1315—Browser Compatibility/Internet Explorer 11
- 1415—Browser Compatibility/Microsoft Edge

Severity

Warning

Message

This web application contains an unsupported XSLT element (ELEMENT) (File: FILE_NAME).

Background

XSLT is a declarative, XML-based language that is used for the transformation of XML documents. To improve standards compliance and interoperability with other browsers, the processing of XML and XSLT files was changed in Internet Explorer 11 and later. In particular, certain non-standard behaviors related to the processing of XSLT files have changed. This might cause the web application to behave unexpectedly or with limited functionality.

Resolution

The web application should be re-engineered by migrating to a supported and standardized XSLT namespace. Migration scenarios have been prepared by Microsoft.

See Also

XSLT Compatibility

Application Virtualization Compatibility Tests

AdminStudio 2019 | Application Manager

AdminStudio’s Analyze offers tests for the compatibility of Windows Installer packages to be converted to virtual formats.
• Installer Analysis Tests

Installer Analysis Tests

AdminStudio uses the application virtualization compatibility installer analysis tests to determine if a Windows Installer package is a suitable candidate for virtualization to Microsoft App-V, VMware ThinApp, Citrix XenApp.

You can choose to customize your test results so that only the virtualization formats that you are interested in are displayed.

• Application Virtualization Compatibility Installer Analysis Tests
• Choosing the Virtual Formats to Display in Test Results

Application Virtualization Compatibility Installer Analysis Tests

AdminStudio uses the following tests to determine if a Windows Installer package is a suitable candidate for virtualization to Microsoft App-V, VMware ThinApp, Citrix XenApp.

• Tests That Return Errors or Warnings
• Tests That Indicate Repackaging is Required

Tests That Return Errors or Warnings

The following tests return errors or warnings for positive test results. An icon indicating the severity of a positive test result is listed in the column of each of the virtual technologies that the test applies to. If the test does not apply to a specific virtualization technology, a gray bar is displayed in that technology’s column.

Table 16-2 • Application Virtualization Compatibility / Installer Analysis Tests

<table>
<thead>
<tr>
<th>Description</th>
<th>App-V 4.x</th>
<th>App-V 5.x</th>
<th>XenApp</th>
<th>ThinApp 4.x</th>
<th>ThinApp 5.x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Windows Installer Package</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>![Icon]</td>
</tr>
</tbody>
</table>

Package is not a valid Windows Installer package. Usually this issue is found in legacy installations that require repackaging.

In rare cases, this issue could also be found in a Windows Installer package that has become corrupted.
This package contains no shortcuts. Shortcuts are necessary to define the entry point into the virtual application.

- **App-V suitability**—For conversion to App-V packages, this issue is acceptable in some scenarios, such as packages that provide dependencies to others that dynamically suite it. However, if this package merely provides a plug-in to another application, it must contain a shortcut to launch that application in this package’s virtual context.

- **ThinApp and XenApp suitability**—For conversion to ThinApp 4.x and XenApp formats, shortcuts are necessary to define the entry point into the virtual application.

One potential resolution to this issue is to use InstallShield Editor to add one or more shortcuts to the Windows Installer package.

**ClickOnce**

Package contains a ClickOnce application.

ClickOnce is a per-user installation format that is often incompatible with the per-machine nature of virtual package deployment. A ClickOnce application also may try to automatically update itself, which results in invalid versioning in the application virtualization client.
Shell Extension

Package contains a shell extension.

Shell extensions extend Windows Explorer and cannot be loaded from a virtual package. This extension may be critical to the use of this application, and, if so, this application will not function when virtualized. However if this extension is non-critical, the application may function when virtualized.

OS Integrated

Package contains files that are closely integrated with the operating system.

The files that make up applications like Internet Explorer or Windows Media Player, or frameworks like the .NET Framework, do not make good candidates for virtualization. These files should instead be installed locally on the machine.

Boot Service

Package contains a service that starts at boot-time.

Virtualized services are limited to the lifetime of the virtual application, so services that must start at boot-time do not make good candidates for virtualization to App-V or XenApp formats. It may be possible to extract this service such that it can be installed locally on the machine and allow the rest of the package to be virtualized.
### Too Large

Package contains more than 4 GB of files.

Since App-V 4.x and XenApp do not support packages that contain more than 4 GB of files, this application cannot be successfully virtualized to App-V 4.x or XenApp as an uncompressed package.

However, if the compressed size of the package is less than 4 GB, then this application can be virtualized to these formats as a compressed package.

### COM Surrogate DLLs

Package contains a COM DLL that uses surrogate virtualization.

App-V, XenApp, and ThinApp do not support COM DLL surrogate virtualization, so this package may not work correctly if virtualized.

### COM Plus

Package contains a COM Plus component.

App-V, XenApp, and ThinApp do not support COM+ components, so this package may not work correctly if virtualized.

### Device Driver

Package contains a device driver.

System-level drivers such as print drivers or USB device drivers do not work from a virtualized environment. It may be possible to extract this driver such that it can be installed locally on the machine and allow the rest of the package to be virtualized.

### 64-Bit Package

Package is a 64-bit package. XenApp and ThinApp 4.x do not support virtualization of 64-bit packages.

---

---

**Figure 16-1:** Informational Messages on Application Virtualization Compatibility Tab
If a package has a positive test result in this category, Automated Application Converter will automatically repackage it on a clean VM before converting it to a virtual package.

Because a positive test result to one of these tests does not have an impact on a package's overall compatibility to be virtualized, a Ready icon is displayed for the package on summary views if these are the only issues that the package has generated. For more information, see Hierarchical Level of Status Icons.

### Table 16-3 • Application Virtualization Compatibility / Installer Analysis Tests That Indicate Repackaging is Required

<table>
<thead>
<tr>
<th>Description</th>
<th>App-V 4.x</th>

<td></td>
</tr>
</tbody>
</table>

| **Unsupported Table** | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) |
| This package contains one or more tables that are not supported by direct conversion. Since these tables may result in the addition or removal of files or registry, the exact set to convert must be determined by repackaging this application. |

| **Custom Action** | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) | ![Green Check](checkmark.png) |
| This package contains one or more unknown custom actions. Since these actions may result in the addition or removal of files or registry, the exact set to convert must be determined by repackaging this application. |

### Choosing the Virtual Formats to Display in Test Results

**AdminStudio 2019 | Application Manager**

All of the tests in the **Installer Analysis** subcategory of the **Application Virtualization Compatibility** test category are always run each time that you run Application Virtualization Compatibility tests in Analyze.

However, if you do not want to display test results for a specific virtual technology, perform the following steps:
Task  To choose the virtual formats to display in test results:

1. On the Application Catalog Analyze tab, click the Select Tests to Execute button in the ribbon. The Select Tests to Execute dialog box opens.

2. Expand the subcategories of the Application Virtualization Compatibility > Installer Analysis category:

3. Under Installer Analysis, clear the selection of the virtual formats that you do not want to display in test results.

4. Click OK.

Best Practices Tests

AdminStudio 2019 | Application Manager

Edition • The following tests are included in AdminStudio Professional and Enterprise Editions:

- Windows Installer Internal Consistency Evaluators
- Windows Installer Best Practices ACE tests
- Remote Desktop Services Tests

The following subcategories of best practice tests are available:

- Windows Installer Internal Consistency Evaluators
- Windows Installer Best Practices Tests
- Microsoft App-V Best Practices Tests
- Web Deploy Best Practices
- Apple Best Practices Tests
Windows Installer Internal Consistency Evaluators

AdminStudio 2019 | Application Manager

Edition • The Windows Installer Internal Consistency Evaluators are included in AdminStudio Professional and Enterprise Editions.

The internal consistency evaluators (ICEs) are tests that you can run to check whether Windows Installer packages are valid databases that perform as expected. These tests validate the data in each table of a package, as well as the data among tables.

Examples of ICEs are:

- ICE08: Each component has a unique component code.
- ICE09: Any component that is being installed to the Windows System folder is marked as permanent.
- ICE12, ICE75, and others: custom actions are scheduled at valid times in the installation sequences.

Analyze includes more than 100 ICE tests. ICE tests are stored in .cub files, which are Windows Installer-format databases that perform custom actions that validate data in Windows Installer databases.

About ICE43, ICE50, and ICE57 Tests for Shortcuts

AdminStudio 2019 | Application Manager

Edition • These tests are included in AdminStudio Professional and Enterprise Editions.

Each entry in the CreateLink section of the .inc file is converted into an entry in the Shortcut table. The exact properties of the shortcut depends on the information in the CreateLink line as well as the nature of the target file itself.

ICE43, ICE50, and ICE57 are the most common validation tests for shortcuts.

Shortcut Types

The primary distinction between shortcuts is advertised vs. non-advertised. Here are two reasons why it is preferable to create advertised shortcuts:

- Advertised shortcuts are triggers for MSI's self-repair mechanism.
- Non-advertised shortcuts are intended for a per-user context only:
  - The target file must be a file installed in a user-specific directory.
  - The key path of the component that contains the target file must be a user-specific registry value.
Conversion from CreateLink Entries to Shortcut Table Entries

The `.inc` converter always tries to create advertised shortcuts for every `CreateLink` line that is found in the `.inc` file. However, not every `CreateLink` line can be converted into an advertised shortcut.

To create an advertised shortcut, the information in the `CreateLink` line must meet all of the following requirements:

- The target file must be the key path of its component. This means that the target file must be listed in the `.inc` file list. The converter will create a new component for a non-PE (portable executable) target files, so that it is guaranteed to become the key path of the component. (Normally, for each target directory, non-PE files are grouped together into one component).
- The target file must contain an icon.

In general, this means that as long as the target file contains an icon, the converter is able to create an advertised shortcut for it. However, whenever a shortcut cannot be advertised, the converter does the following:

- It creates a “catch all” component (if not yet created) named `ShortcutsComponent`. It also creates an HKCU registry entry in the Registry table, and that entry is used as the key path for `ShortcutsComponent`. This is done to avoid ICE43.
- A new shortcut entry is created in the Shortcut table, and it is associated with `ShortcutsComponent`.

</tbody>
</table>
ACE04: Components Without Files or Key Paths

AdminStudio 2019 | Application Manager

**Edition** • This test is included in AdminStudio Professional and Enterprise Editions.

ACE04 verifies that components with no files and no key paths have an associated entry in the CreateFolder table according to Windows Installer best practices.

**Test Group/Test Category/Test Subcategory**

Best Practices/Windows Installer Best Practices/Components

**Severity**

Error

**Message**

The component [COMPONENT1] in the package [PACKAGE1] does not have a key file, a key path, or an associated entry in the CreateFolder table.

**Background**

ACE04 is designed to identify and fix the same issue that ICE18 detects. It flags components that have an empty KeyPath column, that do not have any files, and that also do not have associated entries in the RemoveFile, DuplicateFile, and MoveFile tables.

**Table 16-4 • Windows Installer Best Practice Tests**

</tbody>
</table>
Resolution

Automatic Fix (CARD04)

CARD04 creates a CreateFolder table entry for the component by executing the following query:

```sql
INSERT INTO CreateFolder ( `Directory_`, `Component_` )
VALUES ( 'Source Directory', 'Source Component' )
```

See Also
CreateFolder Table
CreateFolderTable (on MSDN)
Conflict Application Resolution Definitions (CARDs)

ACE05: More Than One Executable File Per Component

ACE05 checks for the existence of more than one executable file (.exe, .dll, .ocx, .hlp, .chm, .tlb, .sys, .drv) per component in a Windows Installer package.

Test Group/Test Category/Test Subcategory
Best Practices/Windows Installer Best Practices/Components

Severity
Error

Message

Background
If more than one executable file (.exe, .dll, .ocx, .hlp, .chm, .tlb, .sys, .drv) exists in a component, ACE05 fails.

Resolution

Automatic Fix (CARD05)

CARD05 automatically modifies the component so that only one .exe or .dll exists, and it adds new components for remaining .exe, .dll, .ocx, .hlp, .chm, .tlb, .sys, and .drv files. To do this, CARD05 generates a new component name and ComponentId and inserts a record in the Component table and in the FeatureComponents table. The relevant entry in the File table is then updated to effectively move the file into the new component.

See Also
Conflict Application Resolution Definitions (CARDs)
ACE06: Executable File Not Marked as Key File of Component

**AdminStudio 2019 | Application Manager**

*Edition* • This test is included in AdminStudio Professional and Enterprise Editions.

ACE06 checks whether the executable file (.exe, .dll, .ocx, .hlp, .chm, .tlb, .sys, .drv) within the component is the key file.

**Test Group/Test Category/Test Subcategory**

Best Practices/Windows Installer Best Practices/Components

**Severity**

Error

**Message**

The component [COMPONENT1] in the package [PACKAGE1] does not have an executable module (*.chm, *.dll, *.drv, *.exe, *.hlp, *.ocx, *.sys, or *.tlb) as the key file. The current key file [NON-EXECUTABLE_FILENAME] can be replaced with [EXECUTABLE_MODULE_FILENAME].

**Background**

If an executable file is not the key file of its component, ACE06 fails.

**Resolution**

**Automatic Fix (CARD06)**

CARD06 automatically makes the executable file the key file of its component. To do this, CARD06 runs the following query and replaces the key path with a file entry from the File column of the File table; the file entry is associated with this component and of the correct type.

```
SELECT `KeyPath` FROM `Component` WHERE `ComponentId` = 'Source ComponentId'
```

Conflict Application Resolution Definitions (CARDs)

ACE25: Hard-Coded Paths for Custom Action Targets

**AdminStudio 2019 | Application Manager**

*Edition* • This test is included in AdminStudio Professional and Enterprise Editions.

ACE25 checks the entries in the CustomAction table to identify any hard-coded paths.

**Test Group/Test Category/Test Subcategory**

Best Practices/Windows Installer Best Practices/Recommended Rules
Chapter 16  Analyze Tests
Best Practices Tests

Severity
Warning

Message
The \texttt{[CUSTOM\_ACTION\_NAME]} custom action has a hard-coded directory path of \texttt{[TARGET\_PATH]} in its Target field.

Background
If a package has a hard-coded path in the Target column of the CustomAction table, ACE25 fails.

Resolution
Manual Fix
Open the package file in InstallShield Editor, and in the Target column of the CustomAction table, change any hard-coded paths to relative paths.

ACE26: Merge Modules That Are Missing from the Application Catalog

\texttt{Edition} \textbullet This test is included in AdminStudio Professional and Enterprise Editions.

ACE26 checks whether the Merge Modules in a package are present in the Application Catalog.

Test Group/Test Category/Test Subcategory
Best Practices/Windows Installer Best Practices/Merge Module Integrity

Severity
Warning

Message
The \texttt{[MERGE\_MODULE\_NAME]}, version \texttt{[VERSION]} Merge Module is included with this package and yet not imported into the Application Catalog. It is recommended that all Merge Modules be imported into the Application Catalog.

Background
If a package refers to a Merge Module that does not exist in the Application Catalog, ACE26 fails.

\texttt{Note} \textbullet ACE26 and ACE36, optional Best Practice ACEs, both check for conflicts with Merge Modules. ACE26 checks merge modules that are listed in the ModuleSignature table, while ACE36 checks the ModuleDependency table.
These ACEs are provided to encourage you to import Merge Modules into the Application Catalog and, by doing so, improve the effectiveness of ACE12, which checks for components that contain files that could be replaced by one of the imported Merge Modules.

**Resolution**

**Manual Fix**

To resolve this issue, open the package file in Application Catalog and import the identified Merge Module into the Application Catalog.

**See Also**

ACE12: Files from Merge Modules

---

**ACE27: Duplicate File Data Without the Required Standard Actions**

AdminStudio 2019 | Application Manager

*Edition* • This test is included in AdminStudio Professional and Enterprise Editions.

ACE27 checks whether data in the DuplicateFile table is executed with an associated DuplicateFiles standard action.

**Test Group/Test Category/Test Subcategory**

Best Practices/Windows Installer Best Practices/Recommended Rules

**Severity**

Warning

**Message**

The package contains data ([FileKey]) in the 'DuplicateFile' table but not the necessary actions to use this data. You should consider whether a 'DuplicateFiles' or 'RemoveDuplicateFiles' action is needed for your 'InstallExecuteSequence' table.

**Background**

If a package contains data in the DuplicateFile table but not the necessary actions to use this data, ACE27 fails.

**Resolution**

**Manual Fix**

To resolve this issue, determine whether a DuplicateFiles action or a RemoveDuplicateFiles action is needed for your InstallExecuteSequence table. If so, either open the MSI file in InstallShield Editor and add the appropriate action to the InstallExecuteSequence table, or remove the unused data from the DuplicateFile table.
ACE28: Hard-Coded Paths for Environment Variable Values

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

ACE28 checks the entries of the Environment table to identify hard-coded paths.

Test Group/Test Category/Test Subcategory
Best Practices/Windows Installer Best Practices/Recommended Rules

Severity
Warning

Message
The [ENVIRONMENT_TABLE_NAME] Environment table entry has a hard coded directory path of [DIRECTORY_PATH] in its Value field.

Background
If the Value column of the Environment table in a package contains any hard-coded paths, ACE28 fails.

Resolution
Manual Fix
To resolve this issue, open the package file in InstallShield Editor and change any hard-coded paths in the Value column of the Environment table to relative paths.

ACE29: Hard-Coded Paths for INI File Changes

AdminStudio 2019 | Application Manager

ACE29 checks the entries in the IniFile table to identify hard-coded paths.

Test Group/Test Category/Test Subcategory
Best Practices/Windows Installer Best Practices/Recommended Rules

Severity
Warning

Message
The [PATH_NAME]\[INI_FILE_NAME] INI file has a hard coded directory path of [HARD_CODED_PATH] in its Value field.
**Background**

If the Value column of the IniFile table of a package contains any hard-coded paths, ACE29 fails.

**Resolution**

**Manual Fix**

To resolve this issue, open the package file in InstallShield Editor and change any hard-coded paths in the Value column of the IniFile table to relative paths.

---

**ACE31: MoveFile Data Without the Required Standard Actions**

*AdminStudio 2019 | Application Manager*

---

**Edition**

This test is included in AdminStudio Professional and Enterprise Editions.

ACE31 checks whether data in the MoveFile table is being executed with an associated MoveFiles standard action.

**Test Group/Test Category/Test Subcategory**

Best Practices/Windows Installer Best Practices/Recommended Rules

**Severity**

Warning

**Message**

The package contains data ([FileKey]) in the 'MoveFile' table but not the necessary actions to use this data. You should consider whether a 'MoveFiles' action is needed for your 'InstallExecuteSequence' table.

**Background**

If a package contains data in the MoveFile table but not the necessary actions to use this data, ACE31 fails.

**Resolution**

**Manual Fix**

To resolve this issue, determine whether a MoveFiles action is needed for your InstallExecuteSequence table. If so, either open the MSI file in InstallShield Editor and add the appropriate action to the InstallExecuteSequence table, or remove the unused data from the MoveFile table.
ACE32: Hard-Coded Paths in Registry Entries

ACE32 checks the entries of the registry table to identify hard-coded paths.

**Test Group/Test Category/Test Subcategory**
Best Practices/Windows Installer Best Practices/Recommended Rules

**Severity**
Warning

**Message**
The [REGISTRY_TABLE_ENTRY_NAME] Registry table entry has a hard coded directory path of [DIRECTORY_PATH_NAME] in its Value field.

**Background**
If the Value column of the Registry table of a package contains any hard-coded paths, ACE32 fails.

**Resolution**

**Manual Fix**
To resolve this issue, open the package file in InstallShield Editor and change any hard-coded paths in the Value column of the Registry table to relative paths.

ACE33: RemoveFile Data Without the Required Standard Actions

ACE33 checks whether data in the RemoveFile table is being executed with an associated RemoveFiles action.

**Test Group/Test Category/Test Subcategory**
Best Practices/Windows Installer Best Practices/Recommended Rules

**Severity**
Warning
Message
The package contains data ([FileKey]) in the 'RemoveFile' table but not the necessary actions to use this data. You should consider whether a 'RemoveFiles' action is needed for your 'InstallExecuteSequence' table.

Background
If a package contains data in the RemoveFile table but not the necessary actions to use this data, ACE33 fails.

Resolution

Manual Fix
To resolve this issue, determine whether a RemoveFiles action is needed for your InstallExecuteSequence table. If so, either open the MSI file in InstallShield Editor and add the appropriate action to the InstallExecuteSequence table, or remove the unused data from the RemoveFile table.

ACE34: RemoveIniFile Data Without the Required Standard Actions

Test Group/Test Category/Test Subcategory
Best Practices/Windows Installer Best Practices/Recommended Rules

Severity
Warning

Message
The package contains data ([RemoveIniFile]) in the 'RemoveIniFile' table but not the necessary actions to use this data. You should consider whether a 'RemoveIniFiles' action is needed for your 'InstallExecuteSequence' table.

Background
If a package contains data in the RemoveIniFile table but not the necessary actions to use this data, ACE34 fails.

Resolution

Manual Fix
To resolve this issue, determine whether a RemoveIniFiles action is needed for your InstallExecuteSequence table. If so, either open the MSI file in InstallShield Editor and add the appropriate action to the InstallExecuteSequence table, or remove the unused data from the RemoveIniFile table.
ACE35: RemoveRegistry Data Without the Required Standard Actions

**Test Group/Test Category/Test Subcategory**
Best Practices/Windows Installer Best Practices/Recommended Rules

**Severity**
Warning

**Message**
The package contains data ([RemoveRegistry]) in the 'RemoveRegistry' table but not the necessary actions to use this data. You should consider whether a 'RemoveRegistryValues' action is needed for your 'InstallExecuteSequence' table.

**Background**
If a package contains data in the RemoveRegistry table but not the necessary actions to use this data, ACE35 fails.

**Resolution**

**Manual Fix**
To resolve this issue, determine whether a RemoveRegistryValues action is needed for your InstallExecuteSequence table. If so, either open the MSI file in InstallShield Editor and add the appropriate action to the InstallExecuteSequence table, or remove the unused data from the RemoveRegistry table.

ACE36: Merge Module Dependencies That Are Missing from the Application Catalog

**Test Group/Test Category/Test Subcategory**
Best Practices/Windows Installer Best Practices/Merge Module Integrity

**Severity**
Warning

**Message**
ACE36 checks whether a package's Merge Module dependencies are present in the Application Catalog.
Message

The required [MERGE_MODULE_NAME], version [REQUIRED_VERSION] Merge Module is included with this package and yet not imported into the Application Catalog. It is recommended that all Merge Modules be imported into the Application Catalog.

Background

If any of a package's Merge Module dependencies do not exist in the Application Catalog, ACE36 fails.

Note • ACE26 and ACE36, optional Best Practice ACEs, both check for conflicts with Merge Modules. ACE26 checks merge modules that are listed in the ModuleSignature table, while ACE36 checks the ModuleDependency table.

These ACEs are provided to encourage you to import Merge Modules into the Application Catalog and, by doing so, improve the effectiveness of ACE12, which checks for components that contain files that could be replaced by one of the imported Merge Modules.

Resolution

Manual Fix

Import the package’s missing Merge Modules into the Application Catalog.

ACE12: Files from Merge Modules

Microsoft App-V Best Practices Tests

AdminStudio 2019 | Application Manager

The following Microsoft App-V best practices ACE tests are described in this section:

- ACE201: Shortcuts with Hard-Coded Paths for Targets
- ACE202: Shortcuts with Hard-Coded Paths in Command-Line Arguments
- ACE208: App-V Packages Without at Least One Shortcut
- ACE209: App-V Packages with Shell Extensions
- ACE210: App-V Packages with ClickOnce Support
- ACE211: App-V Package with DLL Surrogates
- ACE212: App-V Packages with Boot Services
- ACE213: App-V Packages with OS Integrated Files
- ACE214: App-V Packages with Drivers
- ACE216: App-V Package with Long .sft File Names
- ACE217: App-V Packages with WMI Providers
ACE218: App-V Package with a J2EE Application Server
ACE219: App-V Packages with ASP.NET or IIS Components
ACE220: App-V Packages with Unsupported Applications

ACE201: Shortcuts with Hard-Coded Paths for Targets

ACE201 checks whether a target in the package has a hard-coded path, such as C:\...\, which may not be present in a virtual environment.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Warning

Message
Package [PACKAGE_NAME] has a shortcut named [NAME] with a hardcoded Target of [TARGET].

Background
If a shortcut in package has a hard-coded path, ACE201 fails.

Resolution
Manual Fix
To resolve this ACE in an App-V package, change the path of the target to use a variable instead of a hard-coded path.

Task

To resolve this issue:

1. Open the App-V package in the Virtual Package Editor.
2. In the View List under Application Data, click Shortcuts.
3. In the Targets explorer, select the target that contains the hard-coded path.
4. In the Target setting, replace the existing hard-coded path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64.

Note • If there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter.
ACE202: Shortcuts with Hard-Coded Paths in Command-Line Arguments

ACE202 checks whether a command-line argument for a target in the package includes a hard-coded path, such as \C:...\, which may not be present in a virtual environment.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Warning

Message
Package [PACKAGE_NAME] has a shortcut named [NAME] with a hardcoded argument of [ARGUMENTS].

Background
If a command-line argument for a target in the package includes a hard-coded path, ACE202 fails.

Resolution
Manual Fix
To resolve this ACE in an App-V package, change the path to use a variable instead of a hard-coded path.

Task To resolve this issue:

1. Open the App-V package in the Virtual Package Editor.
2. In the View List under Application Data, click Shortcuts.
3. In the Targets explorer, select the target that contains the hard-coded path.
4. In the Arguments setting, replace the existing path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64—instead of the hard-coded path.

Note • If there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter.

ACE203 checks whether a working directory for a target in the package includes a hard-coded path, such as \C:...\, which may not be present in a virtual environment.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices
Severity
Warning

Message
Package [PACKAGE_NAME] has a shortcut named [NAME] with a hardcoded working directory of [DIRECTORY_NAME].

Background
If the package contains a shortcut target whose working directory is a hard-coded path, ACE203 fails.

Resolution

Manual Fix
To resolve this ACE in an App-V package, change the path to use a variable instead of a hard-coded path.

Task
To resolve this issue:

1. Open the App-V package in the Virtual Package Editor.
2. In the View List under Application Data, click Shortcuts.
3. In the Targets explorer, select the target that contains the hard-coded path.
4. In the Working Directory setting, replace the existing path with a path that uses a CSIDL constant or an SFT constant—such as CSIDL_APPDATA or SFT_PROGRAM_FILES_X64—instead of the hard-coded path.

Note • If there is no appropriate CSIDL or SFT constant, you may need to use a hard-coded path that starts with a drive letter.

ACE208: App-V Packages Without at Least One Shortcut

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Warning

Message
Package [PACKAGE_NAME] has no shortcuts.
Background

If the App-V package does not contain any shortcuts, ICE208 fails.

Resolution

Manual Fix

You can ignore this ACE if one of the following is true:

- This package is intended to be used as a dependency by a different App-V package through Dynamic Suite Composition. In this case, you need to edit the other App-V package in the Virtual Package Editor and select this App-V package as a dependency in the Dependencies view.

- This package is intended to be used as a plug-in. In this case, you need to create a shortcut to the application for which this is a plug-in. Some common examples include Office and Internet Explorer.

If end users need to be able to launch this App-V package independently, consider opening the package in the Virtual Package Editor and adding a target to the App-V package if necessary (through the Shortcuts view), and then adding a shortcut to the target.

ACE209: App-V Packages with Shell Extensions

ACE209 checks App-V packages for shell extensions.

Test Group/Test Category

Best Practices/Microsoft App-V Best Practices

Severity

Warning

Message

Package [PACKAGE_NAME] has shell extensions.

Background

If an App-V package has a shell extension, ACE209 fails.

Resolution

Manual Fix

You need to assess how important the shell extension is to the application so that you can determine if it matters whether the shell extension behaves as intended. You then need to do one of the following:

- If the shell extension is unimportant, it is probably safe to deploy the package with slightly reduced functionality.

- If the shell extension is important, this package will not function well, and it should not be deployed.
ACE210: App-V Packages with ClickOnce Support

ACE210 checks App-V packages for ClickOnce installations.

**Test Group/Test Category**
Best Practices/Microsoft App-V Best Practices

**Severity**
Warning

**Message**
Package [PACKAGE_NAME] has ClickOnce.

**Background**
If an App-V package has a ClickOnce installation, ACE210 fails.

**Resolution**

**Manual Fix**
You need to assess how important the ClickOnce installation is to the application so that you can determine if it matters whether the ClickOnce installation behaves as intended. You then need to do one of the following:

- **If the ClickOnce installation is unimportant**, it is probably safe to deploy the package with slightly reduced functionality.
- **If the ClickOnce installation is important**, this package will not function well, and it should not be deployed.

ACE211: App-V Package with DLL Surrogates

ACE211 checks App-V packages for DLL surrogates.

**Test Group/Test Category**
Best Practices/Microsoft App-V Best Practices

**Severity**
Error

**Message**
Package [PACKAGE_NAME] has dll surrogates.

**Background**
If an App-V package has a DLL surrogate, ACE211 fails.
Resolution

Manual Fix

You need to assess how important the DLL surrogate is to the application so that you can determine if it matters whether the DLL surrogate behaves as intended. You then need to do one of the following:

- **If the DLL surrogate is unimportant**, it is probably safe to deploy the package with slightly reduced functionality.
- **If the DLL surrogate is important**, this package will not function well, and it should not be deployed.

ACE212: App-V Packages with Boot Services

ACE212 checks App-V packages for boot services.

Test Group/Test Category

Best Practices/Microsoft App-V Best Practices

Severity

Error

Message

Package [PACKAGE_NAME] has boot services.

Background

If an App-V package has boot services, ACE212 fails.

Resolution

Manual Fix

You need to assess how important the boot service is to the application so that you can determine if it matters whether the boot service behaves as intended. You then need to do one of the following:

- **If the boot service is unimportant**, it is probably safe to deploy the package with slightly reduced functionality.
- **If the boot service is important but separable**, install the boot service on the main machine, and virtualize the rest of the application. A modified virtual package can then be deployed successfully.
- **If the boot service is important but not separable**, this package will not function well, and it should not be deployed.

ACE213: App-V Packages with OS Integrated Files

ACE213 checks App-V packages for OS integrated files.
Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Error

Message
Package [PACKAGE_NAME] has OS integrated files.

Background
If an App-V package has an OS integrated file, ICE212 fails.

Resolution
It is likely that the OS integrated file is central to the virtual package. Therefore, it is recommended that this App-V package not be deployed.

ACE214: App-V Packages with Drivers

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Error

Message
Package [PACKAGE_NAME] has drivers.

Background
If an App-V package has a driver, ACE214 fails.

Resolution
Manual Fix
Separate the drivers from the rest of the application so that the drivers can be installed on the main machine. Then, virtualize the rest of the application.
ACE216: App-V Package with Long .sft File Names

ACE216 checks whether an App-V package’s .sft file name contains more than 56 characters.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Error

Message
Package [PACKAGE_NAME] has a SFT filename that is too long (> 56 characters).

Background
If the .sft file for the App-V package contains more than 56 characters, ACE216 fails.

Resolution
Manual Fix
To resolve this ACE in an App-V package, rename the .sft file with a name that contains fewer than 56 characters.

ACE217: App-V Packages with WMI Providers

ACE217 checks whether the App-V package contains a WMI Provider component.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Error

Message
WMI provider [PROVIDER_NAME] was found in package [PACKAGE_NAME].

Background
If an App-V package includes a WMI Provider component, ACE217 fails.
Resolution

Manual Fix

If the WMI Provider is not an important part of the application, or if it can be separately installed from the App-V package, this error can be suppressed and ignored.

ACE218: App-V Package with a J2EE Application Server

ACE218 checks whether the App-V package contains a J2EE application server.

Test Group/Test Category

Best Practices/Microsoft App-V Best Practices

Severity

Error

Message

Files such as [FILE_NAME] indicate that a J2EE application server is in package [PACKAGE_NAME].

Background

If an App-V package includes a J2EE application server, ACE218 fails.

Resolution

Manual Fix

If the J2EE application is not an important part of the application, or if it can be separately installed from the App-V package, this error can be suppressed and ignored.

ACE219: App-V Packages with ASP.NET or IIS Components

ACE219 checks whether the App-V package contains an ASP.NET or IIS application component.

Test Group/Test Category

Best Practices/Microsoft App-V Best Practices

Severity

Error

Message

Files such as [FILE_NAME] indicate that an ASP.NET application is in package [PACKAGE_NAME].
Background
If an App-V package includes an ASP.NET or IIS application component, ACE219 fails.

Resolution
Manual Fix
If the ASP.NET/IIS application is not an important part of the application, or if it can be separately installed from the App-V package, this error can be suppressed and ignored.

ACE220: App-V Packages with Unsupported Applications
ACE220 checks whether an App-V package contains files that indicate that the package includes unsupported applications such as antivirus software or server software such as Exchange Server or SQL Server.

Test Group/Test Category
Best Practices/Microsoft App-V Best Practices

Severity
Warning or error

Message
Files such as [FILE_NAME] indicate that the unsupported application [APPLICATION_NAME] is in package [PACKAGE_NAME].

Background
If an App-V package contains files that indicate that the package includes unsupported applications such as antivirus software or server software such as Exchange Server or SQL Server, ACE220 fails.

Resolution
Manual Fix
If these unsupported application components are not an important part of the application, or if they can be separately installed from the App-V package, this error can be suppressed and ignored.

Web Deploy Best Practices
The following categories of web deploy best practices tests are described in this section:

- WD001: Deprecated Parameter Types
- WD002: Constraint of Parameter Scopes
WD001: Deprecated Parameter Types

AdminStudio 2019 | Application Manager

WD001 scans the web deploy package for the use of the deprecated parameter types.

Test Group/Test Category
Best Practices/Web Deploy Best Practices

Severity
Warning

Message
The file present in the Web Deploy Package contains the deprecated parameter type.

See Also
Package an Application for the Windows Web Application Gallery

WD002: Constraint of Parameter Scopes

AdminStudio 2019 | Application Manager

WD002 scans the web deploy package for the constraint of parameter scopes.

Test Group/Test Category
Best Practices/Web Deploy Best Practices

Severity
Warning

Message
The file present in the Web Deploy Package contains the parameter Entry node of kind XmlFile which has the scope attribute that don't end with '$'.

See Also
Package an Application for the Windows Web Application Gallery

Apple Best Practices Tests

AdminStudio 2019 | Application Manager

The following Apple Best Practices tests are described in this section:

- M001: Recommended Policy Keys are Specified to Ensure Proper Classification of the Application (Info.plist)
- M002: Default Policy Keys are Defined When Device-Specific Versions are Present
- M003: Localization Resources are Present and Contain All Required Information
• M004: Localization Resources are Present and Contain the Recommended Keys
• MAC701: Recommended Property List Keys
• MAC702: Code Signature
• MAC703: Volume Purchase Program
• MAC704: Allows In-app Purchases

**M001: Recommended Policy Keys are Specified to Ensure Proper Classification of the Application (Info.plist)**

AdminStudio 2019 | Application Manager
M001 verifies that policy keys are specified in the application profile.

**Test Group/Test Category**
Best Practices/Apple Best Practices

**Severity**
Warning

**See Also**
Apple iOS Dev Center

**M002: Default Policy Keys are Defined When Device-Specific Versions are Present**

AdminStudio 2019 | Application Manager
M002 verifies that default policy keys are defined.

**Test Group/Test Category**
Best Practices/Apple Best Practices

**Severity**
Warning

**See Also**
Apple iOS Dev Center

**M003: Localization Resources are Present and Contain All Required Information**

AdminStudio 2019 | Application Manager
M003 verifies that location resources are complete.
M004: Localization Resources are Present and Contain the Recommended Keys

AdminStudio 2019 | Application Manager

M004 verifies that the recommended keys for localization are present.

MAC701: Recommended Property List Keys

AdminStudio 2019 | Application Manager

For the MAC701 Apple Best Practices test, the macOS application is scanned to determine if it contains the recommended property list keys. If it does not contain the recommended property list keys, a warning is generated.
MAC702: Code Signature

For the MAC702 Apple Best Practices test, the macOS application is scanned to determine if it contains a digital signature. If it does not contain a digital signature, a warning is generated.

**Test Group/Test Category**
Best Practices/Apple Best Practices

**Severity**
Warning

**See Also**
Apple iOS Dev Center

MAC703: Volume Purchase Program

For the MAC703 Apple Best Practices test, the macOS application is scanned to determine if it is enabled for the Volume Purchase Program.

**Test Group/Test Category**
Best Practices/Apple Best Practices

**Severity**
Warning

**See Also**
Apple iOS Dev Center

MAC704: Allows In-app Purchases

For the MAC704 Apple Best Practices test, the macOS application is scanned to determine if it allows in-app purchases.

**Test Group/Test Category**
Best Practices/Apple Best Practices

**Severity**
Warning

M4001: Application Requires Telephony

AdminStudio 2019 | Application Manager

M4004 scans the mobile app for the presence of telephony usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.
**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
App Capability Declarations

---

**M4002: Application Requires Wi-Fi**

AdminStudio 2019 | Application Manager

M4002 scans the mobile app for the presence of wireless networking usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
App Capability Declarations
Developing Connected Applications

---

**M4003: SMS Scheme**

AdminStudio 2019 | Application Manager

M4003 scans the mobile app for the presence of SMS scheme usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.
See Also
App Capability Declarations

M4004: Application Uses a Camera

AdminStudio 2019 | Application Manager
M4004 scans the mobile app to determine if it uses the device camera.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
App Capability Declarations

M4006: Application Uses a Front-Facing Camera

AdminStudio 2019 | Application Manager
M206 scans the mobile app to determine if it uses a front-facing camera.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
App Capability Declarations

M4008: Application Uses a Video Camera

AdminStudio 2019 | Application Manager
M4008 scans the mobile app to determine if it uses the video camera.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
App Capability Declarations

**M4010: Application Uses a Gyroscope**
AdminStudio 2019 | Application Manager
M210 scans the mobile app to determine if it uses the device gyroscope.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
App Capability Declarations

**M4011: Application Uses Location Services**
AdminStudio 2019 | Application Manager
M4011 scans the mobile app to determine if it uses location services.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
App Capability Declarations

M4013: Application Uses a Magnetometer

AdminStudio 2019 | Application Manager

M213 scans the mobile app to determine if it uses the device magnetometer.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
App Capability Declarations

M4015: Application Uses the Microphone

AdminStudio 2019 | Application Manager

M215 scans the mobile app to determine if it uses the device microphone.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

M4053: Application Uses HID

AdminStudio 2019 | Application Manager

M4053 scans the mobile app to determine if it allows access to devices that support the Human Interface Device (HID) protocol.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
App Capability Declarations

M4054: Application Uses POS

AdminStudio 2019 | Application Manager

M4054 scans the mobile app to determine if it accesses the point of service (POS) API which lets your Windows Store app access bar code scanners and magnetic stripe readers.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

App Capability Declarations

M4057: Application Accesses Local Video Library

AdminStudio 2019 | Application Manager

M4057 scans the mobile app to determine if it allows programmatic access to the user’s Videos, allowing the app to enumerate and access all files in the library without user interaction. This capability is typically used in movie-playback apps that make use of the entire Video library.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category

Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment
### M4058: Application Accesses Local Music Library

AdminStudio 2019 | Application Manager

M4058 scans the mobile app to determine if it allows programmatic access to the user’s Music, allowing the app to enumerate and access all files in the library without user interaction. This capability is typically used in jukebox apps that make use of the entire Music library.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

#### Test Group/Test Category
Best Practices/Mobile Risk Assessment/Windows Mobile Risk Assessment

#### Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

Android Mobile Risk Assessment Tests

AdminStudio 2019 | Application Manager

The following Android mobile risk assessment tests are described in this section:

- M201: Application Requires Telephony
- M202: Application Requires Wi-Fi
- M203: Application Requires SMS Scheme
- M204: Application Uses a Camera
- M205: Application Uses an Auto-Focus Camera
- M206: Application Uses a Front-Facing Camera
- M207: Application Uses a Camera Flash
- M208: Application Uses a Video Camera
- M209: Application Uses an Accelerometer
- M210: Application Uses a Gyroscope
- M211: Application Uses Location Services
- M212: Application Uses GPS
- M213: Application Uses a Magnetometer
- M215: Application Uses the Microphone
- M220: Application Uses Peer-to-Peer via Bluetooth
- M221: Application Uses Bluetooth LE
- M230: Application Accesses the Address Book
- M231: Application Supports In-App Purchases
- M232: Application Supports Social Networking
- M235: Application Uses a Low-Latency Audio Pipeline
- M236: Application Uses the Consumer IR Capabilities on the Device
- M237: Application Uses the NFC Card Emulation Feature in the Device
- M238: Application Uses the Barometer in the Device
- M239: Application Uses the Device Light Sensor
- M240: Application Uses the Device Proximity Sensor
- M241: Application Uses the Step Device Detector
- M242: Application Requires Landscape Orientation
- M243: Application Requires Portrait Orientation
- M244: Application is Designed for a Television User Experience
- M245: Application Uses USB Feature
- M246: Application Accesses the Calendar
- M247: Application Uses Device Admin
M201: Application Requires Telephony

AdminStudio 2019 | Application Manager

M201 scans a mobile app for the presence of telephony usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M202: Application Requires Wi-Fi

AdminStudio 2019 | Application Manager

M202 scans the mobile app for the presence of wireless networking usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.

• If the application calls the feature’s APIs, a Warning is generated.

M238: Application Uses the Barometer in the Device

AdminStudio 2019 | Application Manager

**Edition** • The Android Mobile Risk Assessment tests are included in AdminStudio Professional Edition Mobile and AdminStudio Enterprise Edition Mobile.

M238 scans the mobile app to determine if it uses the barometer in the device.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Google Android `<uses-feature>`
M239: Application Uses the Device Light Sensor

AdminStudio 2019 | Application Manager

M239 scans the mobile app to determine if it uses the device light sensor.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M240: Application Uses the Device Proximity Sensor

AdminStudio 2019 | Application Manager

M240 scans the mobile app to determine if it uses the device proximity sensor.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M241: Application Uses the Step Device Detector

AdminStudio 2019 | Application Manager

M241 scans the mobile app to determine if it uses the device step detector.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M242: Application Requires Landscape Orientation

AdminStudio 2019 | Application Manager

M242 scans the mobile app to determine if it requires landscape orientation.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M243: Application Requires Portrait Orientation

AdminStudio 2019 | Application Manager

M243 scans the mobile app to determine if it requires portrait orientation.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M244: Application is Designed for a Television User Experience

AdminStudio 2019 | Application Manager

M244 scans the mobile app to determine if it is designed for a television user experience.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M245: Application Uses USB Feature

AdminStudio 2019 | Application Manager

M245 scans the mobile app to determine if it uses USB features.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M246: Application Accesses the Calendar

AdminStudio 2019 | Application Manager

M246 scans the mobile app to determine if it accesses the calendar.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M247: Application Uses Device Admin

AdminStudio 2019 | Application Manager

M247 scans the mobile app to determine if it uses the device administration feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category

Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

Google Android <uses-feature>

M248: Application Uses Heart Rate Sensor

AdminStudio 2019 | Application Manager

M248 scans the mobile app to determine if it uses the heart rate sensor feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category

Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also

Google Android <uses-feature>
M249: Application Uses Relative Humidity Sensor

The Android Mobile Risk Assessment tests are included in AdminStudio Professional Edition Mobile and AdminStudio Enterprise Edition Mobile.

M249 scans the mobile app to determine if it uses the relative humidity sensor feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M250: Application Uses Internet Access

The Android Mobile Risk Assessment tests are included in AdminStudio Professional Edition Mobile and AdminStudio Enterprise Edition Mobile.

M250 scans the mobile app to determine if it uses Internet access.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M251: Application Accesses Bookmarks

AdminStudio 2019 | Application Manager

M251 scans the mobile app to determine if it accesses bookmarks.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M252: Application Uses External Storage

AdminStudio 2019 | Application Manager

M252 scans the mobile app to determine if it uses external storage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M253: Uses Account Manager

AdminStudio 2019 | Application Manager

M253 scans the mobile app to determine if it uses the Account Manager feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M254: Application Uses Kill Background Processes

AdminStudio 2019 | Application Manager

M254 scans the mobile app to determine if it uses “kill background” processes.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M255: Application Uses Profile

AdminStudio 2019 | Application Manager

M255 scans the mobile app to determine if it uses the profile feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category

Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also

Google Android <uses-feature>

M256: Application Uses Manage Documents

AdminStudio 2019 | Application Manager

M256 scans the mobile app to determine if it uses the manage documents feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category

Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

M257: Application Uses IRTransmitter

AdminStudio 2019 | Application Manager

M257 scans the mobile app to determine if it uses the IRTransmitter feature.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M258: Application Uses Body Sensors

AdminStudio 2019 | Application Manager

M258 scans the mobile app to determine if it uses body sensors.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M259: Application Accesses Voice Mail

AdminStudio 2019 | Application Manager

M259 scans the mobile app to determine if it accesses voice mail.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M260: Android Pay

AdminStudio 2019 | Application Manager

M260 scans the mobile app to determine if it uses Android Pay.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M261: Fingerprint Scanner

AdminStudio 2019 | Application Manager

M261 scans the mobile app to determine if it uses the fingerprint scanner.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>

M262: Direct Share

AdminStudio 2019 | Application Manager

M262 scans the mobile app to determine if it implements Direct Share, which enables someone to share something from just about any app on the mobile phone directly to one of their frequent contacts.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Google Android <uses-feature>
M263: VR Mode

AdminStudio 2019 | Application Manager

M263 scans the mobile app to determine if it uses VR (virtual reality) mode.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Android Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

Apple Mobile Risk Assessment Tests

AdminStudio 2019 | Application Manager

The following Apple mobile risk assessment tests are described in this section:

- M101: Application Requires Telephony
- M102: Application Requires Wi-Fi
- M103: Application Requires SMS Scheme
- M104: Application Uses a Camera
- M105: Application Uses an Auto-Focus Camera
- M106: Application Uses a Front-Facing Camera
- M107: Application Uses a Camera Flash
- M108: Application Uses a Video Camera
- M109: Application Uses an Accelerometer
- M110: Application Uses a Gyroscope
- M111: Application Uses Location Services
- M112: Application Uses GPS
- M113: Application Uses a Magnetometer
• M114: Application Uses Gamekit
• M115: Application Uses the Microphone
• M116: Application Uses OpenGL ES 1.1
• M117: Application Uses OpenGL ES 2.0
• M118: Application Uses ARMv6
• M119: Application Uses ARMv7
• M120: Application Uses Peer-to-Peer via Bluetooth
• M121: Application Uses Bluetooth LE
• M122: Application Uses Safari
• M123: Application Runs Only on an iPad
• M124: Application Uses Persistent Wi-Fi
• M125: Application Runs Only on an iPhone or iPod
• M126: Application Can Share Files Through iTunes
• M127: Application Can Interface Enumerated External Devices
• M128: Application Can Open a Specific File Type
• M129: Application Can Save a Specific File Type
• M130: Application Can Copy/Paste a Specific File Type
• M131: Application Supports Location Tracking
• M132: Application Supports Ad Networks
• M133: Application Accesses the Address Book
• M134: Application Supports In-App Purchases
• M135: Application Supports Social Networking
• M136: Application Supports User Identity
• M137: Application Accesses Local Pictures
• M138: Application Accesses the Calendar
• M139: Application Uses OpenGL ES 3.0
• M140: Application Accesses HealthKit
• M141: Application Uses Metal
• M142: Application Uses Local Authentication (Touch ID)
• M143: Application Uses HomeKit
• M144: Application Uses CloudKit
• M145: Application Uses Barometer
• M146: Application Uses PassKit (ApplePay)
M101: Application Requires Telephony

AdminStudio 2019 | Application Manager

M101 scans the mobile app for the presence of telephony usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M102: Application Requires Wi-Fi

AdminStudio 2019 | Application Manager

M102 scans the mobile app for the presence of wireless networking usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M103: Application Requires SMS Scheme

AdminStudio 2019 | Application Manager

M103 scans the mobile app for the presence of SMS scheme usage.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M104: Application Uses a Camera

AdminStudio 2019 | Application Manager

M104 scans the mobile app to determine if it uses the device camera.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M105: Application Uses an Auto-Focus Camera

AdminStudio 2019 | Application Manager

M105 scans the mobile app to determine if it uses the auto-focus camera.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M106: Application Uses a Front-Facing Camera**

AdminStudio 2019 | Application Manager

M106 scans the mobile app to determine if it uses a front-facing camera.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M107: Application Uses a Camera Flash**

AdminStudio 2019 | Application Manager

M107 scans the mobile app to determine if it uses the camera flash.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

Apple iOS Dev Center

M108: Application Uses a Video Camera
AdminStudio 2019 | Application Manager

M108 scans the mobile app to determine if it uses the video camera.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M109: Application Uses an Accelerometer
AdminStudio 2019 | Application Manager

M109 scans the mobile app to determine if it uses the device accelerometer.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M110: Application Uses a Gyroscope
AdminStudio 2019 | Application Manager

M110 scans the mobile app to determine if it uses the device gyroscope.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M111: Application Uses Location Services**

AdminStudio 2019 | Application Manager

M111 scans the mobile app to determine if it uses location services.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M112: Application Uses GPS**

AdminStudio 2019 | Application Manager

M112 scans the mobile app to determine if it uses GPS.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M113: Application Uses a Magnetometer

AdminStudio 2019 | Application Manager

M113 scans the mobile app to determine if it uses the device magnetometer.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M114: Application Uses Gamekit

AdminStudio 2019 | Application Manager

M114 scans the mobile app to determine if it uses the game center.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M115: Application Uses the Microphone

AdminStudio 2019 | Application Manager

M115 scans the mobile app to determine if it uses a microphone.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M116: Application Uses OpenGL ES 1.1**

AdminStudio 2019 | Application Manager

M116 scans the mobile app to determine if it uses accelerated 3D graphics (OpenGL ES 1.1).

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

**M117: Application Uses OpenGL ES 2.0**

AdminStudio 2019 | Application Manager

M117 scans the mobile app to determine if it uses accelerated 3D graphics (OpenGL ES 2.0).

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M118: Application Uses ARMv6

AdminStudio scans the mobile app to determine if it uses the ARMv6 instruction set. AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M119: Application Uses ARMv7

AdminStudio scans the mobile app to determine if it uses the ARMv7 instruction set. AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

See Also
Apple iOS Dev Center

M120: Application Uses Peer-to-Peer via Bluetooth

AdminStudio scans the mobile app to determine if it uses peer-to-peer connectivity via Bluetooth.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

### M121: Application Uses Bluetooth LE

M121 scans the mobile app to determine if it uses Bluetooth LE.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

**See Also**
Apple iOS Dev Center

### M122: Application Uses Safari

M122 scans the mobile app to determine if it uses the Safari web browser.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

**Test Group/Test Category**
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

**Severity**
- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

M123: Application Runs Only on an iPad

AdminStudio 2019 | Application Manager

M123 scans the mobile app to determine if it only can be installed on an iPad.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

Apple iOS Dev Center

M124: Application Uses Persistent Wi-Fi

AdminStudio 2019 | Application Manager

M124 scans the mobile app to determine if it uses persistent Wi-Fi.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity
• If the application requires the feature as part of the application’s primary functionality, an Error is generated.
• If the application calls the feature’s APIs, a Warning is generated.

M125: Application Runs Only on an iPhone or iPod

AdminStudio 2019 | Application Manager

M125 scans the mobile app to determine if it only can be installed on an iPhone/iPod.
AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

M126: Application Can Share Files Through iTunes

AdminStudio 2019 | Application Manager

M126 scans the mobile app to determine if it can share files through iTunes.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Best Practices/Mobile Risk Assessment/Apple Mobile Risk Assessment

Severity

- If the application requires the feature as part of the application’s primary functionality, an Error is generated.
- If the application calls the feature’s APIs, a Warning is generated.

Desktop Risk Assessment Tests

AdminStudio 2019 | Application Manager

The following categories of desktop risk assessment tests are described in this section:

• Mac OS Risk Assessment
• Windows Risk Assessment

Mac OS Risk Assessment

AdminStudio 2019 | Application Manager

The following Mac OS risk assessment tests are described in this section:

• D001: App Transport Security (ATS)
• D002: ATS Exemptions
• D003: Insecure HTTP Connections
• D004: Forward Secrecy Exemptions
• EOLMAC001: Java Versions Required
• EOLMAC002: Java Installer Versions
D001: App Transport Security (ATS)

AdminStudio 2019 | Application Manager

D001 scans the app to determine if App Transport Security (ATS) is disabled.

Starting in OS X v10.11, a new security feature called App Transport Security (ATS) is available to apps and is enabled by default. It improves the privacy and data integrity of connections between an app and web services by enforcing additional security requirements for HTTP-based networking requests. Specifically, with ATS enabled, HTTP connections must use HTTPS (RFC 2818). Attempts to connect using insecure HTTP fail. Furthermore, HTTPS requests must use best practices for secure communications.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Risk Assessment/Desktop Risk Assessment/macOS Risk Assessment

Severity

• If the application requires the feature as part of the application’s primary functionality, an Error is generated.

• If the application calls the feature’s APIs, a Warning is generated.

NSAppTransportSecurity
D003: Insecure HTTP Connections

AdminStudio 2019 | Application Manager

D003 scans the app to determine if the app allows insecure HTTP connections to any of the domains.

Starting in OS X v10.11, a new security feature called App Transport Security (ATS) is available to apps and is enabled by default. It improves the privacy and data integrity of connections between an app and web services by enforcing additional security requirements for HTTP-based networking requests. Specifically, with ATS enabled, HTTP connections must use HTTPS (RFC 2818). Attempts to connect using insecure HTTP fail. Furthermore, HTTPS requests must use best practices for secure communications.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Risk Assessment/Desktop Risk Assessment/macOS Risk Assessment

Severity

● If the application requires the feature as part of the application’s primary functionality, an Error is generated.

● If the application calls the feature’s APIs, a Warning is generated.

See Also
NSAppTransportSecurity

D004: Forward Secrecy Exemptions

AdminStudio 2019 | Application Manager

D004 scans the app to determine if Forward Secrecy is exempted for any of the domains.

The security of communications transmitted across the Internet can be improved by using public key cryptography. However, if the public and private keys used in those communicators are compromised, it can reveal the data exchanged in that session as well as the data exchanged in previous sessions.

The concept of Forward Secrecy (FS) is the property that ensures that a session key derived from a set of long-term public and private keys will not be compromised if one of the (long-term) private keys is compromised in the future.

AdminStudio examines the application’s metadata to determine if the feature is part of the application’s primary functionality, and whether it calls the feature’s APIs.

Test Group/Test Category
Risk Assessment/Desktop Risk Assessment/macOS Risk Assessment

Severity

● If the application requires the feature as part of the application’s primary functionality, an Error is generated.

● If the application calls the feature’s APIs, a Warning is generated.

EOLMAC001: Java Versions Required

EOLMAC001 scans the application to determine whether it has a dependency on a Java version (required for the package after installation) that has been designated as end of life/end of support. If the application does have such a dependency, an error is generated. Also, a warning is generated if the application depends on a version of Java (required for the package after installation) that is not the most recent version.

Test Group/Test Category
Risk Assessment/Desktop Risk Assessment/macOS Risk Assessment

Severity
- **Error**—Generated if application is dependent upon a Java version (required for the package after installation) that has been designated as end-of-life/end-of-support.
- **Warning**—Generated if application depends upon a version of Java (required for the package after installation) that is not the most recent version.

Rule Background
An application which requires an EOL Java version needs to be handled before deploying, for instance, by updating the application to its higher/latest version. The application is tested to check if it requires a Java version which is EOL.

*Note* • Java dependency information is extracted during package import of Windows and macOS desktop applications, and can be viewed by opening the **ASCMPackageJavaSummary** table in the **Tables View**.

Oracle Java SE Support Roadmap

EOLMAC002: Java Installer Versions

EOLMAC002 scans the application to determine whether it has a dependency on a Java version (required during package installation) that has been designated as end of life/end of support. If the application does have such a dependency, an error is generated. Also, a warning is generated if the application depends on a version of Java (required during package installation) that is not the most recent version.

Test Group/Test Category
Risk Assessment/Desktop Risk Assessment/macOS Risk Assessment

Severity
- **Error**—Generated if application is dependent upon a Java version (required during package installation) that has been designated as end-of-life/end-of-support.
- **Warning**—Generated if application depends upon a version of Java (required during package installation) that is not the most recent version.
Rule Background

An application which installs an EOL Java version is risky. The application is tested to check if it installs a Java version which is EOL.

Note • Java dependency information is extracted during package import of Windows and macOS desktop applications, and can be viewed by opening the ASCMPackageJavaSummary table in the Tables View.

Warning

Message
The destination [PATH1] for the component [COMPONENT1] in the package [PACKAGE1] conflicts with the destination for the component [COMPONENT1] in the package [PACKAGE2]. The correct destination should be [PATH2].

Background
If components with the same ComponentId have different destination paths, ACE02 fails.

Resolution

Automatic Fix (CARD02)
CARD02 automatically sets the destination path of the component in the source package to match that of the component in the target package. To do this, CARD02 runs the following query and replaces the Directory_ column with a run-time translation of the target's component (csFullPath) path:

MsiDBUtils::GetDirectoryTargetPathKey.
SELECT `Directory_` FROM `Component`
WHERE ComponentId='Source ComponentId'

ACE03: New or Missing Files in Identical Components

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE03 checks whether components in different packages that have matching ComponentId values also contain the same files.

Test Group/Test Category
Application Conflicts/Package Data Conflicts/Files

Severity
Warning
Chapter 16  Analyze Tests
Application Conflicts Tests

Message
The file(s) [FILENAME] in the component [COMPONENT1] in the package [PACKAGE1] are either new to or missing from the component [COMPONENT1] in the package [PACKAGE2].

Background
If components with the same ComponentId do not contain the same files (either files are missing or they are different versions), ACE03 fails.

Resolution

Manual Fix
Use InstallShield Editor to create a Windows Installer Transform (.mst) file for the source package MSI so that the component in the source package contains the same files as the component in the target package.

Task To resolve this issue:

1. Open the MSI package in InstallShield Editor.
2. Add or modify the components as necessary so that the file(s) is present in both components and the versions match in both MSI packages. To accomplish this:
   a. In the View List under Organization, click Components.
   b. In the Components explorer, find the component that needs to be modified, expand the list under the component, and select Files. A list of the files included with that component is displayed.
   c. To delete a file that is not present in the other component, right-click the file and then click Delete.
      To add a new file to match the other component, right-click anywhere in the Files list, click Add, and add the correct file.
3. On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.
4. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE03 again.

ACE07: Same File in Different Components

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE07 checks for the existence of the same file in components with different ComponentIds.

Test Group/Test Category
Application Conflicts/Package Data Conflicts/Files
Severity and Messages

ACE07 reports four types of errors, depending on the various combinations of source and target files and whether or not they originated in a merge module:

Table 16-6 • Four Types of ACE07 Errors

<table>
<thead>
<tr>
<th>Source File</th>
<th>Target File</th>
<th>Severity</th>
<th>CARD-Enabled</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Merge Module</td>
<td>Merge Module</td>
<td>Warning</td>
<td>No</td>
<td>The file [FILENAME] in the component [COMPONENTNAME] in the package [PACKAGENAME] is identical to the merge module installed file in the component [COMPONENTNAME] in the package [PACKAGENAME]. Confirm this error by running this package against ACE12.</td>
</tr>
<tr>
<td>Not Merge Module</td>
<td>Not Merge Module</td>
<td>Error</td>
<td>Yes</td>
<td>The file [FILENAME] is identical in both the component [COMPONENTNAME] in the package [PACKAGENAME] and the component [COMPONENTNAME] in the package [PACKAGENAME], but the components have different GUIDs.</td>
</tr>
<tr>
<td>Merge Module</td>
<td>Merge Module</td>
<td>Error</td>
<td>No</td>
<td>The file [FILENAME] is identical and installed by merge modules in both the component [COMPONENTNAME] in the package [PACKAGENAME] and the component [COMPONENTNAME] in the package [PACKAGENAME], but the components have different GUIDs. Run ACE12 to determine which merge module is most appropriate to use.</td>
</tr>
<tr>
<td>Merge Module</td>
<td>Not Merge Module</td>
<td>Error</td>
<td>No</td>
<td>The file [FILE_NAME] in the merge module installed component [COMPONENT_NAME] in the package [PACKAGE_NAME] is identical to the file in the component [COMPONENT_NAME] in the package [PACKAGE_NAME]. Confirm this error by running the [PACKAGE_NAME] package against the ACE12.</td>
</tr>
</tbody>
</table>

Background

ACE07 reports four types of errors, depending on the various combinations of source and target files and whether or not they originated in a merge module.

Resolutions

Manual Fix

If both the source and target files did not originate in a Merge Module, confirm the error by running the package against ACE12 and then, based upon the results, decide how to proceed.

Automatic Fix (CARD07)

If both the source and target files originated in a Merge Module, you can use CARD07 to resolve the issue. CARD07 changes the ComponentId value of the source package to match that of the target package. To do this, CARD07 runs the following query against the source package and then updates the ComponentId value with the ComponentId value from the target package:
SELECT `ComponentId` FROM `Component` WHERE `Component` = 'Source Package ComponentId'

ACE08: Identical Components with Different Versions of a File

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE08 identifies components with identical ComponentIds, and checks those components to see if the versions of the files in each component match.

Test Group/Test Category
Application Conflicts/Package Data Conflicts/Files

Severity
Warning

Message

Background
If components with identical ComponentIds contain different versions of a file, ACE08 fails.

Resolution

Manual Fix
Change the file versions to match those of the Target component, or change the file versions in the Source component.

Task To resolve this issue:

1. Open the MSI package in InstallShield Editor.
2. Once the project is open, there are two options that can be used to resolve the issue:
   
   Option #1: Change the Component Code. To accomplish this:
   
   a. In the View List under Organization, click Components.
   
   b. In the Components explorer, click the component that needs to be modified.
   
   c. In the Component Code, enter the appropriate value.
**Option #2: Replace the files so that the versions match in both MSI packages.** To accomplish this:

a. In the View List under **Organization**, click **Components**.

b. In the **Components** explorer, find the component that needs to be modified, expand the listing under the component, and select **Files**. The list of files included with that component is displayed.

c. To delete a file with the wrong version, right-click the file, and then click **Delete**.

   To add the correct version of a file, right-click anywhere in the **Files** list, click **Add**, and add the new file with the correct version.

3. On the **File** menu, click **Save As**, and save the changes as a Windows Installer Transform (.mst) file.

4. Open **Application Catalog** and reimport this package with its transform file into your **Application Catalog**, and then use the **Conflict Wizard** to check it against ACE08 again.

---

**ACE09: Identical Merge Modules**

**AdminStudio 2019 | Application Manager**

---

*Edition • This test is included in the AdminStudio Professional and Enterprise Editions.*

ACE09 checks whether merge modules with identical ComponentId values are identical.

**Test Group/Test Category**

Application Conflicts/Package Data Conflicts/Components

**Severity**

Warning

**Message**

The merge module, [MERGE_MODULE_NAME], version [VERSION_NUMBER1], conflicts with the same merge module, version [VERSION_NUMBER2], in another package.

**Background**

If merge modules with identical ComponentIds are different, a warning is generated.

**Resolution**

**Manual Fix**

Obtain the latest version of the merge module and rebuild the MSI.
Chapter 16  Analyze Tests
Application Conflicts Tests

To resolve this issue:

1. Obtain the latest version of the merge module that is displayed in the ACE message. The merge module may be available for download at the vendor’s web site.

2. Open the MSI package in InstallShield Editor.

3. Place the new merge module in one of the Merge Module Locations that are specified on the Merge Modules tab of the Application Catalog Options dialog box. This allows the merge module to be displayed in the Redistributables view of the InstallShield Editor.

4. In the View List under Application Data, click Redistributables.

5. Clear the check box of the old merge module that is causing the conflict, and select the check mark of the new merge module in its place.

6. On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.

7. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE09 again.

ACE10: Conflicts in Registry Root, Key, and Name Combinations

AdminStudio 2019 | Application Manager

This test is included in the AdminStudio Professional and Enterprise Editions.

ACE10 checks for the existence of identical root/key/name registry combinations in components with different ComponentId values.

Test Group/Test Category
Application Conflicts/Package Data Conflicts/Registry

Severity
Warning

Message
The registry entry [REGISTRY_ENTRY] [REGISTRY_KEY] in the component [COMPONENT1] in the package [PACKAGE1] conflicts with the same registry entry in the component [COMPONENT1] in the package [PACKAGE2].

Background
If the same root/key/name registry combination is in more than one component, a warning is generated.
Conditions When an ACE10 Error Can Be Ignored

ACE10 uses data from the Registry table in the .msi package to check for identical registry root/key/name combinations in different components. However, there may be situations in which ACE10 reports an error unnecessarily. Windows Installer supports a grammar for the Registry table in which every time that the value in the Value field is preceded or terminated by the sequence tilde ‘[-]’, the registry value is appended or prefixed, respectively, to the existing registry value. This sort of operation may be perfectly acceptable if the applications in question are modifying a common registry key in a manner consistent with its purpose.

Decide individually if an ACE10 error is valid, but consider checking the Registry Value field, since its contents may prove useful in helping you decide.

Resolution

Manual Fix

ACE12: Files from Merge Modules

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE12 checks for components that contain files that can be replaced by one of the merge modules that you have imported into the Application Catalog database. (Before running ACE12, you should import all merge modules that you are likely to use at your organization into the Application Catalog database.)
**Test Group/Test Category**
Application Conflicts/Package Data Conflicts/Files

**Severity and Messages**
ACE12 reports an error if the file in question originated from a merge module and the merge module was found in the Application Catalog. If the merge module was not found in the Application Catalog, ACE12 reports a warning:

**Table 16-7 • ACE12 Output Summary**

<table>
<thead>
<tr>
<th>Package File</th>
<th>Severity</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not from Merge Module</td>
<td>Error</td>
<td>The file [FILENAME] in the component [COMPONENT1] in the package [PACKAGE1] should be replaced with the merge module [MERGE_MODULE_NAME].</td>
</tr>
<tr>
<td>From Merge Module</td>
<td>Warning</td>
<td>The [FILENAME] file originating from the [ModuleID] Merge Module in package [PACKAGE1] is a candidate to be replaced with the [MERGE_MODULE_NAME]. However, the [ModuleID] Merge Module is not in the Application Catalog which makes proper evaluation impossible.</td>
</tr>
</tbody>
</table>

**Background**
ACE12 reports a warning if the file in question originated from a merge module and the merge module was found in the Application Catalog. If the merge module was not found in the Application Catalog, ACE12 reports an error.

Using merge modules is always preferable as a way to install files in a consistent fashion.

**Resolution**

Manual Fix

---

**Task**

**To resolve this issue:**

1. Open the MSI package in InstallShield Editor.
2. In the View List under Organization, click Setup Design.
3. In the Setup Design explorer, find the component that is listed in the message, expand the list under the component, and select Files. A list of the files included with that component is displayed.
4. Right-click the file that was displayed in the error message, and then click Delete.
5. Take note of the feature that contains the component.
6. In the View List under Application Data, click Redistributables.
7. Select the check box of the appropriate merge module.
8. In the Conditional Installation pane, select check box of the feature that contains the component.
9. Rebuild the package.
10. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE12 again.

ACE13: Shortcut Conflicts

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE13 checks for the existence of the same shortcut within different packages in components with different ComponentIds.

Test Group/Test Category

Application Conflicts/Package Data Conflicts/Shortcuts

Severity

Warning

Message

The shortcut [SHORTCUT_NAME] in the component [COMPONENT1] in the package [PACKAGE1] conflicts with the same shortcut in the component [COMPONENT2] in the package [PACKAGE2].

Background

If the same shortcut exists in more than one component, ACE13 fails.

Resolution

Manual Fix

Task To resolve this issue:

1. Open the MSI package in InstallShield Editor.
2. In the View List under Organization, click Components.
3. In the Components explorer, find the component that is listed in the message.
4. In the Component Code setting, change the value to match the component code (ComponentId) of the component in the other project.

If it is unclear what value you should use, do the following:

a. In InstallShield Editor, open the package that will not be edited.

b. In the View List under Additional Tools, click Direct Editor.

c. In the Tables explorer, click the Component table.
d. Search for the component name that is included in the message, and note the value that is listed in the \ComponentId\ column for that component. This is the component code that you should use for the component in the other package.

5. On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.

6. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE13 again.

ACE14: Duplicate INI File in Different Components

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE14 checks for the existence of components with different ComponentIds that modify the same INI file entry, such as the [File Name/Section/Key/Value] entry.

Test Group/Test Category
Application Conflicts/Package Data ConflictsINI Files

Severity
Warning

Message
The INI file entry [INI_FILE_ENTRY] in the file [INI_FILE_NAME] in the component [COMPONENT1] in the package [PACKAGE1] conflicts with the same INI file entry in the component [COMPONENT1] in the package [PACKAGE2].

Background
If the same INI file entry is modified by different components, ACE14 fails.

Resolution
Manual Fix
To resolve ACE14, change the ComponentId of the Source component to match the ComponentId of the Target component.

Task To resolve this conflict:
1. Open the MSI package in InstallShield Editor.
2. In the View List under Organization, click Components.
3. In the Components explorer, find the component that is listed in the message.
4. In the **Component Code** setting, change the value to match the component code (ComponentId) of the component in the other project.

If it is unclear what value you should use, do the following:

a. In InstallShield Editor, open the package that will not be edited.

b. In the View List under **Additional Tools**, click **Direct Editor**.

c. In the **Tables** explorer, click the **Component** table.

d. Search for the component name that is included in the message, and note the value that is listed in the **ComponentId** column for that component. This is the component code that you should use for the component in the other package.

5. On the **File** menu, click **Save As**, and save the changes as a Windows Installer Transform (.mst) file.

6. Open **Application Catalog** and reimport this package with its transform file into your **Application Catalog**, and then use the **Conflict Wizard** to check it against ACE14 again.

---

**ACE15: Duplicate ODBC Entries in Different Components**

AdminStudio 2019 | Application Manager

---

*Edition • This test is included in the AdminStudio Professional and Enterprise Editions.*

ACE15 checks for the existence of identical ODBC entries in components with different ComponentId values.

### Test Group/Test Category

Application Conflicts/Package Data Conflicts/ODBC Resources

### Severity

Error

### Message

### Background

If identical ODBC entries exist in components with different ComponentId values, ACE15 fails.

### Resolution

#### Automatic Fix (CARD15)

CARD15 changes the ComponentId value of the source package to match that of the target package. To do this, CARD15 runs the following query against the source package and then updates the ComponentId value with the ComponentId value from the target package:
ACE16: Duplicate Services in Different Components

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE16 checks for the existence of identical Windows services in components with different ComponentIds.

**Test Group/Test Category**

Application Conflicts/Package Data Conflicts/NT Services

**Severity**

Warning

**Message**

The NT service [SERVICE1] in the component [COMPONENT1] in the package [PACKAGE1] conflicts with the same NT Service in the component [COMPONENT1] in the package [PACKAGE2].

**Background**

If identical services are present within different components, ACE16 fails.

**Resolution**

**Manual Fix**

Change the ComponentId of the Source component to match the ComponentId of the Target component.

**ACE21: Conflicts Between Entries in the IniFile and File Tables**

ACE21 checks entries in the IniFile table to see if they conflict with similar entries in the File table. The IniFile and File tables can change the same physical file. As a result, this ACE identifies these duplicate file changes so that they can be evaluated.

**Test Group/Test Category**
Application Conflicts/Package Data Conflicts/INI Files

**Severity**
Warning
**Message**

The INI file [INI_FILENAME] installed using the IniFile table to the destination [PATH_NAME] in the package [PACKAGE1.MSI] conflicts with the same file in the File table in the package [PACKAGE2].

**Background**

If an entry in the IniFile table of the first MSI package duplicates a file name in a component of the File table of the second MSI package, and both are set to be installed to the same destination, ACE21 fails.

**Resolution**

**Manual Fix**

To resolve ACE21, ensure that identically named INI files with identical destinations are identical in both the File and IniFile tables. This may involve adding or deleting sections or changing values in the INI files.

<table>
<thead>
<tr>
<th>Task</th>
<th>To resolve this issue:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>In InstallShield Editor, open a transform file or MSI package that has an entry in the IniFile table.</td>
</tr>
<tr>
<td>2.</td>
<td>In the View List under System Configuration, click Ini Files Changes.</td>
</tr>
<tr>
<td>3.</td>
<td>In the Ini Files explorer, find the INI file entry that is listed in the message.</td>
</tr>
<tr>
<td>4.</td>
<td>Analyze the sections, keywords, and values in this INI file and compare them to the INI file in the other MSI package. Edit the sections, keywords, and values in this INI file so that they match those of the second INI file. This may require adding and/or deleting data in the Ini File Changes view.</td>
</tr>
<tr>
<td>5.</td>
<td>On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.</td>

**ACE22: IniFile and File Table Entries for the Same File**

AdminStudio 2019 | Application Manager

**Edition** • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE22 checks file name/target directory pairs in the File table to see if they conflict with similar entries in the IniFile table. The IniFile and File tables can change the same physical file. As a result, this ACE identifies these duplicate file changes so that they can be evaluated.

**Test Group/Test Category**

Application Conflicts/Package Data Conflicts/INI Files
Chapter 16  Analyze Tests
Application Conflicts Tests

Severity
Warning

Message
The INI file [INI_FILENAME] installed using the File table to the destination [PATH_NAME] in the package [PACKAGE3.MSI] conflicts with the same file in the IniFile table in the package [PACKAGE4].

Background
If a file name/target directory pair in a component in the File table is also listed as an IniFile table entry, ACE22 fails.

Resolution

Manual Fix
To resolve ACE22, ensure that identically named INI files with identical destinations are identical in both the File and IniFile tables. This may involve adding or deleting sections or changing values in the INI files.

Task

To resolve this issue:

1. In InstallShield Editor, open a transform file or MSI package that has an entry in the IniFile table.
2. In the View List under System Configuration, click INI Files Changes.
3. In the INI Files explorer, find the INI file entry that is listed in the message.
4. Analyze the sections, keywords, and values in this INI file and compare them to the INI file in the other MSI package. Edit the sections, keywords, and values in this INI file so that they match those of the second INI file. This may require adding and/or deleting data in the INI File Changes view.
   To retrieve the INI file from the other MSI package, you may need to extract it from the MSI file itself or a cabinet file if the files are compressed on the source media.
5. On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.
6. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE22 again.

ACE23: Duplicate Files with Different Sizes, Versions, or Languages

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

ACE23 identifies file duplication between source and target packages. ACE23 checks whether files with the same name and destination directory have the same size, version, and language when comparing a source package against a target package. If a file with the same name and destination directory is found in both the source and target packages, but the file has a different size, version, or language, ACE23 fails.
**Test Group/Test Category**

Application Conflicts/Package Data Conflicts/Files

**Severity**

Warning

**Message**

**Background**

If a file with the same name and destination directory is found in both the source and target package (and, in the case of an MSI package comparison, the packages have different ComponentId values), but the file has a different size, version, or language, ACE23 fails. If the source and target packages are MSI packages and they have the same ComponentId value, no error is reported.

**Resolution**

This issue requires a manual resolution. Investigate the issue and decide which file has precedence. If the source file has precedence over the target file, remove the target file. Use one of the following solutions.

**Manual Fix: Solution 1**

This fix involves replacing the file in the source package with the same file that is in the target package.

<table>
<thead>
<tr>
<th>Task</th>
<th>To replace the file in the source package with the same file that is in the target package:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Retrieve a copy of the file from the operating system in which the target package was taken.</td>
</tr>
<tr>
<td></td>
<td>2. Open a transform file or MSI package in InstallShield Editor.</td>
</tr>
<tr>
<td></td>
<td>3. In the View List under Application Data, click Files and Folders.</td>
</tr>
<tr>
<td></td>
<td>4. Find the file that is listed in the message, and replace it with the one that you retrieved from the operating system.</td>
</tr>
<tr>
<td></td>
<td>5. On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.</td>
</tr>
<tr>
<td></td>
<td>6. Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE23 again.</td>
</tr>
</tbody>
</table>

**Manual Fix Solution 2**

This fix involves changing the destination of the component that contains the file in the target package.

<table>
<thead>
<tr>
<th>Task</th>
<th>To change the destination of the component that contains the file in the target package:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1. Open a transform file or MSI package in InstallShield Editor.</td>
</tr>
<tr>
<td></td>
<td>2. In the View List under Organization, click Components.</td>
</tr>
</tbody>
</table>
3. In the **Components** explorer, find the component that is listed in the message.

4. In the **Component Code** setting, change the value to match the component code (ComponentId) of the component in the other project.

   To quickly find the component name, open the File table in the Direct Editor view and search for the file name. Then, check the **Component** column for the component name.

5. In the **Destination** setting, change the value to a new destination.

   Changing the destination may cause the application to break. Before changing the destination, verify that the application will still work with the new destination.

6. On the **File** menu, click **Save As**, and save the changes as a Windows Installer Transform (.mst) file.

7. Open **Application Catalog** and reimport this package with its transform file into your **Application Catalog**, and then use the **Conflict Wizard** to check it against ACE23 again.

---

**ACE24: Duplicate Registry Entries with Different Data Types or Values**

AdminStudio 2019 | Application Manager

---

**Edition** • *This test is included in the AdminStudio Professional and Enterprise Editions.*

ACE 24 checks whether registry entries with the same registry hive, key, and value name have the same data type and value. If a registry entry with the same registry hive, key, and value name in a package is found in both the source and target packages, but the registry entry has a different data type or value, ACE24 fails.

**Test Group/Test Category**

Application Conflicts/Package Data Conflicts/Registry

**Severity**

Warning

**Message**

The registry entry [REGISTRY_ENTRY] in [PACKAGE1] conflicts with the same registry entry in the [COMPONENT] in [PACKAGE2].

**Background**

If a registry entry with the same registry hive, key, and value name in a package is found in both the source and target packages, but the registry entry has a different data type or value, ACE24 fails.
Resolution

Manual Fix

<table>
<thead>
<tr>
<th>Task</th>
<th>To resolve this issue:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open a transform file or MSI package in InstallShield Editor.</td>
</tr>
<tr>
<td>2.</td>
<td>In the View List under System Configuration, click Registry.</td>
</tr>
<tr>
<td>3.</td>
<td>Find the registry value that is listed in the message, and replace that value with the same registry value and data type that are in the target package.</td>
</tr>
<tr>
<td>4.</td>
<td>On the File menu, click Save As, and save the changes as a Windows Installer Transform (.mst) file.</td>
</tr>
<tr>
<td>5.</td>
<td>Open Application Catalog and reimport this package with its transform file into your Application Catalog, and then use the Conflict Wizard to check it against ACE24 again.</td>
</tr>
</tbody>
</table>

ACE30: Different Components that Install the Same Key File

AdminStudio 2019 | Application Manager

Edition • This test is included in the AdminStudio Professional and Enterprise Editions.

The ACE30 is a check for key path conflicts across components. It identifies components that have different ComponentId values but that install the same key file to the same directory.

Test Group/Test Category
Application Conflicts/Package Data Conflicts/Components

Severity
Warning

Message
The [SOURCE_COMPONENT_NAME] component in [SOURCE_PRODUCT_NAME] is installing the [SOURCE_PATH_NAME]\[SOURCE_KEYPATH_FILE] file which is also being installed by [TARGET_PRODUCT_NAME] with a different ComponentId.

Background
ACE30 checks to determine if different components are installing identically named key files to the same directory.

The ACE executes the following query to check to see if the same key file is being installed with different ComponentId values:

Source.ComponentId <> Target.ComponentId AND Source.csFullPath = Target.csFullPath AND Source.KeyPath = Target.KeyPath
If the source and target products are installed in a particular order, one of the products may not work as expected. For example, if the files have the same name and location but one of them is an earlier version, if the product that contains the earlier version is installed after the product that installs the latest version, the product that requires the latest version of the file may not work. It is also possible that uninstalling one of the products may make the other product stop functioning.

If you encounter an ACE30 failure, test the installation and uninstallation of the source and target products, and ensure that both behave as expected in all expected scenarios.

Microsoft App-V Conflict Tests

The following are the Microsoft App-V conflict tests:

- ACE200: Shortcut Location Conflicts
- ACE204: App-V Package ID Conflicts
- ACE205: Package Name Conflicts
- ACE206: File Extension and ProgID Conflicts
- ACE207: App-V Conflicts in Root Folder Names
- ACE215: App-V Shortcut Name and Version Conflicts

ACE200: Shortcut Location Conflicts

ACE200 checks whether two or more packages contain a shortcut with the same display name and location. It can be run against an App-V source package and against either an App-V or MSI target package. ACE200 identifies the shortcut name and location for the source package, then compares it to the target package’s name and location.

Test Group/Test Category
Application Conflicts/Microsoft App-V Conflict Tests

Severity
Error

Message
Shortcut [SHORTCUT_NAME] in package [PACKAGE_NAME] has a target that conflicts with shortcut [SHORTCUT_NAME] in package [PACKAGE_NAME]

Background
If two or more packages contain a shortcut with the same display name and location, an error is generated.

Resolution
To resolve this issue, use the Virtual Package Editor.
Manual Fix

Task  To resolve this issue:

1. Open the App-V package in the Virtual Package Editor.
2. Open the **Shortcuts** view, and do one of the following:
   - Select the shortcut, and then modify the value in the **Display Name** setting or the **Location** setting.
   - Remove the shortcut from the App-V package.

ACE204: App-V Package ID Conflicts

ACE204 checks whether two or more packages have the same package GUID. If two packages have the same package GUID, they cannot be deployed simultaneously as separate packages. ACE204 can be run against an App-V source package and against only an App-V target package.

Test Group/Test Category
Application Conflicts/Microsoft App-V Conflict Tests

Severity
Error

Message
Package [PACKAGE_NAME] has a Package GUID that conflicts with package [PACKAGE_NAME]

Background
If two or more packages have the same package GUID, an error is generated.

Resolution

Manual Fix
If you are creating an upgrade package that can update earlier versions of the virtual package, the package GUID should stay the same.

If you are creating a new package that can be deployed simultaneously as another package, the package GUID in one of the packages must be changed. To change the package GUID, open the App-V package in the Virtual Package Editor and save the package as a new package.
ACE205: Package Name Conflicts

ACE205 checks whether two or more packages have the same name. This is not advisable from a best practice perspective, and it may cause some issues if you try to simultaneously deploy the App-V packages. ACE205 can be run against an App-V source package and against either an App-V or MSI target package.

Test Group/Test Category
Application Conflicts/Microsoft App-V Conflict Tests

Severity
Error

Message
Package [PACKAGE_NAME] has a name conflict with package [PACKAGE_NAME].

Background
If two or more packages have the same name, an error is generated.

Resolution
To resolve this ACE in an App-V package, use the Virtual Package Editor.

Manual Fix

<table>
<thead>
<tr>
<th>Task</th>
<th>To resolve this issue:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Open the App-V package in the Virtual Package Editor.</td>
</tr>
<tr>
<td>2.</td>
<td>In the View List under Package Information, click General Information.</td>
</tr>
<tr>
<td>3.</td>
<td>In the Name setting, replace the duplicate name with a unique name.</td>
</tr>
</tbody>
</table>

ACE206: File Extension and ProgID Conflicts

ACE206 checks whether two or more packages have support for the same file extension or ProgId. A file extension can be registered with only one application at a time. ACE206 can be run against an App-V source package and against either an App-V or MSI target package.

Test Group/Test Category
Application Conflicts/Microsoft App-V Conflict Tests

Severity
Error
**Message**

Package [PACKAGE_NAME] has a conflicting file extension [FILE_EXTENSION] or progid [PROGID] with package [PACKAGE_NAME].

**Background**

If two or more packages have support for the same file extension or ProgID, an error is generated.

**Resolution**

**Manual Fix**

To resolve ACE206, you may need to decide which package should contain the file extension association and which should not. Then you can use the Virtual Package Editor to remove the appropriate file extension.

---

**ACE207: App-V Conflicts in Root Folder Names**

ACE207 checks whether two or more packages have the same long or short name for the root folder. These names must be unique because two packages with the same root folder name cannot be deployed simultaneously. ACE207 can be run against an App-V source package and against only an App-V target package.

**Test Group/Test Category**

Application Conflicts/Microsoft App-V Conflict Tests

**Severity**

Error

**Message**

Package [PACKAGE_NAME] has a conflicting root Directory [DIRECTORY_NAME] with package [PACKAGE_NAME].

**Background**

If two or more packages have the same long or short name for the root folder, an error is generated.

**Resolution**

**Manual Fix**

To resolve this issue:

1. Open the App-V package in the Virtual Package Editor.
2. In the View List under Package Information, click General Information.
3. In the Root Folder Name setting, replace the duplicate folder name with a unique folder name.
Note • Instances of the old package’s root folder name may still exist in location-related configuration data, such as in registry entries, .ini files, or XML files in the App-V package. The root folder name is not updated in those areas automatically if you change the root folder name in the General Information view.

Therefore, if you know that the old package contains configuration data, you may need to identify where it is. Then you can use the Virtual Package Editor to update the root folder name as necessary. For example, you may want to use the Virtual Package Editor to extract a configuration file from the package. Next, you can update the root folder name in the file. In the Virtual Package Editor, you would then delete the old file from the App-V package, and add the updated file.

ACE215: App-V Shortcut Name and Version Conflicts

ACE215 indicates that an App-V package contains a shortcut (App-V application) that uses the same name and version as one in another package. The combination of the name and version should be unique for shortcuts in different packages, since only one application is published and available at any given time. ACE215 can be run against an App-V source package and against only an App-V target package.

Test Group/Test Category
Application Conflicts/Microsoft App-V Conflict Tests

Severity
Error

Message
Shortcut [SHORTCUT_NAME] in package [PACKAGE_NAME] has a name and version that conflicts with shortcut [SHORTCUT_NAME] in package [PACKAGE_NAME].

Background
If an App-V package contains a shortcut (App-V application) that uses the same name and version as one in another package, an error is generated.

Resolution

Manual Fix

Task | To resolve this issue:
--- | ---
1. | Open the App-V package in the Virtual Package Editor.
2. | In the View List under Application Data, click Shortcuts.
3. | Do one of the following:
   - Edit the shortcut: Select the target that contains the shortcut, and then modify the value in the Name setting or the Target Version setting.
Remote Application Publishing Compatibility Tests

AdminStudio 2019 | Application Manager

Edition • The Remote Desktop Services tests are included in the AdminStudio Professional and Enterprise Editions.

The Remote Application Publishing Compatibility category of tests includes tests that check Windows Installer packages for compatibility to be run via Windows Remote Desktop. These tests are grouped in the Remote Desktop Services Tests category.

The following subcategories of Remote Application Publishing Compatibility tests are available:

- Azure Application Services Tests
- Remote Desktop Services Tests

Azure Application Services Tests

AdminStudio 2019 | Application Manager

Edition • The Remote Desktop Services tests are included in the AdminStudio Professional and Enterprise Editions.

The following Azure Application Services tests are described in this section:

- MAS0001: Port Bindings
- MAS0002: Authentication
- MAS0003: Global Assembly Cache (GAC)
- MAS0004: IIS5 Compatibility Mode
- MAS0005: Application Pools
- MAS0006: COM and COM+ Components
- MAS0007: ISAPI Filters
- MAS0008: Migration of Other Components Like SSL, FTP

MAS0001: Port Bindings

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.
Azure Websites only support Port 80 for HTTP and Port 443 for HTTPS traffic. Different port configurations will be ignored and traffic will be routed to 80 or 443.

**Test Group/Test Category**
Remote Application Publishing Compatibility/Azure Application Services Tests

**Severity**
Warning

**Message**
Identified the port binding information other than 80 or 443 which will be ignored and traffic will be routed to port 80 or 443.

**Resolution**
Configure the Website to use port 80 for HTTP and 443 for HTTPS.

**See Also**
Migrate an enterprise web app to Azure App Service

**MAS0002: Authentication**

AdminStudio 2019 | Application Manager

---

**Edition** • This test is included in AdminStudio Professional and Enterprise Editions.

Azure Websites support Anonymous Authentication by default and Forms Authentication where specified by an application. Windows Authentication can be used by integrating with Azure Active Directory and ADFS only. All other forms of authentication, e.g., Basic Authentication, are not currently supported.

**Test Group/Test Category**
Remote Application Publishing Compatibility/Azure Application Services Tests

**Severity**
Error

**Message**
Identified the Authentications other than Anonymous, Form and Windows [ASSEMBLY_NAME]. All other forms of authentication are not currently supported.

**Resolution**
Presence of Authentication other than Anonymous, Form and Windows need to be avoided.

**See Also**
Migrate an enterprise web app to Azure App Service
MAS0003: Global Assembly Cache (GAC)

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

The GAC is not supported in Azure websites. If your application references assemblies which you usually deploy to the GAC, you will need to deploy to the application bin folder on Azure websites.

Test Group/Test Category
Remote Application Publishing Compatibility/Azure Application Services Tests

Severity
Warning

Message
Identified the presence of GAC assembly in this path [ASSEMBLY_NAME]. These need to be deployed to the Application bin folder on Azure websites.

Resolution
Deploy the GAC dlls along with application bin folder on Azure Websites.

See Also
Migrate an enterprise web app to Azure App Service

MAS0004: IIS5 Compatibility Mode

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

This is not supported on Azure Websites.

Test Group/Test Category
Remote Application Publishing Compatibility/Azure Application Services Tests

Severity
Error

Message
IIS 5 compatibility is not supported for Azure websites. Identified IIS version [MAJOR_VERSION, MINOR_VERSION] - [ASSEMBLY_NAME].
Chapter 16  Analyze Tests
Remote Application Publishing Compatibility Tests

Resolution
This is not supported on Azure Websites.

See Also
Migrate an enterprise web app to Azure App Service

MAS0005: Application Pools
AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

In Azure Websites, each site and its child applications run in the same application pool.

Test Group/Test Category
Remote Application Publishing Compatibility/Azure Application Services Tests

Severity
Warning

Message
More than one application pool has been identified for the applications under a single website [ASSEMBLY_NAME]. Try to consolidate them to one or create a separate website for each application.

Resolution
If your site has multiple child applications utilizing multiple application pools, consolidate them to a single application pool with common settings or migrate each application to a separate website.

See Also
Migrate an enterprise web app to Azure App Service

MAS0006: COM and COM+ Components
AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

Azure Websites do not allow the registration of COM Components on the platform.

Test Group/Test Category
Remote Application Publishing Compatibility/Azure Application Services Tests
**Severity**
Warning

**Message**
Presence of COM and COM+ component has been identified [ASSEMBLY_NAME]. This must be rewritten into the managed code and deployed with website or application.

**Resolution**
If your websites or applications make use of any COM Components, you must rewrite them in managed code and deploy them with the website or application.

**See Also**
Migrate an enterprise web app to Azure App Service

---

**MAS0007: ISAPI Filters**

**Test Group/Test Category**
Remote Application Publishing Compatibility/Azure Application Services Tests

**Severity**
Warning

**Message**
Identified the presence of ISAPI filter [ASSEMBLY_NAME]. Deploy the dll with the site, register the dll via web.config and place apphostconfig.xdt in the application site root folder with content. For more info, refer to http://azure.microsoft.com/en-us/documentation/articles/web-sites-migration-from-iis-server/.

**Resolution**
ISAPI filters need to be deployed with site and registered via the web.config.

**See Also**
Migrate an enterprise web app to Azure App Service
Chapter 16  Analyze Tests
Remote Application Publishing Compatibility Tests

MAS0008: Migration of Other Components Like SSL, FTP

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

Other components like SharePoint, front page server extensions (FPSE), FTP, and SSL certificates will not be migrated.

Test Group/Test Category
Remote Application Publishing Compatibility/Azure Application Services Tests

Severity
Error

Message
Identified the presence of other migration components like FTP, SSL [ASSEMBLY_NAME]. This won't be migrated. Manually reconfigure after the migration is complete.

Resolution
Manually reconfigure the other components like SSL, FTP after the migration is complete.

Remote Desktop Services Tests

AdminStudio 2019 | Application Manager

Edition • The Remote Desktop Services tests are included in the AdminStudio Professional and Enterprise Editions.

The following Remote Desktop Services tests are described in this section:

- WTS01: Per-User ALLUSERS Property Value for Remote Desktop Services
- WTS02: Registry Entries in Per-User Locations
- WTS03: Files in Per-User Locations
- WTS04: ODBC Data Source Entries in Per-User Locations
- WTS05: Per-User Environment Variables
- WTS06: Executable Files with Disabled TSAWARE Flags
- WTS07: TerminalServer or RemoveAdminTS Conditions
- WTS08: 16-Bit Binary Files
- WTS09: Administrator Manifest for Binary Files
WTS01: Per-User ALLUSERS Property Value for Remote Desktop Services

AdminStudio 2019 | Application Manager

*Edition • This test is included in AdminStudio Professional and Enterprise Editions.*

WTS01 checks whether the `ALLUSERS` property is defined with a per-user value. In general, Windows Remote Desktop Services require installations to be installed for all users.

*Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.*

**Test Group/Test Category**
Remote Application Publishing Compatibility/Remote Desktop Services Tests

**Severity**
Error

**Message**
The product `[PRODUCT_NAME]` (`[VERSION]`) is currently configured to be installed as per-user. This value affects deployment of this package in a terminal server environment.

**Background**
WTS01 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require installations to be installed for all users, rather than on a per-user basis. If the package is configured to be installed for the current user, WTS01 fails.

**Resolution**

*Automatic Fix (WTSFIX)*
WTSFIX01 automatically sets the value of the `ALLUSERS` property to 1.

WTS02: Registry Entries in Per-User Locations

AdminStudio 2019 | Application Manager

*Edition • This test is included in AdminStudio Professional and Enterprise Editions.*

WTS02 checks for any registry entries that are installed to per-user specific locations. In general, Windows Remote Desktop Services require registry entries to be installed for all users.

*Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.*
Chapter 16  Analyze Tests
Remote Application Publishing Compatibility Tests

Test Group/Test Category
Remote Application Publishing Compatibility/Remote Desktop Services Tests

Severity
Error

Message
The component [COMPONENT_NAME] in package [PACKAGE_NAME]([VERSION]) contains a per-user registry key [KEY_NAME] with KeyPath [KEYPATH_VALUE]. This value affects deployment of this package in a terminal server environment.

Background
WTS02 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require registry entries to be installed for all users, rather than on a per-user basis. If the package contains registry entries that are configured to be installed to per-user locations, WTS02 fails.

Resolution
Automatic Fix (WTSFIX)
WTSFIX02 automatically clears the key path entry for the identified resource to ensure that Windows Installer repair mode is not invoked.

WTS03: Files in Per-User Locations

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS03 checks whether any of the files in the package are configured to be installed to per-user locations. In general, Windows Remote Desktop Services require files to be installed for all users.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

Test Group/Test Category
Remote Application Publishing Compatibility/Remote Desktop Services Tests

Severity
Error

Message
The component '[COMPONENT_NAME]' in package '[PACKAGE_NAME]'([VERSION]) has a per-user destination '[PATH_NAME]'. This value affects deployment of this package in a terminal server environment.
Background

WTS03 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require files to be installed for all users, rather than on a per-user basis. If the package contains one or more files that are configured to be installed to per-user locations, WTS03 fails.

Resolution

Automatic Fix (WTSFIX)

WTSFIX03 automatically clears the key path entry for the identified resource to ensure that Windows Installer repair mode is not invoked.

WTS04: ODBC Data Source Entries in Per-User Locations

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS04 checks for any ODBC data source entries in the package are configured to be installed to per-user locations.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

Test Group/Test Category

Remote Application Publishing Compatibility/Remote Desktop Services Tests

Severity

Error

Message

The component 'COMPONENT_NAME' in package 'PACKAGE_NAME'('VERSION') has a per-user ODBC Data Source 'NAME'('VALUE'). This value affects deployment of this package in a terminal server environment.

Background

WTS04 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require ODBC data source entries to be installed for all users, rather than on a per-user basis. If the package contains one or more ODBC data source entries that are configured to be installed to per-user locations, WTS04 fails.

Resolution

Automatic Fix (WTSFIX)

WTSFIX04 automatically clears the key path entry for the identified resource to ensure that Windows Installer repair mode is not invoked.
WTS05: Per-User Environment Variables

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS05 checks whether any environment variables in the package are configured to be installed for the current user. In general, Windows Remote Desktop Services require environment settings to be installed for all users.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

Test Group/Test Category
Remote Application Publishing Compatibility/Remote Desktop Services Tests

Severity
Warning

Message
The component '[COMPONENT]' in package '[PACKAGE_NAME]' has a per-user Environment Setting '[NAME]':'[VALUE]'). This value affects deployment of this package in a terminal server environment.

Background
WTS05 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require environment variables to be installed for all users, rather than on a per-user basis. If the package contains one or more environment variables that are configured to be installed per user, WTS05 fails.

Resolution

Manual Fix
Duplicate the per-user Environment table entries and conditionalize the component that contains these new Environment table entries to be installed only if the ALLUSERS property is set to 1 for all users.

WTS06: Executable Files with Disabled TSAWARE Flags

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS06 checks a package to make sure that all of the executable files that it contains have the TSAWARE flag enabled.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.
**Test Group/Test Category**
Remote Application Publishing Compatibility/Remote Desktop Services Tests

**Severity**
Error

**Message**
The binary '[EXECUTABLE_FILE_NAME]' in package '[PACKAGE_NAME]' does not have the TSAWARE flag set. This affects the deployment of this package in a terminal server environment.

**Background**
WTS06 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Windows Remote Desktop Services generally require executable files to be marked as Terminal Server aware. If the package contains one or more executable files that have the TSAWARE flag disabled, WTS06 fails.

**Resolution**

**Manual Fix**
To resolve this issue, remove from the package the executable file that does not have the TSAWARE flag enabled.

**WTS07: TerminalServer or RemoveAdminTS Conditions**

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS07 checks the LaunchCondition table of a package and the conditions for custom actions for use of the TerminalServer property or the RemoteAdminTS property.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

**Test Group/Test Category**
Best Practices/Remote Desktop Services Tests

**Severity**
Warning or error

**Messages**
- The InstallExecuteSequence/InstallUISequence table has a Type 19 CustomAction [ACTION] with the condition [CONDITION]. This may affect the deployment of this package in a terminal server environment.
The LaunchCondition table has the condition [CONDITION]. This may affect the deployment of this package in a terminal server environment.

**Background**

WTS07 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. If the package contains one or more conditions that use the TerminalServer property or the RemoteAdminTS property, WTS07 fails.

**Resolution**

This issue cannot be resolved unless it is possible to delete the TerminalServer and RemoteAdminTS properties from the conditions in the package. To determine the ramifications of removing the condition, contact the software vendor.

---

**WTS08: 16-Bit Binary Files**

This test is included in AdminStudio Professional and Enterprise Editions.

WTS08 checks a package for 16-bit applications. Windows Server 2008 R2 and later are 64-bit systems, and they cannot run 16-bit applications.

**Note** • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

**Test Group/Test Category**

Remote Application Publishing Compatibility/Remote Desktop Services Tests

**Severity**

Error

**Message**

The binary '[FILE_NAME]' in package '[PACKAGE_NAME]'('[PACKAGE_NAME]') is 16-bit. This affects the deployment of this package in a terminal server environment.

**Background**

WTS08 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. If the package contains one or more 16-bit binary files (.exe, .dll, or .ocx), WTS08 fails.

**Resolution**

**Manual Fix**

To resolve this issue, remove the specified 16-bit binary file from the Windows Installer package.
WTS09: Administrator Manifest for Binary Files

AdminStudio 2019 | Application Manager

Edition • This test is included in AdminStudio Professional and Enterprise Editions.

WTS09 checks a package for binary files (.exe, .dll, or .ocx) that have a manifest in which Administrator is defined as the required execution level.

Note • If your package is not targeting the Windows Remote Desktop Services environment, you do not need to run this ACE.

Test Group/Test Category
Remote Application Publishing Compatibility/Remote Desktop Services Tests

Severity
Error

Message
The binary 'FILE_NAME' in package 'PACKAGE_NAME' is manifested to run as Administrator. This affects the deployment of this package in a terminal server environment.

Background
WTS09 examines a Windows Installer package for compatibility with Windows Remote Desktop Services. Typically, users of Windows Remote Desktop Services do not have elevated privileges. Therefore, a file that has a manifest that defines the required execution level as Administrator is usually not a good candidate to run in a per-user environment.

If the manifest of a binary file (.exe, .dll, or .ocx) indicates that the Administrator execution level is required, WTS09 fails.

Resolution

Manual Fix
The only way to resolve this error is to remove the specified file from the Windows Installer package.

Analyze Tests Reference

AdminStudio 2019 | Application Manager

Edition • Analyze is included in the AdminStudio Professional and Enterprise Editions.

The Analyze Tests Reference section includes additional reference information in the following categories:

• Analyze Resolutions
• Creating Your Own Custom ACE Tests
Analyze Resolutions

**Edition** • Analyze is included in the AdminStudio Professional and Enterprise Editions.

- CARDs are included in AdminStudio Professional and Enterprise Editions.

Application Catalog offers different types of methods for resolving issues that are identified by Analyze tests:

- Resolutions for Operating System Compatibility and Browser Compatibility Tests
- Conflict Application Resolution Definitions (CARDs)

Resolutions for Operating System Compatibility and Browser Compatibility Tests

**Edition** • Analyze is included in the AdminStudio Professional and Enterprise Editions.

- The operating system tests are included in AdminStudio with Application Compatibility.
- The browser tests are included in AdminStudio Enterprise Application Compatibility.

The Operating System Compatibility and Browser Compatibility tests that are available in Analyze offer the following types of fixes for the issues that the tests identify:

- **Basic auto fix**—This type of resolution is relatively safe. It results in minimal changes to an MSI package via a Windows Installer transform. It does not change the target system’s security or a system policy.

- **Advanced auto fix**—This type of resolution may result in a loss of functionality, and it may not resolve all types of issues. This type of fix may change the target system’s security or a system policy. One example of an advanced auto fix is the removal of a registry key that is protected by Windows Resource Protection.

- **Manual fix**—This type of resolution describes a procedure or task that you can perform to address an issue.

Some types of fixes are not applicable to some of the Operating System Compatibility and Browser Compatibility tests.

Conflict Application Resolution Definitions (CARDs)

**Edition** • Analyze is included in the AdminStudio Professional and Enterprise Editions.

CARDs are included in AdminStudio Professional and Enterprise Editions.
Conflict Application Resolution Definitions (CARDs) are used to fix issues that Application Conflict Evaluators (ACEs) identify when conflict testing is performed.

The following table lists each individual CARD and its associated ACE. These CARDs are used to resolve conflicts between installation packages that were identified by the CARD’s corresponding ACE.

**Table 16-8 • CARD Index**

<table>
<thead>
<tr>
<th>CARD</th>
<th>Brief Description of ACE</th>
<th>Action Taken by CARD</th>
</tr>
</thead>
<tbody>
<tr>
<td>CARD02 for ACE02</td>
<td>Checks whether components in different packages that have matching ComponentIds also have identical destination paths.</td>
<td>The destination path of the component in the Source package is automatically set to match that of the component in the Target package. To learn more, see ACE02: Identical Components with Different Destinations.</td>
</tr>
<tr>
<td>CARD04 for ACE04</td>
<td>Checks whether components with no files and no key paths have an associated entry in the CreateFolder.</td>
<td>A CreateFolder entry is created for the component. To learn more, see ACE04: Components Without Files or Key Paths.</td>
</tr>
<tr>
<td>CARD05 for ACE05</td>
<td>Checks for the existence of more than one executable (EXE, DLL, OCX, HLP, CHM, TLB, SYS, DRV) per component in a Windows Installer package.</td>
<td>Modifies the component so that only one EXE or DLL exists, and it adds new components for remaining EXE, DLL, OCX, HLP, CHM, TLB, SYS, and DRV files. To learn more, see ACE05: More Than One Executable File Per Component.</td>
</tr>
<tr>
<td>CARD06 for ACE06</td>
<td>Checks whether the executable module (EXE, DLL, OCX, HLP, CHM, TLB, SYS, or DRV) within the component is the key file.</td>
<td>The executable module is automatically made the key file. To learn more, see ACE06: Executable File Not Marked as Key File of Component.</td>
</tr>
<tr>
<td>CARD07 for ACE07</td>
<td>Checks for the existence of the same file in components with different ComponentIds.</td>
<td>The Source package ComponentId is changed to match the Target package Component Id. To learn more, see ACE07: Same File in Different Components.</td>
</tr>
<tr>
<td>CARD15 for ACE15</td>
<td>Checks for the existence of identical ODBC entries in components with different ComponentIds.</td>
<td>Application Catalog changes the Source ComponentId to match that of the Target ComponentId. To learn more, see ACE15: Duplicate ODBC Entries in Different Components.</td>
</tr>
</tbody>
</table>
Note • Issues that are found by ACEs and that do not have associated CARDs must be resolved manually.

Creating Your Own Custom ACE Tests

In addition to using the built-in ACEs that are shipped with Application Catalog, you can also create your own company-specific tests for use when detecting conflicts. For example, your organization may want to identify (and change) any VBScript custom actions that have a hard-coded drive letter, any applications that create desktop or uninstall shortcuts, any applications that have Startup registry entries, or any applications that place files in the system directory. You can create custom tests to identify these (and many more company-specific situations) using Application Catalog.

Note • Use the Rules Wizard to create user-defined ACEs. To open the Rules Wizard, open the ACE Tests tab of the Application Catalog Options dialog box, click the View Rules button to open the Rules Viewer dialog box, and then click the New button. The Rules Wizard opens. See Rules Wizard for more information.

Types of User-Defined ACEs

In addition to the ACEs included with Application Catalog, you can also create your own user-defined ACEs to use when detecting conflicts. You can create three types of ACEs:

Custom - Source Only Packages ACEs

Custom - Source Only Packages ACEs allow you to quickly test any column or any value of a table to support your business logic. For example, you could use a user-defined ACE to identify packages that create a desktop icon. To define a Source Only Packages ACE, you must define an SQL “Where” clause.

For an example of this type of user-defined ACE, see Creating a Custom/Source Only Packages ACE.

Note • Application Catalog supports external package conflict checking for Custom - Source Only Packages ACEs. The Source package can be selected from the Application Catalog Database or from an external MSI package.

Custom - Source and Target Packages ACEs

Custom - Source and Target Packages ACEs allow you to compare columns or values of Source package tables (new packages that you want to install onto a user’s system) to columns or values of Target package tables (packages already installed on a user’s system).
For example, you could use a Source and Target Packages ACE to determine if the installation of a Source package onto a Target system would overwrite or conflict with an existing entry in the .ini file in the System directory of the Target system.

To define a Source and Target Packages ACE, you must define an SQL “Where” clause, and specify a Join Column—a table column in the Application Catalog database that has a matching value for both the Source and Target packages. Rows in each of the packages that have a matching value in the Join Column are selected and those rows are checked against the Source and Target Packages.

For an example of this type of user-defined ACE, see Creating a Custom/Source and Target Packages ACE.

**Note** • *Application Catalog does not support external package conflict checking for Custom - Source and Target Packages ACEs. Both the Source and Target Packages must be selected from the Application Catalog Database.*

**DLL - User Provided DLL Based ACEs**

DLL - User Provided DLL Based ACEs allow you to run more complex tests—testing many tables in any combination. For example, you could use a DLL-Based ACE to confirm that a source product language is the same as all target product languages. To define a DLL-Based ACE, you use SQL and various programming languages to construct a Windows DLL. With DLL-Based ACEs, you can use a Conflict Application Resolution Definition (CARD) to fix the conflict.

For an example of this type of user-defined ACE, see Creating a User Provided DLL-Based ACE.

**Where You Create User-Defined ACEs**

When creating ACEs, you need to provide basic information for display in the Rules Viewer dialog box, on the ACE Tests tab of the Options dialog box, and in the Output window. You must associate a table with the ACE. You also must categorize the ACE (by either using existing ACE categories or creating your own).

**Note** • *Use the Rules Wizard to create user-defined ACEs. To open the Rules Wizard, open the ACE Tests tab of the Application Catalog Options dialog box, click the View Rules button to open the Rules Viewer dialog box, and then click the New button. The Rules Wizard opens. See Rules Wizard for more information.*

**Creating User-Defined ACEs**

**Edition** • *This functionality is included in the AdminStudio Professional and Enterprise Editions.*

The section describes how to create the three types of user-defined ACEs:

- Creating a Custom/Source Only Packages ACE
- Creating a Custom/Source and Target Packages ACE
- Creating a User Provided DLL-Based ACE

**Note** • *You can create user-defined ACEs for both Windows Installer and App-V packages.*
Creating a Custom/Source Only Packages ACE

AdminStudio 2019 | Application Manager

Edition • This functionality is included in the AdminStudio Professional and Enterprise Editions.

You can create a user-defined ACE to apply to Source Only Packages. One common task you may want to create a Source Only Packages ACE to handle is to identify packages which create a desktop icon.

Application Catalog supports external package conflict checking for Custom - Source Only Packages ACEs. The Source package can be selected from the Application Catalog database or from an external package.

Task

To create a Source Only Packages ACE that identifies desktop icon creation:

1. Launch Application Catalog.
2. On the Application Catalog tab menu, click Options. The Options dialog box opens.
3. On the ACE Tests tab, click the View Rules button. The Rules Viewer dialog box opens.
4. Click the New button. The Rules Wizard opens.
5. Complete the wizard panels to create your ACE:
   a. On the General Information panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>MYACE</td>
</tr>
<tr>
<td>Associated Table</td>
<td>csms1Shortcut</td>
</tr>
<tr>
<td>Package Type</td>
<td>MSI</td>
</tr>
<tr>
<td>Brief Description</td>
<td>MYACE - Find desktop icons</td>
</tr>
<tr>
<td>Description</td>
<td>Locates package that create desktop icons.</td>
</tr>
<tr>
<td>Information URL</td>
<td><a href="http://www.yourcompany.com/MYACE.htm">http://www.yourcompany.com/MYACE.htm</a></td>
</tr>
</tbody>
</table>

b. On the Additional Information panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Shortcuts</td>
</tr>
<tr>
<td>Rule Type</td>
<td>Custom - Source Only Packages</td>
</tr>
</tbody>
</table>

c. On the Custom Options panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error String</td>
<td>Desktop icons [Name] are not allowed.</td>
</tr>
<tr>
<td>Display String</td>
<td>A desktop icon called [Name] is created.</td>
</tr>
</tbody>
</table>
In the example above, [Name] is a token. Tokens allow you to insert values at run-time from the internal Application Catalog Database or from an external MSI package into the Error or Display string. To use token replacement in a string, click the arrow to the right of the Error String and Display String text boxes and select a column name from the list. The column name is then inserted into the string in the following format: [ColumnName].

The Token list is provided for your convenience; if you prefer, you can type the tokens directly in the text boxes. You could also use the [ProductName] pseudo-token to insert the name of the package in a message, even though ProductName is not a table column name.

Note • For more information, see Token Grammar

d. On the Where Clause panel, in the Where Clause panel, click Build Expression. The Expression Builder dialog box opens.

e. In the Expression Builder, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Columns</td>
<td>[Directory_]</td>
</tr>
<tr>
<td>Comparison Operator</td>
<td>= (Equal To)</td>
</tr>
<tr>
<td>String Constant</td>
<td>DesktopFolder</td>
</tr>
</tbody>
</table>

f. Click OK to close the Expression Builder and return to the Where Clause panel. The expression that you just built is now displayed in the Where Clause text box:

[Directory_] = 'DesktopFolder'

When you are constructing simple expressions, it is helpful to use the Expression Builder dialog box, but you are not limited to the formatting options that the Expression Builder provides to you. If you know how to write Where clauses in SQL, you can use significantly more powerful expressions by entering them directly in the Where Clause text box on the Where Clause panel or on the Where Clause tab of the ACE Rule Properties Dialog Box.

g. Click the Test button to validate the expression.

h. On the Summary panel, review the summary of your new ACE and click the Finish button.

6. Click the Close button. The Rules Viewer dialog box closes.

This new user-created ACE is now available for use in subsequent testing.

Types of User-Defined ACEs
Creating a Custom/Source and Target Packages ACE

This functionality is included in the AdminStudio Professional and Enterprise Editions.

You can create a custom ACE to apply to Source and Target Packages. For example, you could use a Source and Target Packages ACE to determine if the installation of a Source package onto a Target system would overwrite or conflict with an existing entry in the .ini file in the System directory of the Target system.

Caution • Application Catalog does not support external package conflict checking for Custom - Source and Target Packages ACEs. Both the Source and Target Packages must be selected from the Application Catalog Database. If you attempt to run a conflict check on an external MSI package using a Source and Target Packages ACE, that custom ACE will not be executed.

Task • To create a Source and Target Packages ACE that identifies .ini file conflicts:

1. Launch Application Catalog.
2. On the Application Catalog tab menu, click Options. The Options dialog box opens.
3. On the ACE Tests tab, click the View Rules button. The Rules Viewer dialog box opens.
4. Click the New button. The Rules Wizard opens.
5. Complete the wizard panels to create your ACE:

   a. On the General Information panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>INICheck</td>
</tr>
<tr>
<td>Associated Table</td>
<td>csmsiIniFile</td>
</tr>
<tr>
<td>Package Type</td>
<td>MSI</td>
</tr>
<tr>
<td>Brief Description</td>
<td>INICheck - Identifies conflicts found in an .ini file.</td>
</tr>
<tr>
<td>Description</td>
<td>Determines if the installation of a Source package onto a Target system would overwrite or conflict with an existing entry in the .ini file in the Target system's System directory.</td>
</tr>
<tr>
<td>Information URL</td>
<td><a href="http://www.yourcompany.com/INICheck.htm">http://www.yourcompany.com/INICheck.htm</a></td>
</tr>
</tbody>
</table>

   b. On the Additional Information panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>INI Files</td>
</tr>
<tr>
<td>Rule Type</td>
<td>Custom - Source and Target Package</td>
</tr>
</tbody>
</table>
c. On the **Custom Options** panel, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Error String</strong></td>
<td>The INI file called [Source.FileName] in the directory [Source.csFullPath] writes to the [Source.Section] section which is also written by the target package, [Target.ProductName].</td>
</tr>
<tr>
<td><strong>Display String</strong></td>
<td>The INI file called [Source.FileName] in the directory [Source.csFullPath] writes to the [Source.Section] section.</td>
</tr>
<tr>
<td><strong>Severity</strong></td>
<td>Warning</td>
</tr>
<tr>
<td><strong>Report 'No' Results</strong></td>
<td>Deselected</td>
</tr>
</tbody>
</table>

In the example above, [Source.FileName], [Source.csFullPath] and [Source.Section] are tokens. Tokens allow you to insert values at runtime from the internal Application Catalog Database into the Error or Display string. To use token replacement in a string, click the arrow to the right of the Error String or Display String text boxes and select a column name from the list. The column name is then inserted into the string in the format of [Source.ColumnName] or [Target.ColumnName], with the prefix identifying whether the column is in the Source or Target package.

*Note • If no prefix is used, Application Catalog assumes the “Source.” prefix.*

You can also use the [Target.ProductName] and [Source.ProductName] pseudo-tokens to insert the name of the Source or Target package in a message, even though ProductName is not a table column name.

*Note • The Token list is provided for your convenience; if you prefer, you can type the variables directly in the text boxes. For more information, see Token Grammar.*

d. On the **Where Clause** panel, in the **Where Clause** panel, click **Build Expression**. The **Expression Builder** dialog box opens.

e. In the **Expression Builder**, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table Columns</strong></td>
<td>[Source].[csFullPath]</td>
</tr>
<tr>
<td><strong>Comparison Operator</strong></td>
<td>= (Equal To)</td>
</tr>
<tr>
<td><strong>String Constant</strong></td>
<td>SystemFolder</td>
</tr>
</tbody>
</table>

f. Click **OK** to close the **Expression Builder** and return to the **Where Clause** panel. The expression that you just built is now displayed in the **Where Clause** text box:

[Source].[csFullPath] = 'SystemFolder'

*Note • When you are constructing simple expressions, it is helpful to use the Expression Builder dialog box, but you are not limited to the formatting options that the Expression Builder provides to you. If you know how to write Where
clauses in SQL, you can use significantly more powerful expressions by entering them directly in the Where Clause text box on the Where Clause panel or on the Where Clause tab of the ACE Rule Properties Dialog Box.

g. Click Build Expression again to open the Expression Builder.

h. In the Expression Builder, enter the following values:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Columns</td>
<td>[Source].[Section]</td>
</tr>
<tr>
<td>Comparison Operator</td>
<td>= (Equal To)</td>
</tr>
<tr>
<td>String Constant</td>
<td>[Target].[Section]</td>
</tr>
<tr>
<td>Expression Operator</td>
<td>AND</td>
</tr>
</tbody>
</table>

Note • When using the Expression Builder dialog box to create a Source and Target Packages custom ACE to compare the value of a column in the source table to the value of a column in the target table, you can select the first table column name from the Table Columns list. However, you have to manually enter the second table column name in the Constant text box. When doing so, enter the table column name using the same syntax that is used in the Table Columns list: [Source].[ColumnName] or [Target].[ColumnName].

i. Click OK to close the Expression Builder and return to the Where Clause panel. The expression that you just built is now displayed in the Where Clause text box, added to the end of the first expression you built:

[Source].[csFullPath] = 'SystemFolder' AND [Source].[Section] = '[Target].[Section]'

j. In the Join Column list, select csFullPath.

The Join Column is a table column in the Application Catalog database that has a matching value for both the Source and Target packages. Rows in each of the packages that have a matching value in the Join Column are selected and those rows are checked against the Source and Target Packages.

k. Click the Test button to validate the expression. A message appears stating that the query executed properly.

l. On the Summary panel, review the summary of your new ACE and click the Finish button.

6. Click the Close button. The Rules Viewer dialog box closes.

This new Custom ACE is now available for use in subsequent testing.

Types of User-Defined ACEs

Creating a User Provided DLL-Based ACE

AdminStudio 2019 | Application Manager

Edition • This functionality is included in the AdminStudio Professional and Enterprise Editions.

To demonstrate how to create a DLL-Based ACE, an ACE SDK was installed with AdminStudio, in the following directory:
Included in this directory is a Visual Studio 2008 DLL-based project, which is a fully formed example ACE. This example includes utility functions that allow you to integrate your own ACE execution within our conflict persistence model.

**Specifying the Visual Studio 2008 Type Library File Path**

Application Catalog provides a data structure to each ACE constructed using the ACE SDK. This data structure includes an ADO Connection interface, which is the means by which you can execute queries against the Application Catalog.

In order to build the ACE SDK, you will need to make sure that Visual Studio can locate the needed files for ADO.

The first time you create a DLL-based ACE, you need to open Visual Studio 2008 and specify the path for the type library file (msado15.d11) by performing the following steps:

---

**Task**  
**To specify the Visual Studio 2008 type library file path:**

2. Select **Options** from the **Tools** menu. The **Options** dialog box opens.
3. Under **Projects and Solutions > VC++ Directories**, set the **Platform** field to **Win32** and the **Show directories for** field to **Library files**.
4. In the directories list, specify the location of the needed files for an ADO Connection interface. The directory specified below is a likely common directory for storing these files:
   
   C:\Program Files\Common Files\System\ADO

5. Click **OK** to exit the **Options** dialog box.

---

**Caution** • If you fail to specify the correct Library files path, you will encounter the following error when building an ACESDK project with Visual Studio 2008:

*Fatal error C1083: Cannot open type library file: 'msado15.d11'; No such file or directory*

**Creating a DLL-Based ACE**

To learn how to create a DLL-Based ACE, use the ACE SDK files to perform the following steps:

---

**Task**  
**To create a DLL-based ACE:**

1. Launch Windows Explorer and navigate to the following directory:

   [AdminStudioInstallDirectory]\Common\ACESDK

2. Copy this folder and its contents and store it in a convenient location.
3. Launch Visual Studio 2008 and open the ACESDK.dsp project file within that newly created folder.
4. Review the code and make any desired changes.
7. On the **Application Catalog** tab menu, click **Options**. The **Options** dialog box opens.

8. On the **ACE Tests** tab, click the **View Rules** button. The **Rules Viewer** dialog box opens.

9. Click the **View Rules** button. The **Rules Viewer** dialog box opens.

10. Click the **New** button. The **Rules Wizard** opens.

11. Complete the wizard panels to create your ACE:
   
   a. On the **General Information** panel, enter the following values:

      | Option             | Value                      |
      |--------------------|----------------------------|
      | Name               | ACELanguage                |
      | Associated Table   | csmsiProperty              |
      |                    | (This is the Application Catalog table that is associated with this example ACE.) |
      | Package Type       | MSI                        |
      | Brief Description  | ACELanguage - Check product language consistency. |
      | Description        | Confirm that source product language is the same as all target product languages. |
      | Information URL    | http://www.yourcompany.com/ACELanguage.htm |

   b. On the **Additional Information** panel, enter the following values:

      | Option       | Value                                            |
      |--------------|--------------------------------------------------|
      | Category     | Type in a new category name: Product Language    |
      | Rule Type    | DLL - User Provided DLL                          |

   c. On the **DLL-Based ACEs** panel, enter the following values:

      | Option             | Value                                              |
      |--------------------|----------------------------------------------------|
      | ACE/CARD DLL File | Click Browse and select the DLL that you built in Step 5 above. |
      | ACE Function Name  | ExampleACE (as designed in the sample)            |
      | CARD Function Name | ExampleCARD (as designed in the sample)           |

   d. Click **Test** next to **ACE Function Name** or **CARD Function Name** to validate that the exported function does exist.

   e. On the **Summary** panel, review the summary of your new ACE and click **Finish**.

12. Click the **Close** button. The **Rules Viewer** closes.

This new DLL-Based ACE is now available for use in subsequent testing.

**See Also**

*Types of User-Defined ACEs*
Editing User-Defined ACEs

To edit a user-defined ACE:

1. Launch Application Catalog.
2. On the Application Catalog tab menu, click Options. The Options dialog box opens.
3. On the ACE Tests tab, click the View Rules button. The Rules Viewer dialog box opens.
4. Click the View Rules button. The Rules Viewer dialog box opens.
5. In the Rules box, select the user-defined ACE you want to modify and then click the Edit button. The ACE Rule Properties dialog box opens.
6. Edit the options as necessary.
7. Click OK.
8. Click the Close button. The Rules Viewer dialog box closes.

The modified ACE is available for use in subsequent testing.

Types of User-Defined ACEs

Deleting User-Defined ACEs

To delete a user-defined ACE:

1. Launch Application Catalog.
2. On the Application Catalog tab menu, click Options. The Options dialog box opens.
3. On the ACE Tests tab, click the View Rules button. The Rules Viewer dialog box opens.
4. Click the View Rules button. The Rules Viewer dialog box opens.
5. Select the ACE you want to remove and click the Delete button.
6. Confirm the deletion.
The user-defined ACE is removed from the available tests. If this ACE was the only one in a user-defined ACE category, the category will be removed when you close the Rules Viewer dialog box.

### Viewing ACE Metrics

**Edition** • *This functionality is included in the AdminStudio Professional and Enterprise Editions.*

When ACEs are run, Application Catalog generates metrics and logs them in the AceLog.txt file, located in the following directory:

*AdminStudio* | Application Manager

**Edition** • This functionality is included in the AdminStudio Professional and Enterprise Editions.

When ACEs are run, Application Catalog generates metrics and logs them in the AceLog.txt file, located in the following directory:

AdminStudio \Shared\ConflictSolver\AceLog.txt

The following is an example of the beginning of an AceLog.txt file:

11/06/03 09:26:35 ACE/CARD Execution started

----------------------------------------------
ACE03
----------------------------------------------

SELECT DISTINCT csmsiComponent.Component,
csmsiComponent.ComponentId,csmsiComponent.RowID
FROM csmsiComponent WHERE csmsiComponent.PkgRowID_ = 5

Records returned =>(124)
Query Time =>(0.23 seconds)

</table>

Note • The location of the AdminStudio Shared directory is specified on the AdminStudio Shared Location panel of the AdminStudio installation wizard.

Application Catalog requires that the Standard ACE and Merge Module ACE files remain in their installed location. However, you can change the location of the Custom ACE file by opening the ACE Tests tab of the Application Catalog Options dialog box, and editing the path in the Custom ACE Rule File field.
Analyzing the Impact of Installing Microsoft Operating System Security Patches

Support for importing Microsoft OS Security Patch files and the Patch Impact Analysis Wizard are included with AdminStudio Enterprise Edition.

You can import Microsoft OS patch information into the Application Catalog so that you can analyze the full impact of installing these patches on user machines. Based on the analysis results, you can determine the level of testing you need to perform before distributing a Microsoft OS patch throughout your enterprise.

You can import Microsoft security patch files into the Application Catalog using the Import Wizard. You can then analyze the impact of installing a security patch file using the Patch Impact Analysis wizard.

Information about the patch impact analysis is presented in the following sections:

Table 17-1 • Patch Impact Analysis Help Library

About Microsoft Operating System Patch Files

AdminStudio 2019 | Patch Impact Analysis

Each month, Microsoft releases patches to address security vulnerabilities that are discovered in Microsoft operating system software. Microsoft defines security vulnerabilities as:

“A flaw in a product that makes it infeasible— even when using the product properly—to prevent an attacker from usurping privileges on the user’s system, regulating its operation, compromising data on it, or assuming ungranted trust.”

Microsoft publishes a monthly Microsoft Security Bulletin Summary that lists the patches released that month. You can view these bulletins on the Microsoft Security TechCenter website:

https://technet.microsoft.com/security/bulletin

The Microsoft Security Bulletin Summary for July 2014 is shown in the following figure:

Identifying and Downloading Microsoft Operating System Patch Files
Importing a Microsoft Operating System Security Patch Into the Application Catalog

Importing Microsoft OS Security Patch Files

AdminStudio 2019 | Patch Impact Analysis

You can use the Import Wizard to import Microsoft operating system patch files (.msu) into the AdminStudio Application Catalog one at a time.

Tip - You can also use the Package Auto Import feature to batch import multiple patch files from a monitored directory. For more information, see Automatically Importing Packages from a Network Directory.

Information about importing Microsoft operating system security patches is presented in the following sections:

- Identifying and Downloading Microsoft Operating System Patch Files
- Importing a Microsoft Operating System Security Patch Into the Application Catalog

Identifying and Downloading Microsoft Operating System Patch Files

AdminStudio 2019 | Patch Impact Analysis

To identify and obtain the Microsoft OS security patch files that you want to import into the Application Catalog, perform the following steps.
Chapter 17  Analyzing the Impact of Installing Microsoft Operating System Security Patches
Importing Microsoft OS Security Patch Files

**Task**

To identify and download Microsoft OS patch files:

1. Open the Microsoft Security Bulletin Summary that lists the patch that you want to import. The following figure is of the Microsoft Security Bulletin Summary for July 2014:

   ![Microsoft Security Bulletin Summary](image)

   In this example, under **Executive Summaries**, 18 patch files are listed, all with a status of **Critical**.

2. Locate the bulletin that contains the OS security patch file that you want to download. The following is an example of Cumulative Security Update for Internet Explorer:

   **Executive Summaries**

   The following table summarizes the security bulletins for this month in order of severity.

   ![Executive Summaries Table](image)
3. Click the link in the **Bulletin ID** field. The Security Bulletin for that patch opens. In this example, Security Bulletin MS14-037 opens:

![Microsoft Security Bulletin MS14-037 - Critical](image)

**Cumulative Security Update for Internet Explorer (2975687)**

Published: July 8, 2014

**Version:** 1.0

**General Information**

**Executive Summary**

This security update resolves one publicly disclosed vulnerability and twenty-three privately reported vulnerabilities in Internet Explorer. The most severe of these vulnerabilities could allow remote code execution if a user views a specially crafted webpage using Internet Explorer. An attacker who successfully exploited these vulnerabilities could gain the same user rights as the current user. Customers whose accounts are configured to have fewer user rights on the system could be less impacted than those who operate with administrative user rights.

This security update is rated Critical for Internet Explorer 6 (IE 6), Internet Explorer 7 (IE 7), Internet Explorer 8 (IE 8), Internet Explorer 9 (IE 9), Internet Explorer 10 (IE 10), and Internet Explorer 11 (IE 11) on affected Windows clients, and Moderate for Internet Explorer 6 (IE 6), Internet Explorer 7 (IE 7), Internet Explorer 8 (IE 8), Internet Explorer 9 (IE 9), Internet Explorer 10 (IE 10), and Internet Explorer 11 (IE 11) on affected Windows servers. For more information, see the [Affected and Non-Affected Software](#) section.

The security update addresses the vulnerabilities by modifying the way that Internet Explorer handles objects in memory, validates permissions, and handles negotiation of certificates during a TLS session. For more information about the vulnerabilities, see the [Frequently Asked Questions (FAQ)](#) subsection for the specific vulnerability entry later in this bulletin.

**Recommendation.** Most customers have automatic updating enabled and will not need to take any action because this security update will be downloaded and installed automatically. For information about specific configuration options in automatic updating, see Microsoft Knowledge Base Article 294871. For customers who do not have automatic updating enabled, the steps in Turn automatic updating on or off can be used to enable automatic updating.

In the Security Bulletin, the **Affected Software** table lists the software affected by this patch, and provides a link to the download page for that specific patch:

### Affected and Non-Affected Software

The following software has been tested to determine which versions or editions are affected. Other versions or editions are either past their support life cycle or are not affected. To determine the support life cycle for your software version or edition, see Microsoft Support Lifecycle.

<table>
<thead>
<tr>
<th>Operating System</th>

Importing a Microsoft Operating System Security Patch Into the Application Catalog

---

**Importing a Microsoft Operating System Security Patch Into the Application Catalog**

AdminStudio 2019 | Patch Impact Analysis

You can use the Import Wizard to import Microsoft operating system security patch files into the Application Catalog one at a time.

**Tip** • You can also use the Package Auto Import feature to batch import multiple patch files from a monitored directory. For more information, see Automatically Importing Packages from a Network Directory.

To import a Microsoft operating system security patch file into the Application Catalog using the Import Wizard, perform the following steps:

**Task**  
**To import a Microsoft OS security patch file into the Application Catalog:**

1. On the **Home** tab, open the **Environment** tree and select either the **Security Patches** group or one of its subgroups.
2. Click **Import** in the ribbon. The **Security Patch File Selection** panel of the **Import Wizard** opens.
3. Click **Browse** and select a Microsoft patch file (.msu) that you have downloaded from the Microsoft Security TechCenter, as described in Identifying and Downloading Microsoft Operating System Patch Files.
4. Click **Next**. The **Summary** panel opens.
5. Click **Next** to begin the import. The **Running the Import** panel opens and displays progress messages.
6. When the import is complete, click **Finish** to close the Import Wizard. The patch is now displayed in the tree on the **Environment** tab.

---

**Analyzing the Impact of Installing a Microsoft Operating System Patch**

AdminStudio 2019 | Application Manager

**Edition** • Support for importing Microsoft Security Patch files and the Patch Impact Analysis Wizard are included with AdminStudio Enterprise Edition.
After you have imported a Microsoft operating system patch into the AdminStudio Application Catalog as described in Importing Microsoft OS Security Patch Files, you can use the Application Catalog Patch Impact Analysis Wizard to identify conflicts between Microsoft operating system security patches and the packages and OS Snapshots in the Application Catalog. This helps you determine how specific MSI packages or OS Snapshots would be affected when a Microsoft operating system patch is installed.

The section is organized in the following topics:

- Performing Patch Impact Analysis
- Viewing Patch Impact Analysis Results
- Viewing Patch and Patch Impact Information in Application Catalog
- Generating the Patch Report

See Also
Importing Microsoft OS Security Patch Files

Performing Patch Impact Analysis

AdminStudio 2019 | Application Manager

You can use the Patch Impact Analysis Wizard to identify conflicts between Microsoft operating system security patches and the packages and OS Snapshots in your Application Catalog. This helps you determine how specific MSI packages or OS Snapshots would be affected when a Microsoft OS patch is installed.

Task To perform patch impact analysis:

1. Import at least one Microsoft OS Security Patch file, as described in Importing a Microsoft Operating System Security Patch Into the Application Catalog.

2. On the Analyze tab, right-click on the application or group of applications that you want to perform patch impact analysis on, and select Launch Patch Impact Analysis Wizard from the shortcut menu. The Patch Impact Analysis Wizard will analyze the products you select here against the patches you will select.

   The Welcome panel of the Patch Impact Analysis Wizard opens.

3. Click Next. The OS Snapshot Panel opens.

4. Optionally, select an OS Snapshot to include in your analysis. The selected OS Snapshot will be used to identify specific file information for any patch impacts that are discovered. Only one OS Snapshot can be selected.

   Tip • The OS Snapshot serves as a representation of the underlying baseline system in your enterprise. If you include an OS Snapshot in your Patch Impact Analysis, then the file version information displayed in warning messages is derived from that OS Snapshot. If an OS Snapshot is not included in the analysis, the file version information will be displayed as
Chapter 17  Analyzing the Impact of Installing Microsoft Operating System Security Patches

Analyzing the Impact of Installing a Microsoft Operating System Patch

“unknown”. As such, it is recommended to include an OS Snapshot in your analysis because this allows a finer-tuned evaluation of impacts based upon file and version information.

5. Click Next. The **Source Patches Panel** opens.

6. On the **Source Patches Panel**, select the patches that you want to include in your analysis.

When searching for patches to include, you can use the **Filter by product** list to restrict the patches displayed on this panel. Also, to view more information on a patch, select the patch and click the **Patch Properties** button to open the **Patch Properties** dialog box.

7. After you have selected the patches that you want to include in your analysis, click **Next**. The **Summary Information Panel** opens, listing a summary of the options you selected in the Patch Impact Analysis Wizard.

8. Click **Finish** to accept these options and begin the Patch Impact Analysis. Analysis messages are listed in the **Output** tab of the Output Window.

When analysis is complete, patch conflicts are listed on the **Patch Impact** tab of the Output Window in table format.

**See Also**
- Viewing Patch and Patch Impact Information in Application Catalog
- Generating the Patch Report

### Viewing Patch Impact Analysis Results

AdminStudio 2019 | Application Manager

**Edition** • Support for importing Microsoft Security Patch files and the Patch Impact Analysis Wizard are included with AdminStudio Enterprise Edition.

After **Performing Patch Impact Analysis**, patch conflicts are listed on the **Patch Impact** tab of the Output Window in table format.

![Sample Patch Impact Analysis Results](image)

**Figure 17-3:** Sample Patch Impact Analysis Results
The following information is included in Patch Impact Analysis results:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patch</td>
<td>Name of a Windows Installer Patch.</td>
</tr>
<tr>
<td>Product</td>
<td>Name of a Package or an OS Snapshot in the Application Catalog.</td>
</tr>
<tr>
<td>Type</td>
<td>Identifies the type of the impact as either a File or a Registry impact.</td>
</tr>
</tbody>
</table>

**Note** • Windows Installer Patches rarely impact Registry Entries, so most of the identified impacts will be identified as File.

<table>
<thead>
<tr>
<th>Description</th>
<th>Description of how the Windows Installer Patch impacted with the package or OS Snapshot. For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>File 'CdrGfx.dll' in Package 'Coreldraw 12.0.0.458 v1.0' uses version 'Unknown' of file 'SystemFolder\RPCRT4.dll', but Patch 'WindowsXP-KB828741-x86-ENu.EXE' uses version '5.1.2600.1361' of the same file.</td>
</tr>
</tbody>
</table>

This warning message means that:

  and

- **Corel Draw**, Coreldraw 12.0.0.458 v1.0, installs a file that is dependent upon the same operating system file: RPCRT4.dll.

Therefore, this warning message means that you should evaluate Corel Draw on a system that includes this Windows Installer Patch to insure that you can safely distribute this package within your enterprise.

**Tip** • The OS Snapshot serves as a representation of the underlying baseline system in your enterprise. If you include an OS Snapshot in your Patch Impact Analysis, then the file version information displayed in warning messages is derived from that OS Snapshot. If an OS Snapshot is not included in the analysis, the file version information will be displayed as “unknown”. As such, it is recommended to include an OS Snapshot in your analysis because this allows a finer-tuned evaluation of impacts based upon file and version information.
Viewing Patch and Patch Impact Information in Application Catalog

AdminStudio 2019 | Application Manager

Patch content and analysis information can be viewed on the Application Catalog Products and Environment tabs.

- Viewing Patch Content Information
- Viewing Associated Patches
- Viewing Patch Impacts on the Products Tab

Viewing Patch Content Information

To view patch content information, perform the following steps.

1. Launch Application Catalog and, on the Home tab, open the Environment tree. The Security Patches Group View opens.

2. Expand the listing. All of the patches that have been imported into the Application Catalog are listed. Newly imported patches are listed in the New Security Patches Group.

3. Select a patch. The Patches View opens.

The following information on the selected patch is listed:

- **ID**—Microsoft Security Bulletin ID. Click on the ID number link to view this bulletin on the Microsoft website.
- **Title**—Title of patch
- **Release Date**—Date the patch was released by Microsoft.
- **KB Article**—Microsoft Knowledge Base article ID. Click on the KB Article link to view that article on the Microsoft website.

In Application Catalog, you can organize your patches into groups according to your business needs. See Organizing Your Application Catalog Using Groups.
Chapter 17  Analyzing the Impact of Installing Microsoft Operating System Security Patches
Analyzing the Impact of Installing a Microsoft Operating System Patch

- **Imported On**—Date patch was imported into the Application Catalog
- **Groups**—Listing of which groups this patch belongs to. A patch can belong to multiple groups. You can copy a patch into multiple groups.
- **Description**—You can enter a description of the patch in this field.

4. In Application Catalog, you can view additional detailed patch information by right-clicking on a patch on the **Environment** tab and then selecting **Properties** from the shortcut menu. The **Patch Properties** dialog box opens.

The following information is listed:
- **General Tab**—View the title and a summary of a selected patch.
- **Contents Tab**—Lists all of the files and registry data contained in the selected patch.
- **Product Tab**—Lists the products that are updated by the selected patch.

**Viewing Associated Patches**

On the **Associated Patches View**, you can view a list of imported patches that, if installed, would update that product.

<table>
<thead>
<tr>
<th>Task</th>
<th>To view associated patches:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Launch <strong>Application Catalog</strong> and open the <strong>Analyze</strong> tab in the ribbon.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the Windows Installer package that you want to examine. The <strong>Analyze Deployment Type View</strong> for that package opens.</td>
</tr>
<tr>
<td>3.</td>
<td>Expand the product to view its constituent views and select the <strong>Associated Patches</strong> node. The <strong>Associated Patches View</strong> opens, displaying patches associated with that product.</td>
</tr>
<tr>
<td>4.</td>
<td>If you double-click on a patch in the <strong>Associated Patches View</strong>, the <strong>Security Patch View</strong> (on the <strong>Environment</strong> tab) for that patch opens, listing general information on the selected patch.</td>
</tr>
</tbody>
</table>

See **Viewing Patch Content Information** for more information.

**Viewing Patch Impacts on the Products Tab**

The information listed on the **Patch Impact View** depends upon the selection that is made in the **Impact category** list:

- When **Summary** is selected, the patches for which there is patch impact data persisted against the product are listed
- When **File Impacts** is selected, all impacts against this product are listed, and the patch that caused the impact is identified.

<table>
<thead>
<tr>
<th>Task</th>
<th>To view patch impacts:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Launch Application Catalog and open the <strong>Analyze</strong> tab in the ribbon.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the Windows Installer package that you want to examine. The <strong>Analyze Deployment Type View</strong> for that package opens.</td>
</tr>
<tr>
<td>3.</td>
<td>Expand the package to view its constituent views and select the <strong>Patch Impacts</strong> node. The <strong>Patch Impact View</strong> opens.</td>
</tr>
</tbody>
</table>
4. Select **Summary** from the **Impact category** list to view a list of patches for which there is patch impact data persisted against the product.

5. Select **File Impacts** from the **Impact category** list to view a list of all impacts against this product and the patch that caused the impact.

6. If you double-click on one of the patches in the list, the **Patch View** for that patch will open.
   If no patch impacts have been identified for this product, **File Impacts** will not be listed in the **Impact category** list.

7. To perform patch impact analysis, right-click on the product in the product tree on the **Analyze Deployment Type View**, and then select **Launch Impact Analysis Wizard** from the shortcut menu.

---

**Note** • All patch information displayed in Application Catalog comes from the Application Catalog (for imported patches); no information about patches from mssecure.xml file is displayed in Application Catalog.

Performing Patch Impact Analysis
Generating the Patch Report

---

**Generating the Patch Report**

**AdminStudio 2019 | Application Manager**

**Edition** • Support for importing Microsoft Security Patch files and the Patch Impact Analysis Wizard are included with AdminStudio Enterprise Edition.

In Application Catalog you can generate a Patch Report which lists detailed information about each patch that has been imported into the Application Catalog, including patch impact analysis information.

The Patch Report is generated in Web Archive format (.mht), a single, stand-alone HTML file that can be easily viewed in a Web browser and copied and emailed throughout your organization. The report is also printer-friendly.

**Task**

**To generate a Patch Report:**

1. Launch Application Catalog and click on the **Environment** tab. The **Security Patches Group View** opens.

2. Expand the patch listing and select the patch that you want to generate a report on. The **Security Patch View** opens.

3. Right-click on the patch and select **Generate Report** from the shortcut menu. The **Save Patch Report As** dialog box opens, prompting you to select a location for the .MHT file.
4. Confirm the report name and location and click **Save**. The report will be generated and will open in a new browser window. Click on the icons to expand or contract that section of the report. The report includes the following sections:

Table 17-3:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Image]</td>
<td>Products Updated</td>
<td>Products updated by the patch.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Files</td>
<td>Files included in the patch.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Registry Entries</td>
<td>Registry entries that are added or modified by the patch.</td>
</tr>
<tr>
<td>![Image]</td>
<td>Impacts</td>
<td>Products that were checked for impacts during Patch Impact Analysis, and impacts that were detected during Patch Impact Analysis.</td>
</tr>
</tbody>
</table>

5. To print the report with all sections expanded, click the **Print Page** icon.

Isolating Applications Using Application Isolation Wizard

Application isolation is one solution to component versioning conflicts. Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested.

Application Isolation Wizard user documentation is presented in the following sections:

Table 18-1 • Application Isolation Wizard User Documentation

About Application Isolation Wizard

AdminStudio 2019 | Application Isolation Wizard

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

Application isolation is one solution to component versioning conflicts, commonly known as “DLL Hell.” Isolation reduces versioning conflicts by modifying an application so it always loads the versions of components—such as DLLs—with which it was originally developed and tested. This is accomplished by providing DLLs and other shared components for specific applications, and placing information traditionally stored in the registry into other files that specify the locations of these isolated components. Application isolation provides increased stability and reliability for applications because they are unaffected by changes caused by installation and ongoing maintenance of other applications on the system.

Depending on the isolation method used in the Application Isolation Wizard, you can partially or totally isolate an application. When using assemblies and manifests to isolate applications for Windows XP systems, the assemblies can be updated following deployment without necessitating application reinstallation.

Reasons to Isolate Applications

You would want to isolate an application if:

- You want to resolve incompatibilities between different versions of shared components.
- You want to reduce the complexity of the installation by storing COM activation data in a manifest instead of the registry.
- You want to insulate the application from changes to shared components.

Tip • Following isolation, you can use the Dynamic Dependency Scanner in InstallShield Editor to verify isolated files are loaded from a different directory.
Chapter 18  Isolating Applications Using Application Isolation Wizard

Isolating Repackaged Setups Using Repackager

AdminStudio 2019 | Application Isolation Wizard

Application Isolation Wizard is a stand-alone tool which accepts a Windows Installer package as input and outputs a new, isolated Windows Installer package. You can also generate an isolated version of a repackaged setup immediately after the build step in Repackager.

If you open a Repackager project and choose the Create an isolated version of the Windows Installer package option on the Repackaged Output View, Repackager builds an isolated version of the Windows Installer package immediately after building the non-isolated version.

Both methods of isolating a package are performed using the same Application Isolation Wizard functionality. However, the Application Isolation Wizard provides a user interface experience that allows the user to extend the initial “dependency scanning” process for identifying file isolation candidates, while in Repackager, you specify your assembly and digital signing isolation options on the Isolation Options dialog box, and then those selections are applied to all isolated packages created by Repackager.

For more information, see Isolating Windows Installer Packages.

Launching the Application Isolation Wizard

AdminStudio 2019 | Application Isolation Wizard

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

To launch the Application Isolation Wizard, perform the following steps.

<table>
<thead>
<tr>
<th>Task</th>
<th>To launch the Application Isolation Wizard:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Launch AdminStudio.</td>
</tr>
<tr>
<td>2.</td>
<td>From the Tools Gallery, click the Application Isolation Wizard icon on the left side.</td>
</tr>
</tbody>
</table>
Isolation Methods

The Application Isolation Wizard launches and you can immediately begin the application isolation process.

Isolation Methods

There are two isolation methods supported by the Application Isolation Wizard™: Manifests and Assemblies and Windows Installer Isolated Components.

Assemblies and Manifests

Application isolation using assemblies and manifests is the recommended isolation method for Windows XP. These assemblies and manifests provide the same end result as Windows Installer isolated components, but keep all information outside of the registry and do not require the components to be installed in the same folder as the application. This reduces the chance of errors after isolation resulting from how the application was written.

Assemblies and manifests only work under the Windows XP operating system.

Windows Installer Isolated Components

Application isolation using Windows Installer isolated components is for Windows 98 SE, Me, and 2000. It can also be used on Windows XP, but using assemblies and manifests is the better solution. The isolated component method copies shared files (typically DLLs) into an application’s folder instead of a shared location. The application then uses these files instead of global ones, preventing modifications made by other applications from affecting the shared files. As a result, the application always uses the versions of these files with which it was deployed.

To instruct an application use the private files rather than shared versions, the Application Isolation Wizard populates the IsolatedComponent table with the necessary logic to use private files stored in the same folder as the application. When Windows Installer performs the setup, data from the IsolatedComponent table populates a .local file, which ultimately directs how to use the private files.

Windows Installer isolated components still require some information to be written to the registry, and also require the associated components to be in the same folder as the application. While in most cases this will still provide required isolation, depending on how the application was written, the movement of these associated components from their original locations may prevent the application from functioning correctly.

Assemblies
Manifests

Assemblies

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.
Assemblies are DLLs or other portable executable files that applications require to function. Under Windows XP, these can be either shared or private. Private assemblies are typically stored in the same directory as the application they support. Shared assemblies are stored in the WinSxS directory, and are digitally signed.

By creating manifests for assemblies, the Application Isolation Wizard™ allows you to create self-contained applications that can use different versions of the same DLL or other portable executable, without any version conflicts.

**Shared Assemblies**

Shared assemblies are assemblies available to multiple applications on a computer. Applications that require these assemblies specify their dependence within a manifest. Multiple versions of shared assemblies can be used by different applications running simultaneously.

These assemblies are stored in the WinSxS directory, and must be digitally signed for authenticity. After deployment, the version of shared assemblies can be changed, allowing for changes in dependencies.

**Private Assemblies**

Private assemblies are assemblies created for exclusive use by an application. They are accompanied by an assembly manifest, which contains information normally stored in the registry. Private assemblies allow you to totally isolate an application, eliminating the possibility that dependent files may be overwritten by other applications.

These assemblies are always stored in the same location as their associated executable.

---

**Manifests**

*AdminStudio 2019 | Application Isolation Wizard*

_Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions._

The Application Isolation Wizard™ can create two types of manifests: application manifests and assembly manifests.

**Table 18-2 • Manifest Types**

<table>
<thead>
<tr>
<th>Manifest Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application</strong></td>
<td>Application manifests are XML files that describe an isolated application. This descriptive information includes the relationship between the application and its dependent files. Typically, the naming convention for a manifest is ApplicationName.Extension.manifest. For example, if the application was HelloWorld.exe, the manifest file is called HelloWorld.exe.manifest.</td>
</tr>
</tbody>
</table>
Manifests as New Components

When you create manifests, the Application Isolation Wizard supports putting them into new components. If you do not select this option from the Advanced Options dialog box, the manifest will be added to the same component as the assembly.

Digital Signatures

Like conventional signatures, digital signatures identify you (or your organization) to end users. In the context of application isolation, a digital signature identifies you or your organization as the creator of shared assemblies. This ensures that the identity of a shared assembly can be verified for authenticity. Digital signatures in the Application Isolation Wizard™ require a combination of a digital certificate and a code signing technology.

Certificates

Digital certificates identify you and/or your company to end users to assure them the assembly they are about to use has not been altered. They are issued by a certification authority such as VeriSign, or created using a combination of software publishing credentials (.spc) and a private key (.pvk), both also issued by a certification authority. The certificate includes the public cryptograph key, and, when used in combination with a private key, can be used by end users to verify the authenticity of the signor.

You can create a certificate file from the constituent PVK and SPC files and import it into the Certificate Store using the PVK Digital Certificate Files Importer. You can then export the certificate (.cer) file for use outside of the certificate store.
Caution • Certificate files must be 2048-bit or higher. For more information, see the article: Assembly Signing Example on the Microsoft Developer Network website.

Digital Signatures

Code Signing Technologies

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

The Application Isolation Wizard™ supports two code signing technologies:

Table 18-3 • Supported Code Signing Technologies

<table>
<thead>
<tr>
<th>Technology</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credentials</td>
<td>Credentials consist of both Software Publishing Credentials (.spc file) and a private key (.pvk file). These two files are required in conjunction with the certificate to sign shared assemblies.</td>
</tr>
<tr>
<td>Certificate Name in the Store</td>
<td>Using Microsoft’s Certificate Store technology, the combined software publishing credentials and private key can be placed in a repository for multiple uses. The name of the certificate is provided as opposed to the constituent files in the Credentials code signing technology.</td>
</tr>
</tbody>
</table>

Digital Signatures

Software Publishing Credentials

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

You must supply a certification authority with specific information about your company and software to obtain software publishing credentials in the form of an .spc file. Your software publishing credentials are used to generate a digital signature for your assembly.

The .spc file and .pvk (private key) file you enter in the Digital Signature tab of the Advanced Options dialog box compose the digital certificate for shared assemblies.

Contact a certification authority such as VeriSign for more information on the specifics of software publishing credentials.
Certificate Store

To perform code signing, both private key and software publishing credential information must be supplied. This must occur each time a package is signed. However, the certificate store serves as a central repository for this information, allowing you to associate the same credentials and key with multiple packages. This simplification is particularly useful when isolating applications, as typically the code signing information will be identical for all shared assemblies. Ultimately, the certificate store removes the burden of managing private key and software publishing credential information.

You can create a certificate file from the constituent PVK and SPC files and import it into the certificate store using the PVK Digital Certificate Files Importer. You can then export the certificate (.cer) file for use outside of the certificate store.

See Also
Introduction to Code Signing (msdn.microsoft.com)

Private Keys

A private key (a file with the extension .pvk) is granted by a certification authority. The Application Isolation Wizard™ uses the private key you enter in the Digital Certificates tab of the Advanced Options dialog box to digitally sign your shared assembly and ensure end users of its content’s authenticity.

The .spc (Software Publishing Credentials) file and .pvk file you enter in the Digital Signature tab compose the digital certificate for shared assemblies.

Contact a certification authority such as VeriSign for more information on the specifics of software publishing credentials.

Isolating Applications

To isolate applications within a Windows Installer package or a merge module, perform the following steps.
Chapter 18  Isolating Applications Using Application Isolation Wizard

Setting Assembly Naming Conventions

**Task**

*To isolate applications within a Windows Installer package (.msi) or merge module (.msm):*

1. Launch the Application Isolation Wizard™. The Welcome Panel appears.
2. From the Welcome Panel, click Next. The Windows Installer File Selection Panel appears.
3. From the Windows Installer File Selection Panel, specify the Windows Installer package (.msi), Windows Installer self-extracting executable file (setup.exe), merge module (.msm) containing applications you want to isolate. Click Next. The Isolation Method panel appears.
4. From the Isolation Method Panel, select the isolation method(s) you want to use.
5. If you are using manifests, you can click Advanced to configure manifest properties and digital signature information (if required) on the Advanced Options Dialog Box.
6. Click Next. The Summary Information Panel appears.
7. From the Summary Information Panel, confirm the isolation selections.
8. If you want to manually configure isolation, click Modify.
   - If you are using manifests to isolate your application—either alone or in conjunction with Windows Installer isolated components—the Manifest and Assembly Design dialog box appears.
   - If you are only using Windows Installer isolated components to isolate the application, the Isolated Components Design dialog box appears. After you have completed manually configuring the isolation, click OK to return to the Summary Information Panel.
   - When the Application Isolation Wizard is complete, the Completing the Application Isolation Wizard Panel is displayed, providing feedback on whether the Application Isolation Wizard was successful.
10. From the Completing the Application Isolation Wizard Panel, click Finish.

**Setting Assembly Naming Conventions**

AdminStudio 2019 | Application Isolation Wizard

*Edition* • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

To set the default naming convention for assemblies, perform the following steps.

**Task**

*To set the default naming convention for assemblies:*

1. Launch the Application Isolation Wizard™. The Welcome Panel opens.
2. From the Welcome panel, click Next. The Windows Installer File Selection Panel opens.
3. From the Windows Installer File Selection panel, specify the Windows Installer package (.msi) or merge module (.msm) containing applications you want to isolate. Click Next. The Isolation Method Panel opens.
4. Select the Use manifests for isolation option.

5. Click Advanced. The Manifest Options tab of the Advanced Options dialog box opens.

6. Enter your Company name and Division. These two fields create the default assembly naming convention (in the form “Company.Division.Assembly” followed by a number).

   Note • To edit the Assembly Name, you can also click Modify from the Summary Information Panel later in the Wizard to open the Manifest and Assembly Design dialog box, and then click Properties to open the Application Manifest Properties dialog box, where you can edit the Assembly Name.

7. Click OK. You are returned to the Isolation Method Panel.

8. Click Next. The Summary Information Panel opens.

9. Click Isolate to proceed with isolation using the specified naming convention.

   Assemblies created during application isolation will follow the naming convention as specified.

Modifying the Default Isolation Recommendations

AdminStudio 2019 | Application Isolation Wizard

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

You can modify default isolation recommendations for the following:

- When Only Using Windows Installer Isolated Components
- When Using Manifests for Isolation

When Only Using Windows Installer Isolated Components

To modify the default isolation recommendations when only using Windows Installer isolated components, perform the following steps.

Task To modify the default isolation recommendations:

1. From the Summary Information Panel of the Application Isolation Wizard™, click Modify. The Isolated Components Design dialog box is displayed.

2. Select the Applications to be Isolated and then select the Files to Isolate for Selected Application. Repeat as necessary.

3. Click OK. When you return to the Summary Information Panel, verify your settings before isolating.

When Using Manifests for Isolation

To modify the default isolation recommendations when using manifests for isolation, perform the following steps.
Task To modify the default isolation recommendations when using manifests for isolation:

1. From the Summary Information Panel of the Application Isolation Wizard, click Modify. The Manifest and Assembly Design dialog box is displayed.

2. If you need to create a new assembly, select the application for which you want to create the assembly, click New, and select the assembly type: Private Assembly or Shared Assembly.

   ![Manifest and Assembly Design dialog box]

   A new assembly is listed under the selected application.

3. Select the new assembly then add or remove files in the assembly.

4. Click OK. When you return to the Summary Information panel, verify your settings before isolating.

Filtering File Listings when Manually Configuring Isolation

Task To filter the file listing when manually configuring application isolation using manifests:

1. In the Manifest and Assembly Design dialog box, select an assembly from the application tree.

2. Directly below the Files to be added in an assembly window, specify the files displayed from the Show filter.

Task To filter the file listing when manually configuring application isolation using Windows Installer isolated components:

1. In the Isolated Components dialog box, select an application from the application tree.

2. Directly below the Files to Isolate for Selected Application window, specify the files displayed from the Show filter.

Servicing Published Shared Assemblies

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.
Shared assemblies can be serviced (altered) after publishing to update them as necessary. This is accomplished using a publisher configuration, which overrides default configurations specified in the manifest.

For an exhaustive discussion of how to service shared assemblies, refer to the article How To Build and Service Isolated Applications and Side-by-Side Assemblies for Windows XP on the Microsoft Developer Network website (msdn.microsoft.com).

Application Isolation Wizard Reference

Welcome Panel

The Welcome panel is the first panel displayed when you launch the Application Isolation Wizard. It provides a general explanation of application isolation.

Click Next to proceed to the Windows Installer File Selection Panel.
Windows Installer File Selection Panel

**AdminStudio 2019 | Application Isolation Wizard**

*Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.*

Enter the full path and file name of the Windows Installer package (.msi) or merge module (.msm) that you want the Application Isolation Wizard to scan for isolation candidates. Alternately, click Browse to navigate to the file.

Click Back to return to the Welcome Panel; click Next to proceed to the Isolation Method Panel.

Isolation Method Panel

**AdminStudio 2019 | Application Isolation Wizard**

*Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.*

Select the application isolation method(s) you want to use for this Windows Installer package or merge module.

Make the following selections under Manifests and Windows Installer Isolated Components:

**Table 18-4 • Isolation Method Panel Selection Guidelines**

<table>
<thead>
<tr>
<th>If Installation Will Be Deployed ...</th>
<th>Manifests</th>
<th>Windows Installer Isolated Components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only on Windows 2003 Server</td>
<td>Select</td>
<td>Do Not Select</td>
</tr>
<tr>
<td>Only on Windows XP</td>
<td>Select</td>
<td>Do Not Select</td>
</tr>
<tr>
<td>Windows 98 SE, Me, and/or Windows 2000 but not XP</td>
<td>Do Not Select</td>
<td>Select</td>
</tr>
<tr>
<td>Windows XP and Windows 98 SE, Me, and/or Windows 2000</td>
<td>Select</td>
<td>Select</td>
</tr>
</tbody>
</table>

*Note • Your installation package size will increase, but application isolation will work on the appropriate operating systems.*

If you use Manifests, click Advanced to display the Advanced Options dialog box, from which you can configure manifest options and digital signature information.
Chapter 18  Isolating Applications Using Application Isolation Wizard

Application Isolation Wizard Reference

Summary Information Panel

From this panel, review a summary of your selections prior to isolation.

For granular control over the isolation process, click Modify. If you are only using Windows Installer Isolated Components as the isolation method, the Isolated Components Design dialog box appears. Otherwise, the Manifest and Assembly Design dialog box is displayed.

Click Back to return to the Isolation Method Panel; click Isolate to isolate the application according to your settings. The Application Isolation Progress panel is displayed.

Application Isolation Progress Panel

During application isolation, the progress is displayed on this panel. Information about the applications, assemblies (if using manifests as the isolation method), and files is displayed above the progress bar.

Upon isolation completion (or failure), the Completing the Application Isolation Wizard Panel is displayed.

Completing the Application Isolation Wizard Panel

The final panel in the Application Isolation Wizard provides feedback on whether the Application Isolation Wizard was successful.

If the Application Isolation Wizard was successful, the names and locations of the original and output packages are provided. If the Wizard was not successful, this panel informs you that the selected components could not be isolated.

Advanced Options Dialog Box

If the Application Isolation Wizard was successful, the names and locations of the original and output packages are provided. If the Wizard was not successful, this panel informs you that the selected components could not be isolated.
The Advanced Options dialog box, available from the Isolation Method and Ready to Isolate panels of the Application Isolation Wizard, allows you to configure assembly types, naming conventions, and digital signature options. The Advanced Options dialog box presents these options on two tabs: Manifest Options and Digital Signature.

Once you have finished configuring advanced options, click OK to save your changes, or Cancel to close the dialog box without saving your modifications. When the dialog box closes, you are returned to the panel where you clicked Advanced.

**Manifest Options Tab**

The Manifest Options tab, available in the Advanced Options dialog box, allows you to configure several settings associated with manifests.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Assembly Type</strong></td>
<td>This option allows you to select the type of assemblies that Application Isolation Wizard™ will create and use:</td>
</tr>
<tr>
<td></td>
<td>• Create private side-by-side assemblies in the application folder</td>
</tr>
<tr>
<td></td>
<td>• Create shared side-by-side assemblies in the WinSxS folder (Default)</td>
</tr>
<tr>
<td></td>
<td>If you want to use both assembly types, you need to manually configure assemblies from the Manifest and Assembly Design Dialog Box.</td>
</tr>
<tr>
<td><strong>Assembly Naming Conventions</strong></td>
<td>Specify your company and division information to define the default naming convention that Application Isolation Wizard will use when creating assemblies during application isolation</td>
</tr>
<tr>
<td></td>
<td>By default, assembly names are specified in the form of:</td>
</tr>
<tr>
<td></td>
<td>Company.Division.Assembly</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Manifests for shared assemblies must be digitally signed. This can be done in the Digital Signature Tab.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>A 2048-bit key is required to sign a Windows XP assembly/manifest being installed to the WinSxS folder.</td>
</tr>
</tbody>
</table>
Digital Signature Tab

The Digital Signature tab, available in the Advanced Options dialog box, allows you to configure the certificate information required when using shared assemblies. This required digital signature provides an extra layer of protection, allowing you to obtain information about the company who created a global assembly.

**Caution** • *The Application Isolation Wizard™ uses timestamping when signing global assemblies. Consequently, you must have an Internet connection on the computer when you create a global assembly.*

You must configure the following options when signing these assemblies:

**Table 18-6 • Digital Signature Tab Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate File</td>
<td>Click the Browse button next to the field and navigate to the certificate file you are using to sign assemblies. A digital certificate identifies you and/or your company to end users and assures them the data they are about to receive has not been altered.</td>
</tr>
</tbody>
</table>
A 2048-bit key is required to sign a Windows XP assembly/manifest being installed to the WinSxS folder.

**Table 18-6 • Digital Signature Tab Options**

<table>

</tr>
<tr>
<td><strong>Note</strong></td>
<td>A 2048-bit key is required to sign a Windows XP assembly/manifest being installed to the WinSxS folder.</td>
</tr>
</tbody>
</table>

**Manifest and Assembly Design Dialog Box**

If you are using manifests to isolate your application, either alone or in conjunction with Windows Installer isolated components, the Manifest and Assembly design dialog box is displayed when you click Modify from the Summary Information panel.

When you first display this dialog box, the settings the Application Isolation Wizard™ recommends for this package are displayed. By default, only executables that will be installed in the SystemFolder will be selected for isolation. You can select an application contained in the Windows Installer or merge module and create a new private or shared assembly for that application. You can then select the files to isolate for the selected application. A filter at the bottom of the dialog box allows you to restrict the file types visible.

Click Properties to display the **Application Manifest Properties** dialog box. From this dialog box, you can configure the naming convention for assemblies and manifests, and specify whether you want manifests placed into separate components.

When you have finished performing manual configuration, click OK to return to the Summary Information panel.
Isolated Components Design Dialog Box

AdminStudio 2019 | Application Isolation Wizard

**Edition** • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

If you are only using Windows Installer isolated components to isolate the application, this dialog box is displayed when you click Modify from the Summary Information panel.

When you first display this dialog box, the settings the Application Isolation Wizard™ recommends for this package are displayed. By default, only libraries that will be installed in the SystemFolder will be selected for isolation. You can select an application contained in the Windows Installer or merge module, and then select the files to isolate for the selected application. A filter at the bottom of the dialog box allows you to restrict the file types visible.

When you have finished performing manual configuration, click OK to return to the Summary Information panel.

Assembly Properties Dialog Box

AdminStudio 2019 | Application Isolation Wizard

**Edition** • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

The Assembly Properties dialog box displays information about the manifest and assembly, and can be launched from the Manifest and Assembly Design dialog by selecting an assembly and clicking Properties.

The following groups contain configurable options:

**Table 18-7 • Assembly Properties Dialog Box Options**

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manifest Details</td>
<td>In the Manifest Details group, you can view the file name for the manifest. It is structured in the form &quot;Company.Division.Assembly.manifest&quot; by default.</td>
</tr>
<tr>
<td>Assembly Identity</td>
<td>The Assembly Identity group contains fields for the Assembly Name and Version. When you change the assembly name, the manifest file name changes.</td>
</tr>
<tr>
<td>Assembly Type</td>
<td>This group allows you to select whether the current assembly is private or shared. If it is shared, you must configure digital signature information in the Advanced Options dialog box.</td>
</tr>
</tbody>
</table>
Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

The Application Manifest Properties dialog box displays information about the manifest and assembly, and can be launched from the Manifest and Assembly Design dialog by selecting an application and clicking Properties.

The following groups contain configurable options:

Table 18-8 • Application Manifest Properties Dialog Box Options

<table>
<thead>
<tr>
<th>Options Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manifest Details</td>
<td>In the Manifest Details group, you can view the file name for the manifest. It is structured in the form “Company.Division.Assembly.manifest” by default.</td>
</tr>
<tr>
<td>Assembly Identity</td>
<td>The Assembly Identity group contains fields for the Assembly Name and Version. When you change the assembly name, the manifest file name changes.</td>
</tr>
</tbody>
</table>

Command-Line Options

Edition • Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.

Create new component
Select this option if you want to create a new component for this assembly.

Caution • If this assembly contains files that originate from multiple components, this option must be selected for successful application isolation.

If you are planning to deploy this isolated package to operating systems prior to Windows XP, always check this box.

This check box applies only to this assembly. Global settings for assemblies can be configured from the Manifest Options tab of the Advanced Options dialog box.
The Application Isolation Wizard can also be run from the command line. You can specify the following options when running the AIW.exe executable from the command line:

### Table 18-9 • Application Isolation Wizard Command-Line Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-?</code></td>
<td>Displays command-line help for the Application Isolation Wizard.</td>
</tr>
<tr>
<td><code>-version</code></td>
<td>Displays the version of AdminStudio.</td>
</tr>
<tr>
<td><code>-i &lt;configuration file&gt;</code></td>
<td>Allows you to specify a configuration file for Application Isolation Wizard settings. The default file, AIWConfig.ini, is located in &lt;AdminStudio Directory&gt;\Common and can be used as a model. This parameter is optional.</td>
</tr>
<tr>
<td><code>-p &lt;package name&gt;</code></td>
<td>The name and location of the package or merge module which includes applications you want to isolate. This parameter is mandatory.</td>
</tr>
</tbody>
</table>

### Configuration Files

*AdminStudio 2019 | Application Isolation Wizard*

**Edition** • *Application Isolation Wizard is included with AdminStudio Standard, Professional, and Enterprise Editions.*

When using the command-line options for the Application Isolation Wizard, you can specify an INI file for configuration using the `-i` parameter. This file should take the following format:

```ini
[IsolationMethods]
Manifests=1
IsolatedComponents=1

[DigitalSignature]
CertificateFile=
SPCFile=
PVKFile=
CertificateName=
TimeStampAssemblies=

[Manifest]
AssemblyType=0
Company="Company"
Division="Division"
NewComponents=0
```
Each configuration corresponds to a user interface setting in the Application Isolation Wizard, as described below:

### Table 18-10 • Configuration File Settings

<table>

Ensuring Package Quality Using QualityMonitor

QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

QualityMonitor allows you to run a series of built-in tests to installed Windows Installer-based products, helping to ensure they run correctly. When failures occur, QualityMonitor can help identify where problems exist, and ultimately direct you to the solution.

QualityMonitor user documentation is presented in the following sections:

Table 19-1 • QualityMonitor User Documentation

About QualityMonitor

Prior to deploying a Windows Installer–based application, typically you need to test it in the targeted deployment environment to ensure the application works as expected. However, it is often not feasible (or possible) to test each piece of an application’s functionality, due to the complexity of the application and/or its interface. Behind the scenes, there may be dozens or hundreds of attempts to access files, registry keys, or services; errors may only become apparent in rare and isolated circumstances.

One major source of failure is when the target environment is restricted in some way, such as in a locked-down environment. In this case, there may be prohibitions on certain COM activation or registry access, which ultimately prevents an application from working correctly.

QualityMonitor allows you to run a series of built-in tests to installed Windows Installer-based products, helping to ensure they run correctly. When failures occur, QualityMonitor can help identify where problems exist, and ultimately direct you to the solution.

Creating New QualityMonitor Project Files

You can create a new QualityMonitor project by selecting the create new project option on the welcome to QualityMonitor View.

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.
Chapter 19  Ensuring Package Quality Using QualityMonitor

Opening Existing QualityMonitor Project Files

AdminStudio 2019 | QualityMonitor

QualityMonitor's project files have an .iqm extension and are opened by performing the following steps.

Task  To open an existing QualityMonitor project file (.iqm):

2. Click Open on the File menu. The Open QualityMonitor Project dialog box opens.
3. Select the Open QualityMonitor project (.iqm) file option.
4. Enter or browse to the file you want to open.
5. Click OK.

Working with Test Cases

AdminStudio 2019 | QualityMonitor

Edition  •  QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The primary purpose of QualityMonitor is to serve as a diagnostic tool when applications fail to function correctly in deployment environments. This is accomplished primarily through running Test Cases and individual Test Items, and evaluating the results. Topics in this section cover the most common tasks you may perform when working with Test Cases.

- Running Individual Test Items
- Running Multiple Test Items
- Adding Test Item Comments
Running Individual Test Items

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can choose to run a Deployment Test on an individual Test Item.

<table>
<thead>
<tr>
<th>Task</th>
<th>To run an individual Test Item:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.</td>
</tr>
<tr>
<td>2.</td>
<td>Under Deployment Tests, select one of the following tests to open its corresponding View:</td>
</tr>
<tr>
<td></td>
<td>• Class IDs</td>
</tr>
<tr>
<td></td>
<td>• File Associations</td>
</tr>
<tr>
<td></td>
<td>• Help Files</td>
</tr>
<tr>
<td></td>
<td>• Prog IDs</td>
</tr>
<tr>
<td></td>
<td>• Services</td>
</tr>
<tr>
<td></td>
<td>• Shortcuts</td>
</tr>
<tr>
<td></td>
<td>• Type Libraries</td>
</tr>
<tr>
<td></td>
<td>• ODBC Data Sources</td>
</tr>
<tr>
<td></td>
<td>• ODBC Drivers</td>
</tr>
<tr>
<td>3.</td>
<td>In the Test Items list, select the Test Item you want to run and click the Run button.</td>
</tr>
</tbody>
</table>

Depending on whether the Test Item is automatic or requires opening or launching files, you may need to perform some manual tasks prior to results being returned. When the test is complete, QualityMonitor displays Passed or Failed in the Status column of the selected Test Item.
Running Multiple Test Items

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can choose to run a Deployment Test on a multiple Test Items at once.

<table>
<thead>
<tr>
<th>Task</th>
<th>To run multiple Test Items:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.</td>
</tr>
<tr>
<td>2.</td>
<td>Under Deployment Tests, select one of the following tests to open its corresponding View:</td>
</tr>
<tr>
<td></td>
<td>• Class IDs</td>
</tr>
<tr>
<td></td>
<td>• File Associations</td>
</tr>
<tr>
<td></td>
<td>• Help Files</td>
</tr>
<tr>
<td></td>
<td>• Prog IDs</td>
</tr>
<tr>
<td></td>
<td>• Services</td>
</tr>
<tr>
<td></td>
<td>• Shortcuts</td>
</tr>
<tr>
<td></td>
<td>• Type Libraries</td>
</tr>
<tr>
<td></td>
<td>• ODBC Data Sources</td>
</tr>
<tr>
<td></td>
<td>• ODBC Drivers</td>
</tr>
<tr>
<td>3.</td>
<td>In the Test Items list, select the Test Items you want to run. Multiple selection is supported using the Shift and Ctrl keys.</td>
</tr>
<tr>
<td>4.</td>
<td>To run only the selected Test Items, click the Run button. To run all Test Items, click the Run All button.</td>
</tr>
</tbody>
</table>

Depending on whether the Test Item is automatic or requires opening or launching files, you may need to perform some manual tasks prior to results being returned. When the tests are complete, QualityMonitor displays Passed or Failed in the Status column of the selected Test Items.

Adding Test Item Comments

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can choose to add comments to a Test Item—perhaps to document why it passed or failed, or to note an issue that needs attention.
Task  

To add comments to an individual Test Item:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.

2. Under Deployment Tests, select one of the following tests to open its corresponding View:
   - Class IDs
   - File Associations
   - Help Files
   - Prog IDs
   - Services
   - Shortcuts
   - Type Libraries
   - ODBC Data Sources
   - ODBC Drivers

3. In the Test Items list, right-click the Test Item to which you want to add comments, and select Test Item Information from the shortcut menu. The Test Item Information dialog box appears.

4. Enter comments into the Comments field.

5. When finished, click OK.

Adding Test Case Comments

You can add comments associated with an entire Test Case.

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

Task  

To add comments to a Test Case:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.

2. Under Deployment Tests, select one of the following tests to open its corresponding View:
   - Class IDs
   - File Associations
   - Help Files
   - Prog IDs
3. In the **Comments** box at the top right of the View, enter comments. Your comments are automatically saved.

### Viewing Test Item Details

**AdminStudio 2019 | QualityMonitor**

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

When a Test Item fails, you can view details about it, including the error message associated with it. This information is displayed on the **Test Item Information** dialog box, along with the Test Item name, status, and any comments that have been entered.

<table>
<thead>
<tr>
<th>Task</th>
<th>To view Test Case details:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The <strong>QualityMonitor Product Information View</strong> opens and a view of <strong>Test Items</strong> is displayed.</td>
</tr>
<tr>
<td>2.</td>
<td>Under <strong>Deployment Tests</strong>, select one of the following tests to open its corresponding View:</td>
</tr>
<tr>
<td></td>
<td>• Class IDs</td>
</tr>
<tr>
<td></td>
<td>• File Associations</td>
</tr>
<tr>
<td></td>
<td>• Help Files</td>
</tr>
<tr>
<td></td>
<td>• Prog IDs</td>
</tr>
<tr>
<td></td>
<td>• Services</td>
</tr>
<tr>
<td></td>
<td>• Shortcuts</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>• ODBC Data Sources</td>
</tr>
<tr>
<td></td>
<td>• ODBC Drivers</td>
</tr>
<tr>
<td>3.</td>
<td>Right-click on a <strong>Test Item</strong> and select <strong>Test Item Information</strong> from the shortcut menu. The <strong>Test Item Information</strong> dialog box opens, and the following details are listed:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Test Item</strong>—Name of the selected Test Item.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Status</strong>—Status of the selected Test Item: Passed, Failed, or Pending.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Comments</strong>—Any comments that were previously entered.</td>
</tr>
</tbody>
</table>
• **Test Details**—If this Test Item has Failed, a brief explanation of the reason the Test Item failed the test is listed.

4. When finished viewing test details, click OK to close the dialog box.

### Clearing Test Case Results

**Edition** • *QualityMonitor is included with AdminStudio Professional and Enterprise Editions.*

You can clear Test Case results for all Test Items from a previous Test Case execution.

<table>
<thead>
<tr>
<th>Task</th>
<th>To clear Test Case results (all Test Items) from a previous Test Case execution:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor <strong>Product Information View</strong> opens and a view of <strong>Test Items</strong> is displayed.</td>
</tr>
<tr>
<td>2.</td>
<td>Under <strong>Deployment Tests</strong>, select one of the following tests to open its corresponding View:</td>
</tr>
<tr>
<td></td>
<td>• Class IDs</td>
</tr>
<tr>
<td></td>
<td>• File Associations</td>
</tr>
<tr>
<td></td>
<td>• Help Files</td>
</tr>
<tr>
<td></td>
<td>• Prog IDs</td>
</tr>
<tr>
<td></td>
<td>• Services</td>
</tr>
<tr>
<td></td>
<td>• Shortcuts</td>
</tr>
<tr>
<td></td>
<td>• Type Libraries</td>
</tr>
<tr>
<td></td>
<td>• ODBC Data Sources</td>
</tr>
<tr>
<td></td>
<td>• ODBC Drivers</td>
</tr>
<tr>
<td>3.</td>
<td>Click the <strong>Reset Results</strong> button. When you click <strong>Reset Results</strong>, the status of all Test Items is reset. To reset the status of one individual <strong>Test Item</strong>, right-click that <strong>Test Item</strong>, point to <strong>Set Status</strong> and select <strong>Pending</strong> from the shortcut menu. See Manually Setting Test Case Status.</td>
</tr>
</tbody>
</table>

### Manually Setting Test Case Status

**Edition** • *QualityMonitor is included with AdminStudio Professional and Enterprise Editions.*

Depending on your business practices and standards, you may want to override the status of a Test Case in the View List from its current state. In most cases, this will be setting a Test Case which QualityMonitor has marked as **Failed** (because one or more individual Test Items have failed) to **Passed**.
Task  To manually set the Test Case status:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.

2. Under Deployment Tests, select one of the following tests to open its corresponding View:
   - Class IDs
   - File Associations
   - Help Files
   - Prog IDs
   - Services
   - Shortcuts
   - Type Libraries
   - ODBC Data Sources
   - ODBC Drivers

3. In the Test Case Status area, change the status to the desired state by selecting Pending, Passed, or Failed.

Manually Setting Test Item Status

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can manually set the status of an individual Test Item to Passed, Failed, or Pending.

Task  To manually set the status of an individual Test Item:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.

2. Under Deployment Tests, select one of the following tests to open its corresponding View:
   - Class IDs
   - File Associations
   - Help Files
   - Prog IDs
   - Services
   - Shortcuts
   - Type Libraries
• ODBC Data Sources
• ODBC Drivers

3. Right-click on the Test Item, point to Set Status, and select the status from the Set Status submenu: All, Pending, Passed, or Failed.

Filtering Test Case Data

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

On the Product Information View, you can choose to display only those Test Cases with a selected status: Pending, Passed, or Failed.

Task To filter the displayed data in a Test Case:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens and a view of Test Items is displayed.

2. Under Deployment Tests, select one of the following tests to open its corresponding View:
   • Class IDs
   • File Associations
   • Help Files
   • Prog IDs
   • Services
   • Shortcuts
   • Type Libraries
   • ODBC Data Sources
   • ODBC Drivers

3. From the View these test items list, select the filter you want to apply to the data: All, Passed, Failed, or Pending.
   The View is automatically updated based on the selected filter.

Deployment Testing

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.
Deployment tests are performed against the installed product, ensuring that the product has been installed correctly and all key functionality works in the installed environment. Test Cases in this area are primarily designed to identify whether the application fails to work properly due to permission settings on the registry or individual files.

Some of the primary areas checked are:

Table 19-2 • Areas Checked During Deployment Testing

<table>
<thead>
<tr>
<th>Area</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COM Data</td>
<td>Ensure all COM objects can be instantiated programatically. This includes Class IDs, Prog IDs, and Type Libraries. COM data is tested silently, returning results in the Test Case Progress area and the queue. See Checking Class IDs. Checking Prog IDs, or Checking Type Libraries.</td>
</tr>
<tr>
<td>File Associations</td>
<td>Ensure all file extensions have been installed and associated correctly. This involves launching a file with this extension, and determining if the correct application was used. See Checking File Associations.</td>
</tr>

<td>Ensure all NT Services have been installed correctly. This is done by opening the Services Manager to determine if the Service exists on the target machine. See Checking Services.</td>
</tr>
</tbody>
</table>

**Automatically Running All Deployment Tests Silently**

You can choose to run all deployment tests silently (without prompting for user input) using either the Interface or the command line.

**From the Interface**

You can choose to run all deployment tests silently (without prompting for user input) by making a selection in the QualityMonitor interface.
To run all deployment tests silently from the Interface, do one of the following:

1. On the QualityMonitor **Product Information View**, select the **Deployment Tests** root node and then do one of the following:
   - Click the **Execute All Deployment Tests** button.
   - Select **All Deployment Tests** from the **Execute** menu.
   - Click the **Execute All Deployment Tests** toolbar button:

   When you select one of these options, a dialog box with a progress bar and an option to cancel will be displayed.

**From the Command Line**

You can also run all deployment tests silently by entering a command in the command line. See Running QualityMonitor from the Command Line for more information.

**Checking Class IDs**

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The **Class ID** Deployment Test is run to determine if the Class ID COM objects can be instantiated programatically. COM data is tested silently, returning results in the **Test Case Progress** area and the queue.

**Task**

To check Class ID functionality:

1. Create or open a QualityMonitor project. The QualityMonitor **Product Information View** opens.
2. Expand the **Deployment Tests** node and select **Class IDs**. The **Class IDs View** opens.
3. Right-click on the **Test Item** you want to run and select **Run** from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click **Run All** to run all available Test Items.
4. When testing is finished, results are listed in the **Test Case Progress** area.

**Note** • When a Test Item is failed, you can view details about it, including the error message associated with it on the **Test Item Information** dialog box. To access this dialog box, right-click on the Test Item and then select **Test Item Information** from the shortcut menu.
Checking File Associations

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The File Associations Deployment Test is run to determine if all file extensions have been installed and associated correctly. This involves launching a file with this extension, and determining if the correct application was used.

Task  To test file associations:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.
2. Expand the Deployment Tests node and select File Associations from the View List. The File Associations View opens.
3. Right-click on the Test Item you want to run and select Run. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.
4. When the Test Progress dialog box opens, click Run to exercise the file association.
5. From the resulting Open dialog box, browse to a file with the appropriate extension and click Open. The file is launched with its associated application. Following the application launch, the Test Result dialog box appears.
6. Click Yes or No depending on whether the file launched with the expected program. You can also enter comments in the Comment field on this dialog box.

Checking Help Files

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Help Files Deployment Test is run to determine if the help files are installed and can be launched correctly.

Task  To test help file functionality:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.
2. Expand the Deployment Tests node and select Help Files from the View List. The Help Files View opens.
3. Right-click on the Test Item you want to run and select Run from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.
4. When the Test Progress dialog box opens, click Run to launch the help file. Following an attempt to launch the shortcut, the Test Result dialog box appears.
5. Click Yes or No depending on whether the help file launched correctly. You can also enter comments in the Comment field on this dialog box.
## Checking Prog IDs

The `Prog IDs` Deployment Test is run to determine if the Prog ID COM objects can be instantiated programatically. COM data is tested silently, returning results in the **Test Case Progress** area and the queue.

### Task

**To check Prog ID functionality:**

1. Create or open a QualityMonitor project. The QualityMonitor **Product Information View** opens.
2. Expand the **Deployment Tests** node and select **Prog IDs** from the View List. The **Prog IDs View** opens.
3. Right-click on the **Test Item** you want to run and select **Run** from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click **Run All** to run all available Test Items.
4. When testing is finished, results are recorded in the **Test Case Progress** area.

### Note

- When a Test Item is failed, you can view details about it, including the error message associated with it on the **Test Item Information** dialog box. To access this dialog box, right-click on the Test Item and then select **Test Item Information** from the shortcut menu.

## Checking Services

The `Services` Deployment Test is run to determine if all NT Services have been installed correctly. This is done by opening the Services Manager to determine if the Service exists on the target machine.

### Task

**To check Service functionality:**

1. Create or open a QualityMonitor project. The QualityMonitor **Product Information View** opens.
2. Expand the **Deployment Tests** node and select **Services** from the View List. The **Services View** opens.
3. Right-click on the **Test Item** you want to run and select **Run** from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click **Run All** to run all available Test Items.
4. When testing is finished, results are recorded in the **Test Case Progress** area.
Chapter 19  Ensuring Package Quality Using QualityMonitor
Deployment Testing

**Note** • When a Test Item is failed, you can view details about it, including the error message associated with it on the Test Item Information dialog box. To access this dialog box, right-click on the Test Item and then select Test Item Information from the shortcut menu.

### Checking Shortcuts

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Shortcuts Deployment Test is run to determine if each shortcut is installed and if it successfully launches the shortcut target.

<table>
<thead>
<tr>
<th>Task</th>
<th>To check shortcuts:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Expand the Deployment Tests node and select Shortcuts from the View List. The Shortcuts View opens.</td>
</tr>
<tr>
<td>3.</td>
<td>Right-click on the Test Item you want to run and select Run from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.</td>
</tr>
<tr>
<td>4.</td>
<td>When the Test Progress dialog box opens, click Run to launch the shortcut. The Test Result dialog box opens.</td>
</tr>
<tr>
<td>5.</td>
<td>Following an attempt to launch the shortcut, the Test Result dialog box opens. Click Yes or No depending on whether the shortcut launched correctly. You can also enter comments in the Comment field on this dialog box.</td>
</tr>
</tbody>
</table>

### Checking Type Libraries

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Type Libraries Deployment Test is run to determine if the Type Libraries COM objects can be instantiated programatically. COM data is tested silently, returning results in the Test Case Progress area and the queue.

<table>
<thead>
<tr>
<th>Task</th>
<th>To check type library functionality:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Expand the Deployment Tests node and select Type Libraries from the View List. The Type Libraries View opens.</td>
</tr>
<tr>
<td>3.</td>
<td>Right-click on the Test Item you want to run and select Run from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.</td>
</tr>
<tr>
<td>4.</td>
<td>When testing is finished, results are recorded in the Test Case Progress area.</td>
</tr>
</tbody>
</table>
Note • When a Test Item is failed, you can view details about it, including the error message associated with it on the Test Item Information dialog box. To access this dialog box, right-click on the Test Item and then select Test Item Information from the shortcut menu.

Checking Manifests

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Manifests Deployment Test is run to test the manifests and assemblies used to isolate a Windows Installer package. The Manifests Deployment Test tests information from the MsiAssembly and MsiAssemblyName tables. QualityMonitor reads through the manifest/assembly files and performs the baseline Class IDs, Prog IDs, or Type Libraries testing for each entry in the files.

To check shortcuts:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.

2. Expand the Deployment Tests node and select Manifests from the View List. The Manifests View opens.

3. Right-click on the Test Item you want to run and select Run from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.

When testing is finished, results are recorded in the Test Case Progress area. Also, the Status of each test item (Passed, Failed, or Pending) is listed next to the Manifest File name.
Checking ODBC Data Sources

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The ODBC Data Sources Deployment Test is run to verify ODBC data sources.

<table>
<thead>
<tr>
<th>Task</th>
<th>To check ODBC data sources:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Expand the Deployment Tests node and select ODBC Data Sources from the View List. A list of data sources in that application appears in the lower portion of the ODBC Data Sources View. Only those data sources that belong to the current logged-in user are listed on the ODBC Data Sources View.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the Test Item you want to run and click Run. You can also select multiple Test Items to run, or click Run All to run all available Test Items. For certain ODBC data sources, additional connection information is required for verification. When the tests are run in Full user interface mode, additional dialog boxes may be displayed during the test to take more input. However, when the tests are run in Silent user interface mode, these additional dialog boxes will not be displayed and results will be based on default information.</td>
</tr>
<tr>
<td>4.</td>
<td>When testing is finished, results are recorded in the Test Case Progress area.</td>
</tr>
</tbody>
</table>

Note • When a Test Item is failed, you can view details about it, including the error message associated with it on the Test Item Information dialog box. To access this dialog box, right-click on the Test Item and then select Test Item Information from the shortcut menu.

Checking ODBC Drivers

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The ODBC Drivers Deployment Test is run to verify ODBC Drivers.
**Task**

**To check ODBC drivers:**

1. Create or open a QualityMonitor project. The QualityMonitor **Product Information View** opens.

2. Expand the **Deployment Tests** node and select **ODBC Drivers** from the View List. A list of drivers in that application appears in the lower portion of the **ODBC Drivers View**. Only those drivers that belong to the current logged-in user are listed.

3. Select the Test Item you want to run and click **Run**. You can also select multiple Test Items to run, or click Run All to run all available Test Items.

   For certain ODBC drivers, additional connection information is required for verification. When the tests are run in Full user interface mode, additional dialog boxes may be displayed during the test to take more input. However, when the tests are run in Silent user interface mode, these additional dialog boxes will not be displayed and results will be based on default information.

4. When testing is finished, results are recorded in the **Test Case Progress** area.

   **Note** • When a Test Item is failed, you can view details about it, including the error message associated with it on the **Test Item Information** dialog box. To access this dialog box, right-click on the Test Item and then select **Test Item Information** from the shortcut menu.

---

### Specifying Exclusions for Deployment Testing

**AdminStudio 2019 | QualityMonitor**

When a deployment test is run on a package, some of the tests related to Class IDs, Prog IDs, and Type Library IDs fail because they refer to components which belong to the operating system rather than the software which is being tested. These errors have no impact on the integrity of the software being tested, and cause confusion among some users testing the software. Users need to be able to prevent error messages caused by files that are not affecting the performance of the software package to be listed in the test results.

To prevent these operating systems errors from being reported, you can specify a list of files to be excluded when any of the Class ID, Prog ID, or Type Library ID Deployment tests are run. You can maintain a different list for each of these three Deployment Tests.

**Note** • After a Deployment Test has been run, the test results are listed in the **Class IDs View**, **Prog IDs View**, or **Type Libraries View**. The items included in the exclusion lists are not shown in these views, but are still stored in the QualityMonitor Project File (.iqm). When this project file is opened again in QualityMonitor, the results are checked against the exclusion list before being displayed in the **Class IDs View**, **Prog IDs View**, or **Type Libraries View**.

### To Add a File to the Exclusion List

On the **Exclusions** tab of the Options Dialog Box, you can manage all three exclusion lists. On the **Exclusions** tab, you can view the exclusion lists, and can add or remove entries from a list.
Using the Options Dialog Box

**Task**

*To exclude Class IDs, Prog IDs, or Type Library IDs using the Options dialog box:*

1. From the QualityMonitor interface, select **Options** on the **Tools** menu. The **Options** dialog box opens.
2. Click the **Exclusions** tab. On the **Exclusions** tab, excluded items are listed for the selected **Exclusions list**.
3. From the **Exclusions list**, select the Deployment Test that you want to modify the exclusion list for: **Class ID**, **Prog ID**, or **Type Library**.
4. Click **Add**. The **Add Exclusions** dialog box opens.
5. Next to the **File Name** box, click **Browse** and select the **Application (.exe)**, **Application Extension (.dll)**, **Type Library (.tlb)**, or **ActiveX object (.ocx)** file that contains Class IDs, Prog IDs, or Type Library IDs that you want to exclude from the selected Deployment Test.
   
   The Class IDs, Prog IDs, or Type Library IDs that are associated with the selected file are listed, displaying the **Identifier** and a **Description** of each.
6. Select the Class IDs, Prog IDs, or Type Library IDs that you want to exclude from the Deployment Test and click **OK**.

**Directly From the Results Window**

After a Deployment Test has been run and the test results are listed in the **Class IDs View**, **Prog IDs View**, or **Type Libraries View**, you can add an item to the exclusion list directly by right-clicking on the item you want to exclude and choosing **Add to exclusion** from the shortcut menu.

**Figure 19-1:** Adding a Prog ID to the Prog ID Exclusion List from the Test Results List

### Deleting a Item from an Exclusion List

To delete an item from an exclusion list, perform the following steps.

**Task**

*To delete a Class IDs, Prog IDs, or Type Library IDs from an exclusion list:*

1. From the QualityMonitor interface, select **Options** on the **Tools** menu. The **Options** dialog box opens.
2. Click the **Exclusions** tab. On the **Exclusions** tab, excluded items are listed for the selected **Exclusions list**.
3. From the **Exclusions list**, select the Deployment Test that you want to modify the exclusion list for: **Class ID**, **Prog ID**, or **Type Library**.
4. Select the item that you want to delete from the list and click **Remove**. The item is removed from the list.

**Selecting the Default Exclusion List**

On the **General** Tab of the **Options** dialog box, you can select the default **Exclusion file** to use to filter the test results in the **Lockdown and Runtime Tests** views. By selecting an exclusion file from a shared location, multiple people can use the same error exclusion settings.

---

**Lockdown and Runtime Testing**

**AdminStudio 2019 | QualityMonitor**

---

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

Lockdown and runtime tests are available through the **Lockdown and Runtime Tests View**. You are provided with a list of available shortcuts in the package and all of the executables in the package. You can then launch via the shortcut or executable, and exercise functionality in the application. When you close the application, information about the executable is listed under the **Runtime Checks** node. This information, grouped into **Files**, **Registry Entries**, and **Folders** views, allows you to see failures in the application execution. These are potential issues with the application, and may or may not have any affect on the overall package integrity.

If you want to execute tests in the context of a different user (under a different user account), click **Run As** instead of **Run** to execute the test. You would then be prompted to enter a **User Name** and **Password**. For more information, see **Performing Lockdown and Runtime Tests Under a Different User Account**.

This section includes the following topics:

- Performing Lockdown and Runtime Tests
- Performing Lockdown and Runtime Tests Under a Different User Account
- Running Lockdown and Runtime Tests in Restricted Environments
- Performing Isolation Tests
- Filtering Results of Lockdown and Runtime Tests

---

**Note** • Lockdown and runtime tests are only supported on Windows NT4, 2000, and XP.

---

**Performing Lockdown and Runtime Tests**

**AdminStudio 2019 | QualityMonitor**

---

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

Lockdown and Runtime Tests allow you to see failures in the application execution. These are potential issues with the application, and may or may not have any affect on the overall package integrity.
Task

To perform lockdown and runtime tests:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.
2. From the View List, select Lockdown and Runtime Tests. The Lockdown and Runtime Tests View opens.
3. Select either the Select a Shortcut or Select an Executable option.
4. Select the shortcut or executable to run.
5. Click Run.
6. When the application launches, use the application in a normal way, performing various operations.
7. Exit the application.

The name of the executable or shortcut is now listed as a new node under the Lockdown and Runtime Tests node in the View List, and a subnode is listed for any access failures for Files, Folders, or Registry Entries.

8. Select the Files, Folders, and Registry Entries nodes. The right side of the Lockdown and Runtime Tests View displays a list of failed Test Items for each node. For information on specifying which errors are listed, see Filtering Results of Lockdown and Runtime Tests.

9. To view the error message for a Test Item, right-click the Test Item and select Test Item Information on the shortcut menu. The Test Item Information dialog box opens, listing an Error Description in the Test Details area.

Performing Lockdown and Runtime Tests Under a Different User Account

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can use the Run As feature to execute Lockdown and Runtime tests in the context of a different user. This allows you to validate an application in a locked-down environment without actually requiring a user to log-in with a different set of credentials. This will reduce the test cycle effort significantly.
Task

To perform tests under a different user account:

1. Create or open a QualityMonitor project. The QualityMonitor **Product Information View** opens.
2. From the View List, select **Lockdown and Runtime Tests**. The **Lockdown and Runtime Tests View** opens.
3. Select either the **Select a Shortcut** or **Select an Executable** option.
4. Select the shortcut or executable to run.
5. Click **Run As**.

You are then prompted to enter a **User Name** and **Password**.

6. Enter the User Name in the format of: **DOMAINNAME\UserName**. The default value is the current **User Name**.
7. When the application launches, use the application in a normal way, performing various operations.
8. Exit the application.

The name of the executable or shortcut is now listed as a new node under the **Lockdown and Runtime Tests** node in the View List, and a subnode is listed for any access failures for **Files**, **Folders**, or **Registry Entries**.

9. Select the **Files**, **Folders**, and **Registry Entries** nodes. The right side of the **Lockdown and Runtime Tests View** displays a list of failed **Test Items** for each node. For information on specifying which errors are listed, see Filtering Results of Lockdown and Runtime Tests.

10. To view the error message for a **Test Item**, right-click the Test Item and select **Test Item Information** on the shortcut menu. The Test Item Information dialog box opens, listing an **Error Description** in the **Test Details** area.

**Note** • **Run As** can also be selected using the Shift+F5 shortcut, or by selecting **Run As** from the **Execute** menu.

**See Also**

Running Lockdown and Runtime Tests in Restricted Environments

---

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

When executing runtime tests in a locked-down environment, you may encounter an error such as:

Unable to monitor the application execution.

QualityMonitor needs to run under a user with Admin privileges when executing Lockdown and Runtime Tests.

To emulate lockdown environment under a restricted user, click **Run As** instead of **Run** to execute the test, and provide the **User Name** and **Password** of a locked down user. For more information, see **Performing Lockdown and Runtime Tests Under a Different User Account**.

---

Performing Isolation Tests

---

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

You can run Isolation Tests to display the location of all portable executable (PE) files (dll/ocx/exe/tlb/olb) that are launched from a process while performing a Lockdown and Runtime test. Viewing a listing of these portable executable file names and paths makes it easier for you to ensure that the application is fully isolated.

After you perform a Lockdown and Runtime Test for an executable (.exe) or a shortcut on the Lockdown and Runtime Tests View, an additional node called **Isolation Tests** is added to the tree under the executable or shortcut node.

When you select this **Isolation Tests** node, the filenames of the portable executable files and their paths are listed. By default, the status of all these items is **Pending**. To ensure that all of the executables or shortcuts in this test case are isolated, go to the **Test Case Status** area of the view, and set the status of the entire test case to either **Pending**, **Passed**, or **Failed**.

---

**Note** • Note the following regarding Isolation testing:

- The Isolation Tests node will be added to the Lockdown and Runtime Tests tree only if the selected executable launches at least one portable executable file.
- You can specify when you would like the Isolation Tests node to appear in the Lockdown and Runtime Tests tree by selecting an option from the **Show isolation Tests** list on the **General** tab of the **Options Dialog Box**.
- QualityMonitor does not support isolation testing under Windows 2000.
Task To perform isolation tests:

1. Create or open a QualityMonitor project. The QualityMonitor Product Information View opens.

2. From the View List, select Lockdown and Runtime Tests. The Lockdown and Runtime Tests View opens.

3. Select either the Select a Shortcut or Select an Executable option.

4. Select the shortcut or executable to run.

5. Click Run.

After a Lockdown/Runtime test is performed for an executable (.exe) or a shortcut, an additional node called Isolation Tests is added to the tree under the executable or shortcut node.

6. Select the Isolation Tests node. The filenames of the portable executable files and their paths is displayed in the list control of the view. By default, the status of all of the items in this test case is Pending.

7. To ensure that all of the executables or shortcuts in this test case are isolated, go to the Test Case Status area of the view, and set the status of the entire test case to either Pending, Passed, or Failed.

Filtering Results of Lockdown and Runtime Tests

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

On the Lockdown and Runtime Tests Files View, Folders View, Registry Entries View, and Isolation Tests View you can choose to filter the results that are listed.

Task To filter test results:

1. To filter the list by Test Item status, select an option from the View these test items list: Passed, Failed, Pending, or All.

2. To select errors to exclude from future Lockdown and Runtime result listings, perform the following steps:

   a. Click the Set Filter button. The Runtime Test Filters Dialog Box opens, listing all errors that were generated during this test.

   b. Select those errors that you want to exclude from future Lockdown and Runtime tests.
These settings are stored in the default exclusion list (the Exclusion file selected on the General Tab of the Options dialog box), but no changes are made to the Project file. This filter is based on the error code associated with an error, and these error codes are stored in the default exclusion list.

3. To filter the list by one type of error that was generated, make a selection from the Having these errors list. This list includes all the unique errors that were generated when this Test Case was executed (excluding the errors that were filtered out using the Set Filters function). To see all the errors, select Show All.

Using MSI Doctor to Verify Package Deployment Status

You can use QualityMonitor’s MSI Doctor to verify if an MSI package is installed properly. This helps prevent users from seeing an auto-repair dialog box when they run the application. Auto repair messages are displayed by applications to attempt to reinstall missing/corrupted components.

By examining an application using QualityMonitor MSI Doctor, you can quickly identify any problems by checking the status of all products and features. Using MSI Doctor, you can:

- See the status of all components
- Verify if any files are missing or if any files do not match the version or size specified in the MSI file
- See the components status segregated by features
- Configure or reinstall features
- Reinstall components

To use MSI Doctor, select the Deployment Status node ( ) from the QualityMonitor View List to access the Deployment Status View. Under the Deployment Status node, a tree view of the application’s features are components are listed:

![Figure 19-2: Deployment Status View: Features and Components](image)
The following icons are displayed in the tree view and in the component list and indicate the feature or component’s status:

**Table 19-3 • Deployment Status View Icons**

Using MSI Doctor, you can perform the following tasks:

- View Product, Feature, or Component Deployment Status Properties
- Verify Product, Feature, or Component Data
- Install or Configure Products or Features
- Reinstall Features

**See Also**
Deployment Status View
View Product, Feature, or Component Deployment Status Properties

To view the deployment status properties of a product, feature, or component, perform the following steps.

**Task**

1. Launch QualityMonitor and open the package that you want to view the deployment status properties of. The QualityMonitor Product Information View opens.

2. Select one of the following:
   - To view Product properties—Select the Deployment Status icon from the View List.
   - To view Feature properties—Select a Feature icon under the Deployment Status icon on the View List.
   - To view Component properties—Select either the Deployment Status icon or a Feature icon from the View list, and then select a Component from the list on the right.

3. Select Properties from the shortcut menu. The Product Properties, Feature Properties, or Component Properties dialog box appears, displaying property information for the selected Product, Feature, or Component.

4. On the Properties dialog boxes, you can also click the Verify Data button to verify if the files and registry information for the selected item are installed properly. See Verify Product, Feature, or Component Data for more information.

5. Click OK to exit the Properties dialog box.

**Note**

To save all the deployment status information in the QualityMonitor project file (.iqm), select the Save deployment status information when saving project option on the Options Dialog Box.

Verify Product, Feature, or Component Data

You can verify if the files and registry information for a Product, Feature, or Component are installed properly. Verification errors are displayed on the Installed Data Dialog Box.
To verify product, feature, or component data:

1. Launch QualityMonitor and open the package that you want to verify the files of. The QualityMonitor Product Information View opens.

2. Select one of the following:
   - To verify all of the files in all of the Features in the Product, select Deployment Status from the View List.
   - To verify only the files in the selected Feature, select a Feature icon under Deployment Status on the View List.
   - To verify only the files in a specific Component of a Feature, select either the Deployment Status icon in the View List or a Feature icon under it, and then select a component from the list on the right.

4. Click Verify Data. When you click Verify Data, QualityMonitor checks all of the files and registry entries included in the Product, Feature, or Component and then displays them on the Files and Registry tabs of the Installed Data dialog box.

   - On the Files tab, the following icons are used to identify verification errors:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![File icon]</td>
<td>File is missing.</td>
</tr>
<tr>
<td>![File icon]</td>
<td>File has a different version or size than that specified in the Windows Installer package</td>
</tr>
</tbody>
</table>

   - On the Registry tab, all registry entries for the selected item are listed. Registry data is verified by checking the existence of the registry key and the value name (if one exists). (The value data is not checked.) The icon is used to indicate that a registry key or value name is incorrect or missing:

5. Click Close to exit the Installed Data dialog box, and click OK to exit the Properties dialog box.

Note • To save all the deployment status information in the QualityMonitor project file (.iqm), select the Save deployment status information when saving project option on the Options Dialog Box.

Creating Custom Test Cases

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

QualityMonitor supports adding additional, custom Test Cases to projects—based on your business needs.

You can define a template that includes information that is re-used when defining Test Cases. Then, when creating a new user-defined Test Case, you can load this template file and have the components of the new Test Case pre-populated with the information saved in the template. A single template file can load multiple user defined Test Cases.

Adding User-Defined Test Cases

Task

To add a user-defined case:

1. Launch QualityMonitor and open the package that you want to create a custom Test Case for. The QualityMonitor Product Information View opens.
2. Right-click on the User-Defined Tests node and select Add Test Case from the shortcut menu.
   A new Test Case appears below the User Defined Tests node, and you are prompted to enter a name.
3. Name the Test Case appropriately.
4. Select the new Test Case to open the Test Case View.
5. Under Test Case Status, specify the status for this Test Case: Pending, Passed, or Failed.
6. Click Browse and select an executable to associate with this Test Case, if necessary.

7. In the Instructions text box, enter any necessary comments.
   For example, you may want to create a custom Test Case to ensure that a specific database is updated properly after running an application.

8. Your entries are automatically saved in the new Test Case.

Creating and Using Test Case Templates

Task

To create and use Test Case templates:

1. Create a new Test Case as described in Adding User-Defined Test Cases.

2. To save the Test Case as a template to re-use when creating new Test Cases, perform the following steps:
   a. Right-click on this Test Case node in the User Defined Tests tree and select Save as template from the shortcut menu.
   b. Specify a name and a location for the Test Case template and select Save. The template is saved in .xml format in the location you specify.

3. To add this Test Case to an existing template, perform the following steps:
   a. Right-click on this Test Case node in the User Defined Tests tree and select Add to template from the shortcut menu. You are prompted to select the template file that you want to add this Test Case to.
   b. Select the template that you want to add this Test Case to and select Save.

4. To create a new Test Case based upon a template, perform the following steps:
   a. Right-click on the User Defined Tests node and select Load template from the shortcut menu. You are prompted to select the template that you want to use.
   b. Select a template and click Open. All of the Test Cases that were saved in the template are now listed in the User Defined Tests tree.

You can specify that you want a specific template file automatically loaded each time a QualityMonitor project is opened. To do this, select a Template file on the General Tab of the Options dialog box, and also select the Load Templates on Project Open option.

Renaming User-Defined Test Cases

Task

To rename a user-defined Test Case:

1. Under the User-Defined Tests node, right-click on the Test Case that you want to rename, and select Rename from the shortcut menu.

2. Provide a new name for the Test Case.

Test Case View
Test Reports

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

QualityMonitor allows you to create an HTML test report for the current project. This can be done by selecting Generate Report from the File menu and providing the name and location for the report. The report will then automatically open in your default browser.

Note • If an error message occurs when generating the report, it may be because msxml4.dll or isqm.xlst is not in the same directory as the QualityMonitor executable (isqm.exe). These files must be present to create the report.

Running QualityMonitor from the Command Line

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

QualityMonitor can be run from the command line by using isqm.exe. It can accept the following parameters:

Table 19-5 • QualityMonitor Command Line Parameters

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>

Table 19-5 • QualityMonitor Command Line Parameters (cont.)

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-f &lt;Project File&gt;</td>
<td></td>
<td>Launch QualityMonitor with this Project File. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>isqm.exe -f c:\mydocuments\mytesting\testresults.iqm</td>
</tr>
<tr>
<td></td>
<td></td>
<td>isqm.exe -f c:\mydocuments\mytesting\testresults.iqm -sn</td>
</tr>
<tr>
<td>-sn</td>
<td></td>
<td>Run QualityMonitor silently without any user interaction and no progress display.</td>
</tr>
<tr>
<td>-sb</td>
<td></td>
<td>Run QualityMonitor silently with a progress display. QualityMonitor displays the test names as they are executed and provides an option for the user to cancel.</td>
</tr>
<tr>
<td>-r &lt;Report File&gt;</td>
<td></td>
<td>Generates a report file c:\report.htm with the test results. Works only when using either -sn or -sb.</td>
</tr>
<tr>
<td>-h or -?</td>
<td></td>
<td>Help</td>
</tr>
</tbody>
</table>

Note • When using any -sn or -sb command line options, you can specify the target product using the existing options /c or /f.

- If you use the /f option to specify the product, the input file will be modified with the test results.
- If you use /c to specify the target product, /f options must be used to specify the project file path which will have the test results.
- If both /c and /f parameters are specified, then QualityMonitor gives preference to /c and operates with the product code specified by /c.

QualityMonitor Reference

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

Topics contained in this section provide detailed reference on each user interface element, dialog box, or view in QualityMonitor. This is the same documentation displayed when you click F1 from the QualityMonitor interface. Topics are organized as follows:

- Menus and Toolbar
- QualityMonitor Interface
- Dialog Boxes
- Views
## Menus and Toolbar

QualityMonitor Interface

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The QualityMonitor interface is divided into two main areas. The View List, which appears at the left side of the screen, provides a visual representation of the QualityMonitor project file. It provides easy access to individual views and Test Cases. The right side of the interface changes depending on the view or Test Case selected.

Dialog Boxes

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The following dialog boxes are accessible from within QualityMonitor:

- About QualityMonitor Dialog Box
Chapter 19  Ensuring Package Quality Using QualityMonitor

QualityMonitor Reference

- Add Exclusions Dialog Box
- Component Properties Dialog Box
- Feature Properties Dialog Box
- Install or Configure Feature Dialog Box
- Install or Configure Product Dialog Box
- Installed Data Dialog Box
- Open QualityMonitor Project Dialog Box
- Options Dialog Box
- Product Properties Dialog Box
- Re-install Product/Feature Dialog Box
- Test Item Information Dialog Box
- Test Progress Dialog Box
- Test Result Dialog Box

**About QualityMonitor Dialog Box**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The About InstallShield QualityMonitor dialog box, available by selecting About from the Help menu, displays information about QualityMonitor and AdminStudio, including version and activation code information.

**Add Exclusions Dialog Box**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

On the Add Exclusions dialog box, which is opened by clicking **Add** on the **Exclusions Tab** of the Options dialog box, you can select a Class ID, Prog ID, or Type Library ID to exclude from a Deployment Test. See **Specifying Exclusions for Deployment Testing**.
The following options are included:

### Table 19-7 • Add Exclusions Dialog Box Options

<table>
<thead>
<tr>
<th>Options</th>

<tbody>
<tr>
<td>File Name</td>
<td>Click Browse and select the Application (.exe), Application Extension (.dll), Type Library (.tlb), or ActiveX object (.oxc) file that contains Class IDs, Prog IDs, or Type Library IDs that you want to exclude from the selected Deployment Test.</td>
</tr>
<tr>
<td>Identifier</td>
<td>Identifies the Class IDs, Prog IDs, or Type Library IDs that are associated with the selected file.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Class IDs, Prog IDs, or Type Library IDs that are associated with the selected file.</td>
</tr>
</tbody>
</table>

### Component Properties Dialog Box

*AdminStudio 2019 | QualityMonitor*

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Component Properties dialog box is displayed when you right-click on a Component in the Component list on the right side of the Deployment Status View and select Properties from the shortcut menu.

The following information is listed:

### Table 19-8 • Component Properties Dialog Box Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>

Using MSI Doctor to Verify Package Deployment Status

Install or Configure Feature Dialog Box

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Install or Configure Feature dialog box is displayed when you right-click on a Feature under the Deployment Status node and then select Configure from the shortcut menu.

If you select an option on this dialog box and click OK, QualityMonitor will attempt to install or configure the selected Feature to the settings you specify. Select one of the following options:

- **Default**—Files will be installed to their default location.
- **Local**—Files will be installed on the local machine.
- **Source**—Files will be run from the installation source.
- **On Demand**—Files will be installed when needed.

Note • To complete this operation, you may need the source from which the selected Feature was installed.

Using MSI Doctor to Verify Package Deployment Status

Install or Configure Product Dialog Box

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Install or Configure Product dialog box is displayed when you right-click on the Deployment Status node and then select Configure from the shortcut menu. If you select an option on this dialog box and click OK, QualityMonitor will attempt to install or configure the Product to the settings you specify.

**Installation Location**

Select one of the following options:

- **Default**—Files will be installed to their default location.
- **Local**—Files will be installed on the local machine.
- **Source**—Files will be run from the installation source.
- **On Demand**—Files will be installed when needed.
**Note** • To complete this operation, you may need the source from which the selected feature was installed.

**Installation Type**

Select one of the following options:

- **Minimum**—Only the essential Features will be installed.
- **Typical**—Most commonly used Features will be installed.
- **Complete**—All of the program’s Features will be installed.

**See Also**

Using MSI Doctor to Verify Package Deployment Status

**Installed Data Dialog Box**

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Installed Data dialog box appears when you are using MSI Doctor to verify package deployment status, and you perform the following steps:

**Task** • To view the Installed Data dialog box:

1. Go to the Deployment Status View and right-click on the Deployment Status node, one of the Features listed under it, or a component listed on the right.

2. Select Properties from the shortcut menu to display the Product Properties Dialog Box, Feature Properties Dialog Box, or Component Properties Dialog Box.

3. Click Verify Data. QualityMonitor then checks all of the files and registry entries included in the selected Product, Feature, or Component and then displays them on the Installed Data dialog box.

**Files Tab**

Files are verified by checking their existence in the specified location, and comparing the file size specified in the Windows Installer package to that of the file on the system. On the Files tab, the following icons are used to identify verification errors:

**Table 19-10 • Verification Error Icons**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![File icon]</td>
<td>File is missing.</td>
</tr>
</tbody>
</table>
If you double-click on an item listed on the Files tab, the Windows Explorer opens to the folder containing the selected file.

**Registry Tab**

The Registry tab lists all of the registry keys and value names in the selected Product, Feature, or Component. Registry data is verified by checking the existence of the registry key and the value name (if one exists). The icon is used to indicate that a registry key or value name is incorrect or missing.

*Note* • Only the registry keys and value names are verified; the values themselves are not verified.

*Note* • To save all the deployment status information in the QualityMonitor project file (.iqm), select the *Save deployment status information when saving project* option on the Options Dialog Box.

**Open QualityMonitor Project Dialog Box**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Open QualityMonitor Project dialog box opens when you select to open a QualityMonitor project from the Welcome page, or when you either select Open from the File menu or click the Open button on the toolbar.

From this dialog box, you can either select to open an existing QualityMonitor file (and subsequently enter or browse to it), or select to create a project file based on an installed MSI-based application.

**Options Dialog Box**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Options dialog box, available by selecting Options from the Tools menu, has options on two tabs: General Tab and Exclusions Tab.
General Tab

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The following options are included on the General tab:

Table 19-11 • Options Dialog Box—General Tab Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update the test case status automatically after executing test items</td>
<td>Select this option if you want to automatically update test case status after executing test items. If you do not use this functionality, the View List will not automatically update after a test item has been executed.</td>
</tr>
<tr>
<td>Show Isolation Tests</td>
<td>Use this option to choose when you would like to Show Isolation Tests after performing a Lockdown and Runtime test. You have the following options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Always</strong>—Show this view for all the executables run, irrespective of the presence of records in the IsolatedComponent table and in MsiAssembly SXS records.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Never</strong>—This view will not be shown irrespective of the data.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if the Application is Isolated</strong>—Show this view only if the MSI Package has either IsolatedComponent records or MSIAssembly SXS records.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if the Running Operating System supports Isolation</strong></td>
</tr>
<tr>
<td>Template file</td>
<td>Select a User Defined Tests template file. If you also select the <strong>Load Templates on Project Open</strong> open option, all of the Test Cases in the selected Template file will be automatically loaded when a QualityMonitor project is open.</td>
</tr>
<tr>
<td>Exclusion file</td>
<td>Select an exclusion file to use to filter the test results in the Lockdown and Runtime views. By selecting an exclusion file from a shared location, multiple people can use the same error exclusion settings.</td>
</tr>
</tbody>
</table>

Exclusions Tab

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.
When a Deployment Test is run on a package, some of the tests related to Class IDs, Prog IDs, and Type Library IDs fail because they refer to components which belong to the operating system rather than the software which is being tested. These errors have no impact on the integrity of the software being tested, and cause confusion among some users testing the software. Users need to be able to prevent error messages caused by files that are not affecting the performance of the software package to be listed in the test results.

On the **Exclusions** tab, to prevent these operating systems errors from being reported, you can specify a list of files to be excluded when any of the Class ID, Prog ID, or Type Library ID Deployment Tests are run. You can maintain a different list for each of these three Deployment Tests.

---

**Note** • After a Deployment Test has been run, the test results are listed in the **Class IDs View**, **Prog IDs View**, or **Type Libraries View**. The items included in the exclusion lists are not shown in these views, but are still stored in the QualityMonitor Project File (.iqm). When this project file is opened again in QualityMonitor, the results are checked against the exclusion list before being displayed in the **Class IDs View**, **Prog IDs View**, or **Type Libraries View**.

The following options are included on the **Exclusions** tab:

**Table 19-12 • Options Dialog Box—Exclusion Tab Options**

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Exclusion list</strong></td>
<td>Select the type of Deployment Test that you want to modify the exclusion list for:</td>
</tr>
<tr>
<td></td>
<td>• Class ID</td>
</tr>
<tr>
<td></td>
<td>• Prog ID</td>
</tr>
<tr>
<td></td>
<td>• Type Libraries</td>
</tr>
<tr>
<td><strong>Listing</strong></td>
<td>Listing of the Class IDs, Prog IDs, or Type Libraries that you have chosen to exclude from the selected Deployment Test. The following information is included:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Identifier</strong>—Number identifying the Class ID, Prog ID, or Type Library.</td>
</tr>
<tr>
<td></td>
<td>• <strong>File Name</strong>—Name of file that contains the Class ID, Prog ID, or Type Library.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Status</strong>—The exclusion status is either <strong>Active</strong> or <strong>Inactive</strong>. Only <strong>Active</strong> exclusions are excluded from the test results. <strong>Inactive</strong> exclusions are neglected/omitted from the exclusion process. The only way to change the status from <strong>Active</strong> to <strong>Inactive</strong> (or vice versa) is to manually edit the exclusions file.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>—The exclusion type is either <strong>User</strong> or <strong>System</strong>. Exclusions added by the user are of <strong>User</strong> type. Users can delete only <strong>User</strong> type exclusion entries.</td>
</tr>
<tr>
<td><strong>Add</strong></td>
<td>Click to open the <strong>Add Exclusions Dialog Box</strong>, where you can select a Class ID, Prog ID, or Type Library to exclude from Deployment Tests.</td>
</tr>
<tr>
<td><strong>Remove</strong></td>
<td>Click to delete the selected Class ID, Prog ID, or Type Library from the exclusion list.</td>
</tr>
</tbody>
</table>
Product Properties Dialog Box

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Product Properties dialog box is displayed when you right-click on the Deployment Status node and then select Properties from the shortcut menu.

This dialog box contains the following options:

Table 19-13 • Product Properties Dialog Box Options

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>Product version.</td>
</tr>
<tr>
<td>Publisher</td>
<td>Manufacturer of Product.</td>
</tr>
<tr>
<td>Product Code</td>
<td>Number which uniquely identifies this Product.</td>
</tr>
<tr>
<td>Local</td>
<td>Directory on local machine where this MSI file is located.</td>
</tr>
<tr>
<td>Registered to</td>
<td>Registered user of Product.</td>
</tr>
<tr>
<td>Product ID Status</td>
<td>Installation status of this Product, such as “The product is installed for the current user.”</td>
</tr>
<tr>
<td>Help Link</td>
<td>Main help link for the Product.</td>
</tr>
<tr>
<td>Installed on</td>
<td>Date Product was installed.</td>
</tr>
<tr>
<td>Installed from</td>
<td>Location where Product was installed from.</td>
</tr>
</tbody>
</table>

Verify Data  Click to verify the following for the selected Product:

- **Files**—QualityMonitor verifies the existence of files in the specified location, and compares the file size specified in the Windows Installer .msi package to that of the file on the system. Missing or modified files are identified.

- **Registry**—QualityMonitor verifies the Registry data by checking the existence of the registry key and the value name (if one exists). Only the registry keys and value names are verified; the values themselves are not verified. Missing or incorrect registry keys are identified.

The Files and Registry information is listed on the Installed Data Dialog Box.

Note • To save all the deployment status information in the QualityMonitor project file (.iqm), select the Save deployment status information when saving project option on the Options Dialog Box.
Re-install Product/Feature Dialog Box

The Re-install Product/Feature dialog box is displayed when you right-click on a Feature under the Deployment Status node or you right-click on the Deployment Status node and then select Re-install from the shortcut menu.

If you select an option on this dialog box and click OK, QualityMonitor will attempt to reinstall the selected Feature(s) to the settings you specify. Select one option from the Select Reinstall Mode or Additional Reinstall Modes property:

<table>
<thead>
<tr>
<th>Table 19-14 • Re-install Product/Feature Dialog Box Options</th>

<tr>
<td></td>
</tr>
</tbody>
</table>

See Also
Using MSI Doctor to Verify Package Deployment Status

Runtime Test Filters Dialog Box

The Runtime Test Filters Dialog box opens when you click the Set Filters button on one of the Lockdown and Runtime Test views: Files View, Folders View, Registry Entries View, or Isolation Tests View.

All of the errors that were generated for that Lockdown and Runtime Test Case are listed. If you want to exclude specific errors from future Lockdown and Runtime tests, select those errors and click OK.
These settings are stored in the default exclusion list (the Exclusion file selected on the General Tab of the Options dialog box), but no changes are made to the Project file.

**Test Item Information Dialog Box**

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Test Item Information dialog box is displayed when you right-click on a Test Item and select Test Item Information from the shortcut menu. The following information is included:

**Table 19-15 • Test Item Information Dialog Box Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Item</td>
<td>The file name and path of the selected Test Item.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the selected Test Item: Passed, Failed, or Pending.</td>
</tr>
<tr>
<td>Comments</td>
<td>Any comments that were entered to document this Test Item.</td>
</tr>
<tr>
<td>Test Details</td>
<td>Specific test details that can include the error message associated with the selected Test Item that was generated during testing. These error messages can help you diagnose issues with the package.</td>
</tr>
</tbody>
</table>

### Test Progress Dialog Box

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Test Progress dialog box opens when you execute Test Items. Note the following:

- If you are performing Test Cases which have automatic execution (such as Type Libraries, Prog IDs, Services, or Class IDs), this dialog box opens briefly and automatically closes when execution is complete.

- For non-automatic Test Cases (Help Files, File Associations, and Shortcuts), this dialog box opens for each Test Item selected, allowing you to run the test and perform any necessary manual actions.

- Following execution of Test Items, the Test Result Dialog Box appears.

### Test Result Dialog Box

AdminStudio 2019 | QualityMonitor

**Edition** • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.
The Test Result dialog box opens following execution of each Test Case requiring manual operations (Help Files, File Associations, and Shortcuts).

You can enter **Comments** about the execution of the functionality, and click **Yes** or **No** depending on whether the Test Item passed.

**Views**

**AdminStudio 2019 | QualityMonitor**

*Edition: QualityMonitor is included with AdminStudio Professional and Enterprise Editions.*

The following views are available in QualityMonitor:

- Welcome to QualityMonitor View
- Product Information View
- Test Cycle Summary View
- Deployment Tests View
  - Class IDs View
  - File Associations View
  - Help Files View
  - Prog IDs View
  - Shortcuts View
  - Type Libraries View
  - ODBC Data Sources View
  - ODBC Drivers View
  - Services View
- Lockdown and Runtime Tests View
  - Runtime Execution Details View
  - Files View
  - Folders View
  - Registry Entries View
  - Isolation Tests View
- User-Defined Tests View
  - Test Case View
- Deployment Status View

Welcome to QualityMonitor View

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Welcome to QualityMonitor View is the view that is displayed before a project is created or opened. From this view you can choose to create a new QualityMonitor project, browse to an existing project, or open the most recently used project.

This view also lists the three major steps involved in using QualityMonitor to ensure package quality:

- **Open project**—Create or open a QualityMonitor project.
- **Run tests**—Run deployment tests, runtime and lockdown tests, or user-defined custom tests.
- **Analyze results**—Analyze the results of the tests.

Product Information View

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Product Information view displays information about the package you are testing in QualityMonitor.

The following data is displayed:

Table 19-16 • Product Information View Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>The name of the application.</td>
</tr>
<tr>
<td>Author</td>
<td>The person or company who created the application.</td>
</tr>
<tr>
<td>Product Code</td>
<td>The package’s product code.</td>
</tr>
<tr>
<td>Package Code</td>
<td>The package’s package code.</td>
</tr>
<tr>
<td>Installed On</td>
<td>The date when the package was installed on the system.</td>
</tr>
<tr>
<td>Version</td>
<td>The package’s version.</td>
</tr>
</tbody>
</table>

Note • In the View List, this view is titled with the product name.
Test Cycle Summary View

The Test Cycle Summary view provides statistics on the number of Test Cases and Test Items in the QualityMonitor project, and the ratio of cases and items passed, failed, or pending. If you add additional Test Cases, or perform runtime checking, the number of Test Cases and items will increase.

Deployment Tests View

Deployment tests help you with up to several Test Cases to run on your Windows Installer-based application. Tests are only available if the application has the corresponding associated data (for example, if there are no shortcuts, you cannot run the Shortcuts Test Case).

QualityMonitor includes the following deployment tests:

- Class IDs View
- File Associations View
- Help Files View
- Prog IDs View
- Shortcuts View
- Type Libraries View
- ODBC Data Sources View
- ODBC Drivers View
- Services View

Automatically Running All Deployment Tests Silently

You can choose to run all deployment tests silently (without prompting for user input) using either the Interface or the command line.

From the Interface

You can choose to run all deployment tests silently (without prompting for user input) by making a selection in the QualityMonitor interface.
Task

To run all deployment tests silently from the Interface, do one of the following:

1. On the QualityMonitor Product Information View, select the Deployment Tests root node and then do one of the following:
   - Click the Execute All Deployment Tests button.
   - Select All Deployment Tests from the Execute menu.
   - Click the Execute All Deployment Tests toolbar button:

   When you select one of these options, a dialog box with a progress bar and an option to cancel will be displayed.

From the Command Line

You can also run all deployment tests silently by entering a command in the command line. See Running QualityMonitor from the Command Line for more information.

Class IDs View

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Class IDs Deployment Test is run to determine if the Class ID COM objects can be instantiated programatically.

At the bottom of the view, you can see all Test Items associated with the Test Case, and can run these items either individually or simultaneously. You can also view individual Test Item details. At the top of the view, you can see and set the status of the entire Test Case, see Test Case progress, filter Test Item data, clear the results, or add comments.

See Also
Checking Class IDs

File Associations View

AdminStudio 2019 | QualityMonitor

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The File Associations Deployment Test is run to determine if all file extensions have been installed and associated correctly. This involves launching a file with this extension, and determining if the correct application was used.

At the bottom of the view, you can see all Test Items associated with the Test Case, and can run these items either individually or simultaneously. You can also view individual Test Item details. At the top of the view, you can see and set the status of the entire Test Case, see Test Case progress, filter Test Item data, clear the results, or add comments.

Checking Help Files

Prog IDs View

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Prog IDs Deployment Test is run to ensure that the Prog IDs COM objects can be instantiated programatically.

At the bottom of the view, you can see all Test Items associated with the Test Case, and can run these items either individually or simultaneously. You can also view individual Test Item details. At the top of the view, you can see and set the status of the entire Test Case, see Test Case progress, filter Test Item data, clear the results, or add comments.

Checking Type Libraries

Manifests View

AdminStudio 2019 | QualityMonitor

The Manifests Deployment Test is run to test the manifests and assemblies used to isolate a Windows Installer package.

The Manifests Deployment Test tests information from the MsiAssembly and MsiAssemblyName tables. QualityMonitor reads through the manifest/assembly files and performs the baseline Class IDs, Prog IDs, or Type Libraries testing for each entry in the files.

Figure 19-3: QualityMonitor Manifests View

Right-click on the Test Item you want to run and select Run from the shortcut menu. You can also use the Shift or Ctrl keys to select multiple Test Items to run, or click Run All to run all available Test Items.
When testing is finished, results are recorded in the Test Case Progress area. Also, the Status of each test item (Passed, Failed, or Pending) is listed next to the Manifest File name.

When a Test Item is failed, you can view details about it, including the error message associated with it on the Test Item Information dialog box. To access this dialog box, right-click on the Test Item and then select Test Item Information from the shortcut menu.

At the bottom of the view, you can see all Test Items associated with the Test Case, and can run these items either individually or simultaneously. You can also view individual Test Item details. At the top of the view, you can see and set the status of the entire Test Case, see Test Case progress, filter Test Item data, clear the results, or add comments. If desired, you can also enter comments in the Comment field on this view.

**ODBC Data Sources View**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The ODBC Data Sources Deployment Test is run to verify the ODBC data sources.

At the bottom of the view, you can see all ODBC DSNs associated with the Test Case, and can run these items either individually or simultaneously. You can also view individual Test Item details. At the top of the view, you can see and set the status of the entire Test Case, see Test Case progress, filter Test Item data, clear the results, or add comments.

*Note* • On the ODBC Data Sources View, only those data sources that belong to the current logged-in user are listed.

- For certain ODBC data sources, additional connection information is required for verification. When the tests are run in Full user interface mode, additional dialog boxes may be displayed during the test to prompt for more input. However, when the tests are run in Silent user interface mode, these additional dialog boxes will not be displayed and results will be based on default information.

**Lockdown and Runtime Tests View**

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

From the Lockdown and Runtime Tests View, you can select whether you want to perform runtime checking using a shortcut or an executable in the installed package.

You can select an item in the associated list and click Run to launch the application. After exercising the application’s functionality and closing it, additional views will appear associated with the executable. These views initially display test items that failed during application operation, and are grouped into:

- Runtime Execution Details View
- Files View
- Folders View
- Registry Entries View
- Isolation Tests View

If you want to execute tests in the context of a different user (under a different user account), click Run As. For more information, see Performing Lockdown and Runtime Tests Under a Different User Account.
Caution • Lockdown and runtime checks cannot be performed on Windows 9x-based systems.

Runtime Execution Details View

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

When a Lockdown and Runtime test is run on a package executable or shortcut, a new node with the name of that executable or shortcut is listed under the Lockdown and Runtime Test Node. When you select this executable or shortcut node, the Runtime Execution Details View opens, listing a summary of the execution of the Lockdown and Runtime tests.

Figure 19-4: Shortcut Node under the Lockdown and Runtime Tests Node

On the Runtime Execution Details View, the following information is included:

Table 19-17 • Lockdown and Runtime Tests View / Runtime Execution Details View Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Progress</td>
<td>The Progress area includes the following information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Total test cases</strong>—Number of test cases (Files, Registry Entries, Folders, Isolation Tests for the selected executable or shortcut) that generated failures plus those test cases that have not yet been completed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Passed, Failed, Pending</strong>—Percentage of total test cases that passed the test, failed the test, or have not yet been executed.</td>
</tr>
<tr>
<td></td>
<td>If an executable or shortcut was run without any failures, the Progress area is not displayed.</td>
</tr>
<tr>
<td>Last Run At</td>
<td>Date and time that the last Lockdown and Runtime test was performed, and the name of the user who performed that test.</td>
</tr>
</tbody>
</table>

Files View

Edition • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.
When a Lockdown and Runtime test is run on a package executable or shortcut, a new node with the name of that executable or shortcut is listed under the **Lockdown and Runtime Test Node**. Under this executable or shortcut node, nodes for each Test Case that generated failures or has not yet been executed are listed. If any file errors were generated during this test, then the **Files** node appears.

When the **Files** node is selected, the Files View opens and includes the following information:

**Table 19-18 • Lockdown and Runtime Tests View / Files View Options**

<table>

Folders View

AdminStudio 2019 | QualityMonitor

*Edition* • QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

When a Lockdown and Runtime test is run on a package executable or shortcut, a new node with the name of that executable or shortcut is listed under the **Lockdown and Runtime Test Node**. Under this executable or shortcut node, nodes for each Test Case that generated failures or has not yet been executed are listed. If any file errors were generated during this test, then the **Folders** node appears.

When the **Folders** node is selected, the Folders View opens and includes the following information:

### Table 19-19 • Lockdown and Runtime Tests View / Folders View Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Test Case Status | The Test Case Status area displays the state for the entire Test Case.  
  • If failures were generated when this Test Case was executed, QualityMonitor sets the status to Failed.  
  • If one of the Test Cases has not yet completed, QualityMonitor sets the status to Pending.  
  • If no failures were generated, QualityMonitor sets the status to Passed.  

Depending on your business practices and standards, you may want to override the status of a Test Case from its current state. In this instance, you would manually select another status. In most cases, this will be setting a Test Case which QualityMonitor has marked as Failed (because one or more individual Test Items have failed) to Passed.

| Test Case Progress | The Test Case Progress area includes the following information:  
  • **Total test items**—Number of files that were tested when the shortcut or executable was run. The number of files that were excluded is also listed.  
  • **Passed, Failed, Pending**—Percentage of total test items that passed the test, failed the test, or have not yet been executed. |
When a Lockdown and Runtime test is run on a package executable or shortcut, a new node with the name of that executable or shortcut is listed under the **Lockdown and Runtime Test Node**. Under this executable or shortcut node, nodes for each Test Case that generated failures or has not yet been executed are listed. If any Registry Entry errors were generated during this test, then the **Registry Entries** node appears.

| **View these test items**  | Select one of the following to filter the listing: **All, Passed, Failed, or Pending.** |
| **Set Filter**             | Click on this button to open the **Runtime Test Filters Dialog Box**, which lists all errors that were generated during this test. You can then choose to select the errors that you want to exclude from future Lockdown and Runtime tests.  

These settings are stored in the default exclusion list (the **Exclusion file** selected on the **General Tab** of the **Options** dialog box), but no changes are made to the Project file. This filter is based on the error code associated with an error, and these error codes are stored in the default exclusion list. |
| **Having these errors**    | This list includes all the unique errors that were generated when this Test Case was executed (excluding the errors that were filtered out using the **Set Filters** function).  

Select an item in this list to filter the listing by one type of error that was generated. Selecting any error will show only the corresponding errors in the list. To see all the errors, select **Show All**. |
| **Reset Results**          | Click to reset the status of all of the Test Items to **Pending**. |
Isolation Tests View

You can run Isolation Tests to display the location of all portable executable (PE) files (dll/ocx/exe/tlb/olb) that are launched from a process while performing a Lockdown and Runtime test. Viewing a listing of these portable executable file names and paths makes it easier for you to ensure that the application is fully isolated.

After you perform a Lockdown and Runtime Test for an executable (.exe) or a shortcut on the Lockdown and Runtime Tests View, an additional node called Isolation Tests is added to the tree under the executable or shortcut node.

When you select this Isolation Tests node, the filenames of the portable executable files and their paths are listed. By default, the status of all these items is Pending. To ensure that all of the executables or shortcuts in this test case are isolated, go to the Test Case Status area of the view, and set the status of the entire test case to either Pending, Passed, or Failed.

Note • The Isolation Tests node will be added to the Lockdown and Runtime Tests tree only if the selected executable launches at least one portable executable file.

- You can specify when you would like the Isolation Tests node on the General tab of the Options Dialog Box. On the General tab, select an option from the Show Isolation Tests list.
- QualityMonitor does not support isolation testing under Windows 2000.

User-Defined Tests View

As your business practices dictate, you can add additional, custom tests to the QualityMonitor project file. This is accomplished by right-clicking on the User-Defined Tests view and selecting Add Test Case.

See Also
Creating Custom Test Cases
Test Case View

QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

When you select a user-defined Test Case under User-Defined Tests on the View List, the Test Case View opens.

This view contains the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Case Status</td>
<td>Specify the status of the selected Test Case by selecting one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Pending—Test case has not been executed.</td>
</tr>
<tr>
<td></td>
<td>• Passed—Test case has been executed and has passed.</td>
</tr>
<tr>
<td></td>
<td>• Failed—Test case has been executed and has failed.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Enter any instructions to explain how to execute this Test Case.</td>
</tr>
<tr>

Creating Custom Test Cases

Deployment Status View

QualityMonitor is included with AdminStudio Professional and Enterprise Editions.

The Deployment Status View lists all of the products and features in the MSI package.

Products and features in the MSI package are listed in the Deployment Status tree, with an icon indicating its status:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🗝️</td>
<td>installed</td>
</tr>
<tr>
<td>✗</td>
<td>not installed</td>
</tr>
<tr>
<td>🔒</td>
<td>a key file is either missing or does not match the version or size of that file recorded in the MSI file</td>
</tr>
</tbody>
</table>
When you select the Deployment Status node, all of the components in all of the product features are listed on the right. If you select an individual feature, only those components within that feature are listed. The following information is displayed:

**Table 19-23 • Deployment Status View Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component Name</td>
<td>Name of all components in the MSI package or selected feature.</td>
</tr>
<tr>
<td>Component Status</td>
<td>Status of the listed component: either installed (✓), not installed (✗), or a key file is either missing or does not match the version or size of that file recorded in the MSI file (✗)</td>
</tr>
<tr>
<td>Component Location</td>
<td>Location of installed component.</td>
</tr>
<tr>
<td>Component ID</td>
<td>GUID of the component, which uniquely identifies it.</td>
</tr>
</tbody>
</table>

*Using MSI Doctor to Verify Package Deployment Status*
AdminStudio provides several straightforward ways to distribute your applications and packages. Application Manager opens different versions of the Distribution Wizard depending upon what is selected in the tree when you click the Distribute button:

- **Application**—If you have an application (or a group containing applications) selected, a Distribution Wizard that is customized to publishing applications to System Center 2012 Configuration Manager or later, Citrix XenApp Server, Symantec Altiris Management Server, Microsoft App-V Server, Workspace ONE Server, and JAMF Casper Suite Server opens.

- **Package**—If you have a package selected, the Package Distribution Wizard opens, which is customized to preparing packages for distribution to System Center 2007 or 2012 Configuration Manager, ZENworks Configuration Management, Altiris 6.5 Notification Server, an FTP location, a network location, or an administrative installation.
This section covers how to publish both applications and packages using AdminStudio's distribution tools.

### Table 20-1 • AdminStudio Distribution Tools

<table>
<thead>
<tr>
<th>Tool</th>

<tr>
<td>Microsoft UWP app packages</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>

Note: If you are using an Application Catalog that has been upgraded from a release of AdminStudio prior to AdminStudio 2013, and the iOS application was imported prior to the upgrade, you will need to reimport the iOS application before you will be able to successfully publish it to Workspace ONE Server.
Important • When publishing applications to one of these distribution systems, the selected applications’ supported packages will be published. However, if an application contains packages of other deployment types, those packages will be ignored.

MST files (excluding SoftwareId.mst) are the only MSI supporting files that will be published to Workspace ONE. Other supporting files like MSPs will be skipped during publish.

Files dependent on MSI (other than MSTs) will not be published to Workspace ONE.

Example: cabinet files, configuration xml files, .dlls, .configs etc.

To publish applications from the Application Catalog to a distribution system, perform the following steps.

**Task**

To publish an application or group of applications to a distribution system:

1. Create a named connection to a distribution system on the Server Options > Distribution System tab of the Options dialog box, as described in Creating Multiple Named Connections to Distribution Systems.

2. For each application that you want to publish, specify deployment settings on the following subtabs of the Home Deployment Type View:
   - Deployment Data Tab (for System Center 2012 Configuration Manager or later distribution)
   - App-V Deployment Data Tab
   - XenApp Deployment Data Tab
   - Altiris Deployment Data Tab
   - Workspace ONE Deployment Data Tab

Important • In order to publish to Citrix XenApp Server, there are mandatory fields that you must specify on the XenApp Deployment Data Tab, as described in Specifying a Package’s XenApp Deployment Settings. For all other deployment technologies, editing deployment data is optional.
Note: If you are using an Application Catalog that has been upgraded from a release of AdminStudio prior to AdminStudio 2013, and the iOS application was imported prior to the upgrade, you will need to reimport the iOS application before you will be able to successfully publish it to Workspace ONE Server.

3. In the Application Catalog tree, select the application or group of applications that you want to publish and click the Distribute button in the ribbon. The Choose Applications panel opens, with the application or group that was selected when you clicked the Distribute button already selected.

Tip: Instead of clicking the Distribute button in the ribbon, you could instead select Distribute Application or Distribute Group from the shortcut menu.

4. Choose the application or applications that you want to publish and click Next. The Target Server Details panel opens.
5. From the **Server type** list, select the type of distribution system you want to publish applications to:
   - Microsoft System Center Configuration Manager
   - Microsoft App-V Management Server
   - Symantec Altiris Management Server
   - Citrix XenApp Server
   - Casper Suite Server
   - Workspace ONE Server

6. From the **Connection name** list, select the named connection to the distribution system server that you want to publish applications to.

   **Note** • In order to populate this list, you must have already set up at least one named connection to a distribution system server, as described in Creating Multiple Named Connections to Distribution Systems.

   **Important** • Because you cannot publish applications to System Center 2007 Configuration Manager, do not select a named connection to a System Center 2007 Configuration Manager server from this list. To publish a package to System Center 2007 Configuration Manager, you need to use the Package Distribution Wizard, as described in Publishing Packages to Microsoft System Center Configuration Manager.

7. Click **Next**. One of the following occurs:
   - If you are publishing to Microsoft System Center Configuration Manager or Workspace ONE, the **Destination Group** panel opens. Proceed with Step 8.
• For all other distribution systems, the **Summary** panel opens. Skip to Step 9.

8. Select the group in the connected System Center 2012 Configuration Manager or Workspace ONE server that you want to publish applications to.

**Note** • *If you originally imported the application from System Center 2012 Configuration Manager server, the Destination Group panel will not open, and the application will be published in its source location.*

**Note** • *Workspace ONE permits publishing a single application only once to an Organization Group. Therefore, if you attempt to publish an application to an Workspace ONE Organization Group (Distribution Group) that already contains that application, the publication will fail.*

9. Click **Next**. The **Summary** panel opens, displaying a summary of all settings configured in the previous panels.
10. Click **Next**. The distribution begins and the **Distributing** panel opens, which displays a progress bar and status messages during distribution.

![Distribution Wizard](image)

11. When distribution is complete, click **Finish** to exit the wizard.

Distributing Packages Using the Package Distribution Wizard

Distribution Wizard
Distributing Packages Using the Package Distribution Wizard

AdminStudio 2019 | Package Distribution Wizard

The Package Distribution Wizard provides a straightforward way to distribute your packages or prepare them for distribution through a wide variety of distribution methods.

**Important** • You can use the customized Distribution Wizard to publish applications to System Center 2012 Configuration Manager and Citrix XenApp Server. See Distributing Applications Using the Distribution Wizard.

You can use the Package Distribution Wizard to publish App-V, Windows Installer, or legacy packages to Microsoft System Center 2007 Configuration Manager. You can also use the Package Distribution Wizard to assist you in deploying your packages using any of the following distribution types:

**Table 20-4 • Supported Distribution Types**

<table>
<thead>
<tr>
<th>Distribution Type</th>
<th>Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Install</td>
<td>Creating Administrative Installitions for Packages</td>
</tr>
<tr>
<td>FTP Location</td>
<td>Distributing Packages to FTP Servers</td>
</tr>
<tr>
<td>Altiris 6.5</td>
<td>Preparing for Altiris 6.5 Distribution</td>
</tr>
<tr>
<td>Network Location</td>
<td>Distributing Packages to Network Locations</td>
</tr>
<tr>
<td>System Center Configuration Manager</td>
<td>Publishing Packages to Microsoft System Center Configuration Manager</td>
</tr>
<tr>
<td>ZENworks Configuration Management Distribution</td>
<td>Preparing for ZENworks Configuration Management Distribution</td>
</tr>
</tbody>
</table>

You can launch the Package Distribution Wizard from Application Manager by selecting a package in the tree and then clicking the Distribute button in the Home tab of the ribbon or by right-clicking on a package and selecting Distribute Package from the shortcut menu. You can also launch the Package Distribution Wizard from the Windows Start menu.

**Important** • If you right-click on an application in the Application Catalog tree and select Distribute Application from the shortcut menu, Package Distribution Wizard will not display the Distribution Type panel; instead, you will immediately be prompted to connect to a System Center 2012 Configuration Manager Server, since that is the only distribution type that supports applications.

This section also explains how to deploy a Windows installer package using an InstallShield script-based setup. See Deploying InstallScript MSI Installations.
Creating Administrative Installations for Packages

AdminStudio 2019 | Package Distribution Wizard

In an administrative installation, the installation software is copied to a network directory using the administrative install option provided by Windows Installer.

Task To distribute your package (and any associated transforms) as an administrative installation:

1. Launch the Package Distribution Wizard by either clicking on its icon in the Tools Gallery or by right-clicking on a package in the Application Catalog tree and selecting Distribute Package from the shortcut menu.

2. On the Welcome panel, click Next. The Distribution Type panel opens.

3. From the Distribution Type panel, select Administrative Install and click Next. The Package Information panel opens.

4. On the Package Information panel, click the Browse button and locate the Windows Installer (.msi) package that you want to distribute.

   If you launched the Package Distribution Wizard from Application Manager by right-clicking on a package and selecting Distribute Package from the shortcut menu, the name in the Windows Installer Package (.msi) field is already entered. The ability to edit this entry depends upon whether the package you are distributing is managed by the Software Repository:

   - **Not in the Software Repository**—The full name and path of the file is displayed, and you can edit this entry or click Browse and select a different package.

   - **In the Software Repository**—Only the name of the file is displayed (not the full path) and this entry cannot be edited or changed.

5. If there are transforms associated with the package, click the New button in the Windows Installer Transform Files (*.mst) area and navigate to the transform you want to add. Repeat as necessary.

6. If desired, add additional Windows Installer properties in the Specify Additional MSI Properties field.

7. After specifying the package location, click Next. The Administrative Install panel opens.

8. From the Administrative Install panel, specify or browse to the Network Directory to which you want to distribute the package.

9. If desired, you can use short file names during the distribution by selecting the Use short file names option.

   **Note** • Select this option to force the administrative installation to use the 8.3 file name convention (using the SHORTFILENAMES property).

10. Click Next. The Distribution Summary panel opens.

11. On the Distribution Summary panel, review the selections you made. If you are satisfied with them, click Next to distribute the package, including associated transforms and files. The Distribution Output panel displays progress during distribution.

12. Once the distribution finishes, click Finish to exit the Package Distribution Wizard.
Distributing Packages to FTP Servers

AdminStudio 2019 | Package Distribution Wizard

You can choose to distribute a package to an FTP server. If you select the FTP Location option on the Package Distribution Wizard Distribution Type panel, you will be required to enter the location of the FTP server, and the user name and password to connect to that server.

Task

To distribute your package (and any associated transforms) to an FTP server:

1. Launch the Package Distribution Wizard.
2. On the Welcome panel, click Next. The Distribution Type panel opens.
3. From the Distribution Type panel, select FTP Location and click Next. The Package Information panel opens.
4. On the Package Information panel, click the Browse button and locate the Windows Installer Package (.msi) you want to distribute.
5. If there are transforms associated with the package, click the New button ( ) in the Windows Installer Transform Files (*.mst) area and navigate to the transform you want to add. Repeat as necessary.
6. If desired, add additional Windows Installer properties in the Specify Additional MSI Properties field.
7. After specifying the package location, click Next. The FTP Location panel opens.
8. From the FTP Location panel, specify the location of the FTP server, and the user name and password to use to connect to the server. Click Next.
9. Review the selections you made in the Distribution Summary panel. If you are satisfied with them, click Next to distribute the package, including associated transforms and files.
10. The Distribution Output panel displays progress during distribution. Once the distribution finishes, click Finish to exit the Package Distribution Wizard.

Preparing for Altiris 6.5 Distribution

AdminStudio 2019 | Package Distribution Wizard

The Distribution Wizard supports the distribution of a setup along with any transforms and files via an Altiris 6.5 Notification Server. A custom script file is required for Altiris distribution. The Distribution Wizard creates this custom script file using an XML template file that is provided: AltirisTemplate.Config.

Task

To prepare your package for Altiris distribution:

1. Launch the Distribution Wizard. The Distribution Wizard Welcome panel opens.
2. Click Next. The Distribution Type panel opens.
3. Select Altiris 6.5 from the Distribution Type list and click Next. The Package Information panel opens.
4. Click the Browse button and locate the Windows Installer Package (.msi) you want to distribute.
Chapter 20  Distributing Applications and Packages
Distributing Packages Using the Package Distribution Wizard

Note • The package that was selected when the Distribution Wizard was launched is automatically specified.

5. If there are transforms associated with the package, click the Add button in the Additional Transforms area and navigate to the transform you want to add. Repeat as necessary.

6. After specifying the package location, click Next. The Altiris Integration panel opens.

7. In the Network Directory field, specify or browse to the network location where you want to store the installation package. The Distribution Wizard remembers the last Network Location that is entered and displays it the next time this panel is accessed.

The Distribution Wizard will copy the Windows Installer package along with any transforms and files to the UNC path specified. Also, the Distribution Wizard will use an XML template file (AltirisTemplate.config) to create a custom script file in this location named <packageName>.Config.

Note • You can edit AltirisTemplate.config to customize it for your organization. The file, which is installed with AdminStudio, is located in the Templates folder of the AdminStudio Shared directory. See Altiris XML Template for more information.

8. In the Windows Installer Command Line field, enter any additional properties that you want to pass to the Windows Installer.

9. In the Altiris Server Location field, enter the http: address for the location of the Altiris Server. The Distribution Wizard remembers the last Altiris Server Location that is entered and displays it the next time this panel is accessed.

10. In the User Name and Password fields, enter a User Name and Password to log onto the server entered in the Altiris Server Location field. The Distribution Wizard remembers the last User Name that is entered and displays it the next time this panel is accessed.

11. Click Next. The Distribution Summary panel appears, listing the selections you made in the previous panels.

12. Review the information on the Distribution Summary panel. If you are satisfied with them, click Next. The Distribution Output panel displays progress during distribution.

13. Once the distribution finishes, click Finish to exit the Distribution Wizard.

Note • For all distribution types, the Distribution Wizard will create a Distribution log file in the Distribution folder of the AdminStudio Shared directory.

Distributing Packages to Network Locations

AdminStudio 2019 | Package Distribution Wizard

To distribute a package to a network directory, select the Network Location option on the Package Distribution Wizard Distribution Type panel.
Task To distribute your package (and any associated transforms) to a network location:

1. Launch the Package Distribution Wizard. The Package Distribution Wizard Welcome panel opens.
2. On the Welcome panel, click Next. The Distribution Type panel opens.
3. From the Distribution Type panel, select Network Location and click Next. The Package Information panel opens.
4. On the Package Information panel, click the Browse button and locate the Windows Installer Package (.msi) you want to distribute.
5. If there are transforms associated with the package, click the New button ( ) in the Windows Installer Transform Files (*.mst) area and navigate to the transform you want to add. Repeat as necessary.
6. If desired, add additional Windows Installer properties in the Specify Additional MSI Properties field.
7. After specifying the package location, click Next. The Network Location panel opens.
8. From the Network Location panel, specify or browse to the Network Directory location to which you want to distribute the package, and click Next. The Distribution Summary panel opens.
9. On the Distribution Summary panel, review the selections you made. If you are satisfied with them, click Next to distribute the package, including associated transforms and files. The Distribution Output panel displays progress during distribution.
10. Once the distribution finishes, click Finish to exit the Package Distribution Wizard.

Publishing Packages to Microsoft System Center Configuration Manager

AdminStudio 2019 | Package Distribution Wizard

Using AdminStudio’s Package Distribution Wizard, you can publish individual Windows Installer (.msi), Microsoft App-V 4.x (.sft), or legacy setup (.exe) packages to System Center Configuration Manager. You can use the Package Distribution Wizard to publish packages on your file system or from your the Application Catalog tree in Application Manager.

Important • To publish applications to System Center 2012 Configuration Manager, you need to use the application-based Distribution Wizard, as described in Distributing Applications Using the Distribution Wizard.

Note • Using the Package Distribution Wizard, App-V 4.x packages can only be published to System Center 2007 Configuration Manager. However, Windows Installer and legacy setups can be published to both System Center 2007 Configuration Manager and System Center 2012 Configuration Manager using the Package Distribution Wizard.

You can launch the Package Distribution Wizard from Application Manager by selecting a package in the tree and then clicking the Distribute button in the Home tab of the ribbon or by right-clicking on the package and selecting Distribute Package from the shortcut menu. You can also launch the Package Distribution Wizard from the Windows Start menu.

To publish a Windows Installer, App-V, or legacy package from the Application Catalog to a Microsoft System Center Configuration Manager server, perform the following steps.
Task

To publish a package to Microsoft System Center Configuration Manager:

1. Select the package that you want to publish in the Application Catalog tree and click the Distribute button in the Application Manager ribbon (or right-click on the package and select Distribute Package from the shortcut menu). The Welcome panel opens.

   Tip • You can also launch the Package Distribution Wizard from the AdminStudio Tools Gallery or from the Windows Start menu.

2. Click Next. The Distribution Type panel opens.

3. Select Configuration Manager and click Next. The Package Information panel opens.

   • If you launched Package Distribution Wizard with a package selected, information about that package is listed.
   • If you launched Package Distribution Wizard without having a package selected, click the Browse button and locate the Windows Installer Package (.msi), Microsoft App-V Package (.sft), or Legacy Setup Package (.exe) that you want to distribute.

4. (Windows Installer packages only) If there are transforms associated with the package, click the New button in the Windows Installer Transform Files (*.mst) area and navigate to the transform you want to add. Repeat as necessary.

5. (Windows Installer packages only) If desired, add additional Windows Installer properties in the Specify Additional MSI Properties field.

6. Click Next. The Connect to a Microsoft System Center Configuration Manager Server panel opens.

7. In the Server field, enter the name of your System Center Configuration Manager server.

8. In the Site Code field, enter the code that identifies your Configuration Manager site.

9. From the Authentication list, choose one of the following options:

   • Server Authentication—Choose this option if you want to use System Center Configuration Manager server login identification to log into this server. Then enter the appropriate User Name and Password.
   • Windows Authentication—Choose this option if you want to use Windows network authentication (your network login ID) to log into this System Center Configuration Manager server.

10. Click Next. The Select Destination Folder panel opens prompting you to select a location that the System Center Configuration Manager server has access to where you want to publish the selected packages.

11. In the Location to Publish Packages field, enter a target path, in UNC format (\Server\Share), of the location where you want to publish the selected packages. Make sure that you enter a location that the System Center Configuration Manager server has access to.

12. From the Authentication list, select one of the following options:

   • Windows Authentication—Choose this option if you want to use Windows network authentication (your network login ID) to log into this location.
   • SCCM Authentication—Choose this option if you want to use System Center Configuration Manager server authentication (your System Center Configuration Manager server login ID) to log into this location.
Distributing Packages Using the Package Distribution Wizard

- **Server Authentication**—Choose this option if you are publishing to an alternate file server that requires credentials. Then enter the appropriate **User Name** and **Password**.

13. Click **Next**. The **Select Group** panel opens.

14. Select the **Target Group** on the Configuration Manager Server where you want to publish the package and click **Next**. The **Distribution Summary** panel opens.

15. On the **Distribution Summary** panel, review the selections you made. If you are satisfied with them, click **Next** to distribute the package. The **Distribution Output** panel displays progress during distribution. When distribution is successful, the message **Successfully published ...** is listed and the background color of the output window turns green.

16. Click **Finish** to exit the Package Distribution Wizard.

**Preparing for ZENworks Configuration Management Distribution**

**Task**

**To prepare your package for ZENworks Configuration Management distribution:**

1. Launch the Package Distribution Wizard by performing the following steps:
   
   a. Launch the **Package Distribution Wizard**.
   b. On the **Welcome** panel, click **Next**. The **Distribution Type** panel opens.
c. Select ZENworks Configuration Management Distribution and click Next.
The Welcome panel of the Distribution Wizard for ZENworks Configuration Management opens.

Edition • If you have AdminStudio ZENworks Limited Edition, you can use a shortcut under AdminStudio Tools to automatically launch the Distribution Wizard for ZENworks Configuration Management.

Note • If you do not want the Welcome panel to be displayed each time you open this wizard, select the Do not show the Welcome panel again option. If this option is selected, the Login panel will be the first panel opened for this wizard.

2. Click Next to continue. The Login panel opens.

3. On the Login panel, enter the following login information for the ZENworks Configuration Management server that you are connecting to:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name / Password</td>
<td>Enter a valid User Name and Password for the ZENworks Configuration Management server you are connecting to.</td>
</tr>
<tr>
<td>Server URL</td>
<td>Enter the server URL, machine name, or IP address of the ZENworks Configuration Management server using the following format:</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.servername.com">http://www.servername.com</a> or <a href="http://111.22.333.44">http://111.22.333.44</a></td>
</tr>
<tr>
<td></td>
<td>If you need to specify a specific port number, append the port number to the end of the URL, such as:</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.servername.com:123">http://www.servername.com:123</a></td>
</tr>
<tr>
<td></td>
<td>If you are using SSL and you want a secure connection, change the http prefix to https. For example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://www.servername.com">https://www.servername.com</a></td>
</tr>
</tbody>
</table>

4. Click Login. The Windows Installer Package Information panel opens.

5. Click Browse next to the Windows Installer Package File (.msi) field and select the Windows Installer package that will be referenced by this ZENworks Configuration Management bundle.

Important • All of the files in the selected Windows Installer file’s directory and all of its subdirectories will be uploaded to the ZENworks Configuration Management Server.

After you make your selection, if there are any transform files (.mst) in the same directory, they are listed in the Windows Installer Transform Files (.mst) area.

Note • All of the .mst files that are in the same directory as the selected Windows Installer package are automatically listed in the Windows Installer Transform Files (.mst) list, even if they are not applicable to the selected package. To prevent the inclusion of non-applicable transform files, delete those transforms from the list.

6. To include transforms with the Windows Installer package:
Click the New button ( ) in the **Windows Installer Transform Files (.mst)** area and select a transform file. If the package requires multiple transforms, you can repeat the procedure as necessary.

Select a transform and click the Delete button ( ) to delete a transform from the list.

### 7. Customize Install Parameters

If you want to customize how this package is installed, enter parameters in the **Install Parameters** field. Any actions that you enter will be performed whenever this bundle is installed.

- The root parameter, which should not be edited or deleted, is `/i packagename.msi`.
- These parameters are applied to `msiexec.exe` to perform the desired action.
- By default, the `/qn` parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input.
  
  If this operation requires user input, either remove the `/qn` parameter, or create a response transform to preconfigure all user input. For more information, see **Using Response Transforms**.

- For additional parameters that can be added, see **Additional Install, Uninstall, and Repair Parameters**.

### 8. Customize Uninstall Parameters

If you want to customize how this package is uninstalled, enter parameters in the **Uninstall Parameters** field. Any actions that you enter will be performed whenever this bundle is uninstalled.

- The root parameter, which should not be edited or deleted, is `/x packagename.msi`.
- By default, the `/qn` parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input.
  
  If this operation requires user input, either remove the `/qn` parameter, or create a response transform to preconfigure all user input. For more information, see **Using Response Transforms**.

- For additional parameters that can be added, see **Additional Install, Uninstall, and Repair Parameters**.

### 9. Customize Repair Parameters

If you want to customize how this package is repaired, enter parameters in the **Repair Parameters** field. Bundles are repaired by reinstalling missing or corrupted files.

- The root parameter, which should not be edited or deleted, is `/f packagename.msi`.
- By default, the `/qn` parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input.
  
  If this operation requires user input, either remove the `/qn` parameter, or create a response transform to preconfigure all user input. For more information, see **Using Response Transforms**.

- You can apply any of the following additional Repair parameters after the package name:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Reinstalls a file if it is missing</td>
</tr>
<tr>
<td>o</td>
<td>Reinstalls a file if it is missing or if an older version of the file is present on the user’s system</td>
</tr>
<tr>
<td>e</td>
<td>Reinstalls a file if it is missing or if an equivalent or older version of the file is present on the user’s system</td>
</tr>
</tbody>
</table>
For additional parameters that can be added, see Additional Install, Uninstall, and Repair Parameters.

10. Click Next. The Bundle Creation Options panel opens.

11. Specify whether to update an existing bundle or create a new one by selecting one of the following options:

   a. **Create a new bundle from these Windows Installer package files**—To create a new bundle to reference this Windows Installer package, select this option.

   b. **Update an existing bundle using these Windows Installer package files**—If you want to overwrite an existing bundle to contain this Windows Installer package, select this option, and then select an existing bundle from the tree:

      - **Recommended Bundles**—This group lists the bundles that contain the same Windows Installer package as the one you selected on the Windows Installer Package Information Panel.

      - **All Other Bundles**—This group lists the rest of the existing bundles on the server.

12. After making your selection, click Next to proceed. The Bundle Information panel opens.

13. Enter information to specify attributes for this bundle on ZENworks Configuration Management:

<table>
<thead>
<tr>
<th>Property</th>
<th>Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bundle Name</td>
<td>Enter the bundle’s name as you want it to appear in ZENworks Control Center (ZCC) and the ZENworks Application Launcher (on managed devices).</td>
</tr>
<tr>
<td>Version Number</td>
<td>Enter the bundle’s version number. If you are overwriting an existing bundle, and you enter a higher version number than the bundle’s original version number, the bundle will be redeployed.</td>
</tr>
<tr>
<td>Icon</td>
<td>Click Browse and select a shortcut icon graphic (in .ico, .gif, .jpg, .png, .bmp, or .exe format) that ZENworks Application Launcher will display on managed devices. If you do not select an icon file, the standard ZENworks bundle icon will be used.</td>
</tr>
</tbody>
</table>
Distributing Packages Using the Package Distribution Wizard

14. After you have entered bundle information, click Next. The Summary panel opens, displaying the options you have selected for distributing this Windows Installer package on ZENworks Configuration Management.

15. Click Publish to complete the distribution process. The Publishing Process panel opens, listing the progress messages while the bundle is being published on ZENworks Configuration Management.

- **ZENworks error messages**—Any error messages with a numeric prefix that appear on this panel are generated by ZENworks Configuration Management. To resolve these errors, contact your ZENworks Configuration Management System Administrator.

- **Canceling publication**—If you want to cancel the publication of the bundle on ZENworks Configuration Management, click Cancel.

16. When processing is complete, the Finish button becomes enabled. Click Finish to exit this wizard.

**See Also**
Distribution Wizard for ZENworks Configuration Management

### Deploying InstallScript MSI Installations

**AdminStudio 2019 | Package Distribution Wizard**

When deploying an InstallScript MSI installation, the file setup.exe needs to be deployed with the InstallScript .msi installation file. The setup.exe file is required because it launches a file (isscriptn.msi) that installs the InstallScript engine required to run the InstallScript code. The n in installoscriptn.msi indicates the version of the InstallScript engine that was used to create the InstallScript MSI installation.

If you want to deploy an InstallScript MSI installation without using setup.exe, such as when using Active Directory, you need to first deploy the same version of the InstallScript engine that was used to build the InstallScript MSI installation.
Installing the InstallScript Engine

Sometimes the Isscriptn.msi file (the file that installs the InstallScript engine) is located in the same directory as the InstallScript.msi file. However, in some instances, the Isscriptn.msi file is compressed within the setup.exe file and cannot be accessed.

If the Isscriptn.msi file is compressed within the setup.exe file, you have the following options:

- **If you know which version** of the InstallScript engine was used to create your InstallScript MSI installation, you can get a copy of the InstallScript engine from the AdminStudio installation CD. All the major releases of the InstallScript engine are available in the InstallScript_Engines folder on the AdminStudio installation CD.

  
  \[Note\] For more information, see the Update to the Latest InstallShield Installation Engines Knowledge Base article at

- **If you do not know which version** of the InstallScript engine was used to create your InstallScript MSI installation, contact the software vendor to find out the exact version.

Deploying an InstallScript MSI Installation

To deploy an InstallScript MSI installation, configure the setup and the target system in the following manner:

\[Task\] To deploy an InstallScript MSI installation:

1. Run the Isscriptn.msi file to install the appropriate InstallScript engine on the target machine (where \(n\) is the version of the InstallScript engine that was used to create the application’s InstallScript MSI installation).

2. Create a transform for the InstallScript MSI that includes the following changes:

   a. Add the property ISSETUPDRIVEN to the property table via the Direct Editor and give it a value of 1.

   b. Add a condition to the OnCheckSilentInstall custom action in the InstallExecuteSequence via the Direct Editor that will always resolve to false or remove the custom action from the sequence.

   c. Make any additional changes in the transform, such as populating the serial number, modifying shortcuts or feature states, depending upon your organization’s needs and the features and requirements of the application.

   If deploying the package via Active Directory, make sure that you set the Installation User Interface to Basic and specify any transforms that you created for the InstallScript MSI package.

Reference

AdminStudio 2019 | Package Distribution Wizard and Distribution Wizard

AdminStudio provides several provides straightforward ways to distribute your applications and packages. Application Manager opens different versions of the Distribution Wizard depending upon what is selected in the tree when you click the Distribute button:
• **Application**—If you have an application (or a group containing applications) selected, a Distribution Wizard that is customized to publishing applications to System Center 2012 Configuration Manager, Citrix XenApp Server, Workspace ONE Server, or Symantec Altiris Server opens.

• **Package**—If you have a package selected, the Package Distribution Wizard opens, which is customized to preparing packages for distribution through a wide variety of distribution methods.

AdminStudio includes the following distribution tools:

• Distribution Wizard

• Package Distribution Wizard

• Distribution Wizard for ZENworks Configuration Management

**See Also**

Distributing Applications Using the Distribution Wizard

Distributing Packages Using the Package Distribution Wizard

Preparing for ZENworks Configuration Management Distribution

---

**Distribution Wizard**

You can use the Distribution Wizard to publish applications to System Center 2012 Configuration Manager, Citrix XenApp Server, Workspace ONE Server, or Symantec Altiris Management Server.

Prior to using the Distribution Wizard to publish applications, you must have already set up a named connection to one of these distribution systems, as described in Creating Multiple Named Connections to Distribution Systems.

**Note** • To distribute a package to other distribution systems, a network location, an FTP server, or an administrative location, use the Package Distribution Wizard.

**Note** • For a list of supported deployment types per distribution system, see Distributing Applications Using the Distribution Wizard.

The Distribution Wizard consists of the following panels:

• **Choose Applications Panel**

• **Target Server Details Panel**

• **Destination Group Panel**

• **Summary Panel**

• **Distributing Panel**
Choose Applications Panel

AdminStudio 2019 | Distribution Wizard

When you launch the Distribution Wizard from Application Manager by selecting an application (or a group that contains applications) in the tree and then clicking the Distribute button in the ribbon, the Choose Applications panel opens, prompting you to select the applications that you want to distribute.

![Distribution Wizard / Choose Applications Panel](image)

Figure 20-1: Distribution Wizard / Choose Applications Panel

Select the applications or groups of applications that you want to publish, and then click Next to continue.

Important • You can only publish applications containing Citrix XenApp packages or Microsoft App-V 4.x packages to Citrix XenApp server. Therefore, when publishing to Citrix XenApp server, if you select an application that contains package deployment types other than Citrix XenApp and App-V 4.x, those packages will be ignored.

Important • To publish Apple iOS or Windows Store mobile apps, System Center 2012 Configuration Manager SP1 is required.

Target Server Details Panel

AdminStudio 2019 | Distribution Wizard

On the Target Server Details panel of the Distribution Wizard, which opens after you have selected the applications that you want to publish on the Choose Applications panel, you specify the distribution server you want to distribute to, and you select the named connection to that server that you have already defined.
Figure 20-2: Distribution Wizard / Target Server Details Panel

The **Target Server Details** panel contains the following properties:

**Table 20-5 • Target Server Details Panel**

<table>
<thead>
<tr>
<th>Property</th>

</table>

---
On the Destination Group panel of the Distribution Wizard, which opens after you have selected the target server that you want to publish to on the Target Server Details panel, you select the group in the connected System Center 2012 Configuration Manager or Workspace ONE server that you want to publish applications to.

**Table 20-5 • Target Server Details Panel**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection name</td>
<td>Select the named connection to the distribution server that you want to publish applications to.</td>
</tr>
</tbody>
</table>

**Important** • In order to populate this list, you must have already set up at least one named connection to a distribution system, as described in Creating Multiple Named Connections to Distribution Systems.

**Important** • Because you cannot publish applications to System Center 2007 Configuration Manager, do not select a named connection to a System Center 2007 Configuration Manager server from this list. To publish a package to System Center 2007 Configuration Manager, you need to use the Package Distribution Wizard, as described in Publishing Packages to Microsoft System Center Configuration Manager.

**Destination Group Panel**

AdminStudio 2019 | Distribution Wizard

On the Destination Group panel of the Distribution Wizard, which opens after you have selected the target server that you want to publish to on the Target Server Details panel, you select the group in the connected System Center 2012 Configuration Manager or Workspace ONE server that you want to publish applications to.

**Figure 20-3:** Distribution Wizard / Destination Group Panel
**Note** • If you originally imported the application from System Center 2012 Configuration Manager server, the Destination Group panel will not open, and the application will be published in its source location.

**Note** • When publishing applications to a Citrix XenApp or Symantec Altiris Management server, the Destination Group panel does not open; all applications are published to the same predesignated destination group, such as `\MyServerName\Shared`.

Click **Next** to continue.

**Creating a New System Center Configuration Manager Destination Group**

When publishing to System Center Configuration Manager, you can choose to create a new destination group directly from the Destination Group panel of the Distribution Wizard by clicking the **New Group** button and then entering a name for the new group in the **New Group** dialog box. AdminStudio will create that group on the specified System Center Configuration Manager server, and publish the applications to that group.

![Figure 21: Adding a New Group on Destination Group Panel of Distribution Wizard](image)

**Summary Panel**

AdminStudio 2019 | Distribution Wizard

The **Summary** panel displays a summary of all settings configured in the previous panels. When you click **Next**, the distribution begins and the **Distributing...** panel is displayed.
Figure 20-1: Distribution Wizard / Summary Panel

**Distributing Panel**

AdminStudio 2019 | Distribution Wizard

The Distributing panel displays a progress bar and status messages during distribution. When distribution is complete, click Finish.

Figure 20-2: Distribution Wizard / Distributing Panel
Package Distribution Wizard

The Package Distribution Wizard is used to distribute packages to Microsoft System Center 2007 Configuration Manager, a network location, an FTP server, an administrative location, or using virtually any distribution system.

You can launch the Package Distribution Wizard from Application Manager by selecting a package in the tree and then clicking the Distribute button in the Home tab of the ribbon or by right-clicking on a package and selecting Distribute Package from the shortcut menu. You can also launch the Package Distribution Wizard from the Windows Start menu.

The Package Distribution Wizard consists of the following panels:

- Welcome Panel
- Distribution Type Panel
  - Administrative Install Panel
  - Connect to a Microsoft System Center Configuration Manager Server Panel
- Select Destination Folder
- Select Group
- FTP Location Panel
- Altiris Integration Panel
- Network Location Panel
- Network Location Panel
- Package Information Panel
- Distribution Summary Panel
- Distribution Output Panel

Welcome Panel

The Package Distribution Wizard is used to distribute packages to Microsoft System Center 2007 Configuration Manager, a network location, an FTP server, an administrative location, or several other distribution systems.

You can launch the Package Distribution Wizard from Application Manager by selecting a package in the tree and then clicking the Distribute button in the Home tab of the ribbon or by right-clicking on a package and selecting Distribute Package from the shortcut menu. You can also launch the Package Distribution Wizard from the Windows Start menu.

Click Next to continue.
Distribution Type Panel

AdminStudio 2019 | Package Distribution Wizard

From the Distribution Type panel, you can select the distribution method you want to use. You can choose one of the following distribution methods:

Table 20-6 • Package Distribution Wizard Distribution Types

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Center Configuration Manager</td>
<td>The Package Distribution Wizard will publish the selected package to Microsoft System Center Configuration Manager. See Publishing Packages to Microsoft System Center Configuration Manager.</td>
</tr>
<tr>
<td>ZENworks Configuration Management Distribution</td>
<td>Create an MSI distribution object to distribute on ZENworks Configuration Management. See Preparing for ZENworks Configuration Management Distribution.</td>

<td>Enter a User Name to log onto the server entered in the Altiris Server Location field. The Distribution Wizard remembers the last User Name that is entered and displays it the next time this panel is accessed.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password to log onto the server entered in the Altiris Server Location field.</td>
</tr>
</tbody>
</table>

Click Next to proceed to the Package Information panel.

Altiris XML Template

AdminStudio 2019 | Distribution Wizard

When using the Altiris distribution method, a custom script file is required. If you select the Altiris method on the Distribution Type Panel, the Distribution Wizard uses an XML Template file (AltirisTemplate.config) to create a custom script file named <packageName>.Config. The Distribution Wizard copies this configuration file along with the Windows Installer package with any transforms and files to the Network Directory specified on the Altiris Integration Panel.

You can edit AltirisTemplate.config to customize it for your organization. The file, which is installed with AdminStudio, is located in the Templates subdirectory of the following directory:

[AdminStudioInstallDirectory]\AdminStudio Shared
The following variables are used in the `AltirisTemplate.Config` file:

**Table 20-11 • AltirisTemplate.config Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>%DIST.AVERSION%</td>
<td>AdminStudio version number</td>
</tr>
<tr>
<td>%DIST.COMMANDLINE%</td>
<td>Command line specified on the Altiris Integration Panel of the Distribution Wizard. See the Windows Installer Property Reference for more information.</td>
</tr>
<tr>
<td>%DIST.NETWORKLOCATION%</td>
<td>Network location of the MSI package as specified on the Altiris Integration Panel of the Distribution Wizard</td>
</tr>
<tr>
<td>%ProductCode%</td>
<td>ProductCode property from the MSI Property Table</td>
</tr>
<tr>
<td>%ProductName%</td>
<td>ProductName property from the MSI Property Table</td>
</tr>
<tr>
<td>%ProductVersion%</td>
<td>ProductVersion property from the MSI Property Table</td>
</tr>
<tr>
<td>%SUMMARYSTREAM.Id%</td>
<td>Comments property from the MSI Summary Stream. Any property with the SUMMARYSTREAM prefix will be populated based on the MSI Summary Information Stream Property as specified by the Id, in the format of: &lt;description&gt;%SUMMARYSTREAM.4%&lt;/description&gt; Summary Stream Ids range from 1 to 19. For a complete list of Summary Information Stream Ids, see Summary Information Stream Property Set. In the example above, &quot;4&quot; indicates that the value of the Author property should be inserted.</td>
</tr>
</tbody>
</table>

Please note the following:

- Any property with the DIST prefix will be custom populated by the Distribution Wizard.
- Any other property will be populated based on the MSI Property Table.
- Typically, all variables are enclosed within `%` characters, as shown above.

**Network Location Panel**

**AdminStudio 2019 | Package Distribution Wizard**

This panel is displayed when you choose the **Network Location** distribution method from the **Distribution Type** panel. The installation files will be copied to the network directory you specify (or browse to) in this panel.
### Package Information Panel

**AdminStudio 2019 | Package Distribution Wizard**

On the **Package Information** panel, you select the package that is ready for distribution.

**Table 20-12 • Package Information Panel Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Windows Installer Package (.msi) | Specify or browse to the package that you want to distribute:  
  - **If distributing to Microsoft System Center Configuration Manager**—You can select a Windows Installer (.msi), App-V 4.x (.sft), or legacy setup (.exe) package.  
  - **All other distribution types**—You can select only a Windows Installer (.msi) package.  
If you launched the Package Distribution Wizard from the Application Manager by right-clicking on a package and selecting Distribute Package from the shortcut menu, the package name in this field is already entered. The ability to edit this entry depends upon whether the package you are distributing is managed by the Software Repository:  
  - **Not in the Software Repository**—The full name and path of the file is displayed, and you can edit this entry or click **Browse** and select a different package.  
  - **In the Software Repository**—Only the name of the file is displayed (not the full path) and this entry cannot be edited or changed. |
| Windows Installer Transform Files (*.mst) | (Windows Installer packages only) In this area:  
  - If there are transforms associated with the package, click the New button and navigate to the transform you want to add.  
  - Use the Up and Down arrows to set the order in which the transforms are applied to the package.  
  - Use the Delete button to delete a transform from the list. |
| Specify Additional MSI Properties | (Windows Installer packages only) If desired, enter additional Windows Installer properties. |

Click **Next** to proceed.

### Distribution Summary Panel

**AdminStudio 2019 | Package Distribution Wizard**

The **Distribution Summary** panel displays a summary of all settings configured in the previous panels. When you click **Next**, the distribution begins and the **Distribution Output** panel is displayed.
Caution • The distribution will overwrite the contents of the distribution folder.

Distribution Output Panel

AdminStudio 2019 | Package Distribution Wizard

The Distribution Output panel displays a progress bar and status messages during distribution. When distribution is successful, a message appears and the background color of the output window turns green. If errors are encountered, the background color of the output window turns red.

![Distribution Output Panel](image)

Figure 20-7: Distribution Output Panel

Click Finish to exit the Wizard.

Note • For all distribution types, the Package Distribution Wizard will create a Distribution log file in the Distribution folder of the AdminStudio Shared directory.

Distribution Wizard for ZENworks Configuration Management

AdminStudio 2019 | Distribution Wizard for ZENworks Configuration Management

Novell ZENworks Configuration Management 10 and 11 customers can use the Distribution Wizard for ZENworks Configuration Management to distribute a Windows Installer package (.msi)—including any associated transforms—to ZENworks Configuration Management.

The Distribution Wizard for ZENworks Configuration Management consists of the following panels:

- Welcome Panel
Welcome Panel

AdminStudio 2019 | Distribution Wizard for ZENworks Configuration Management

You can use the Distribution Wizard for ZENworks Configuration Management to prepare a Windows Installer package (.msi)—including any associated transforms—for distribution on ZENworks Configuration Management.

If you do not want this panel to be displayed each time you open this wizard, select the **Do not show the Welcome panel again** option. If this option is selected, the **Login** panel will be the first panel opened for this wizard.

Click **Next** to continue.

**See Also**
Preparing for ZENworks Configuration Management Distribution

Login Panel

AdminStudio 2019 | Distribution Wizard for ZENworks Configuration Management

On the **Login** panel, enter the login information for the ZENworks Configuration Management server that you want to distribute packages on, and click **Login** to proceed with the distribution process.

Enter the following information:

**Table 20-13 • ZENworks Configuration Management Server Login Information**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>Enter a valid User Name for the ZENworks Configuration Management server where you want to distribute packages</td>
</tr>
<tr>
<td>Password</td>
<td>Enter a valid Password for the ZENworks Configuration Management server where you want to distribute packages</td>
</tr>
</tbody>
</table>
Windows Installer Package Information Panel

On the **Windows Installer Package Information** panel, enter the information that will be referenced by this ZENworks server bundle, and click **Next** to continue.

Enter the following information:

**Table 20-14 • Windows Installer Package Information Panel Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Windows Installer Package file (.msi)</strong></td>
<td>Click <strong>Browse</strong> and select the Windows Installer (.msi) package that you want to distribute.</td>
</tr>
<tr>
<td><strong>Windows Installer Transform Files (.mst)</strong></td>
<td>All of the .mst files that are in the same directory as the selected Windows Installer package are automatically listed in this list.</td>
</tr>
</tbody>
</table>

To include transforms with the Windows Installer package, click the New button ( ) and select a transform. If the package requires multiple transforms, you can repeat the procedure as necessary.

Use the Delete button ( ) to delete the selected transform from the list.

**Note** • All of the .mst files that are in the same directory as the selected Windows Installer package are automatically listed in this list even if they are not applicable to the selected package. To prevent the inclusion of non-applicable transform files, delete those transforms from the list.
Chapter 20  Distributing Applications and Packages

Reference

Table 20-14 • Windows Installer Package Information Panel Properties (cont.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install Parameters</td>
<td>You can customize how this package is installed by entering parameters in this field. These parameters are applied to msiexec.exe to perform the desired action. Any actions that you enter here will be performed whenever the bundle is installed. The root parameter, which should not be edited or deleted, is: /i packagename.msi By default, the /qn parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input. <strong>Caution</strong> • If this operation requires user input, either remove the /qn parameter, or create a response transform to preconfigure all user input. For more information, see Using Response Transforms. <strong>Note</strong> • For additional parameters that can be added, see Additional Install, Uninstall, and Repair Parameters.</td>
</tr>
<tr>
<td>Uninstall Parameters</td>
<td>Enter an action that will be performed whenever the bundle is uninstalled. The root parameter, which should not be edited or deleted, is: /x packagename.msi By default, the /qn parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input. <strong>Caution</strong> • If this operation requires user input, either remove the /qn parameter, or create a response transform to preconfigure all user input. For more information, see Using Response Transforms. <strong>Note</strong> • For additional parameters that can be added, see Additional Install, Uninstall, and Repair Parameters.</td>
</tr>
</tbody>
</table>
**Repair Parameters**

Enter an action that will be performed whenever the user chooses to repair the bundle by repairing or reinstalling missing or corrupted files.

The root parameter, which should not be edited or deleted, is:

```
/f packagename.msi
```

By default, the `/qn` parameter is added to indicate that you want to perform this operation silently (with no user interface). This is the common operating behavior for installing software with ZENworks. Running an operation silently implies that it does not require any user input.

**Caution** • If this operation requires user input, either remove the `/qn` parameter, or create a response transform to preconfigure all user input. For more information, see Using Response Transforms.

You can also apply any of the following additional parameters after the package name:

- **p** – Reinstalls a file if it is missing
- **o** – Reinstalls a file if it is missing or if an older version of the file is present on the user's system
- **e** – Reinstalls a file if it is missing or if an equivalent or older version of the file is present on the user's system
- **c** – Reinstalls a file if it is missing or if the stored checksum of the installed file does not match the new file’s value
- **a** – Forces a reinstall of all files
- **u** or **m** – Rewrite all required user registry entries
- **s** – Overwrites any existing shortcuts
- **v** – Runs your application from the source and re-caches the local installation package

**Note** • For additional parameters that can be added, see Additional Install, Uninstall, and Repair Parameters.
### Additional Install, Uninstall, and Repair Parameters

The following additional parameters can be entered in the Parameters fields.

**Table 20-15 • Additional Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/j [u</td>
<td>m] packagename.msi</td>
</tr>
<tr>
<td>/j [u</td>
<td>m] packagename.msi /t &lt;transform list&gt;</td>
</tr>
<tr>
<td>/j [u</td>
<td>m] packagename.msi /g</td>
</tr>
<tr>
<td>/j &lt;language ID&gt;</td>
<td>Building with the /j &lt;package&gt; option advertises the components of your application on the end user's computer</td>
</tr>
<tr>
<td>/j &lt;language ID&gt;</td>
<td></td>
</tr>
<tr>
<td>/L [i]w[e]a[r</td>
<td>u</td>
</tr>
<tr>
<td>/L [i]w[e]a[r</td>
<td>u</td>
</tr>
<tr>
<td>/L [i]w[e]a[r</td>
<td>u</td>
</tr>
</tbody>
</table>

- **u** – Advertises components only to the current user
- **m** – Advertises components to all users of the computer
- **g** – Specifies language ID
- **t** – Applies a transform to your advertised product

Transforms allow the synchronization of applications across different languages. For example, if you upgrade the English version of your product, you could apply a transform to automatically upgrade the French version of your product.

- **i** – Logs status messages
- **w** – Logs non-fatal warning messages
- **e** – Logs any error messages
- **a** – Logs the commencement of action sequences
- **r** – Logs action-specific records
- **u** – Logs user requests
- **c** – Logs initial user interface parameters
- **m** – Logs out-of-memory messages
- **p** – Logs terminal settings
- **v** – Logs the verbose output setting
- **+** – Appends to an existing file
- ***” – Is a wildcard character that allows you to log all information (excluding the verbose output setting)
Table 20-15 • Additional Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| /q [n|b|r|f]        | The /q option is used to set the user interface level in conjunction with the following flags:  
|                   | • q or qn – Creates no user interface  
|                   | • qb – Creates a basic user interface  
|                   | The user interface settings below display a modal dialog box at the end of installation:  
|                   | • qr – Displays a reduced user interface  
|                   | • qf – Displays a full user interface  
|                   | • qn+ – Displays no user interface  
|                   | • qb+ – Displays a basic user interface  
| /y <filename>     | This command calls the DllRegisterServer entry-point function of the DLL or OCX file specified in <filename>. |
| /z <filename>     | This command calls the DllUnregisterServer entry-point function of the DLL or OCX file specified in <filename>. |
| TRANSFORMS        | Use the TRANSFORMS command-line parameter to specify any transforms that you would like applied to your base package. Your transform command-line call might look something like this:  
|                   | msiexec /i "C:\Directory\ProductName.msi" TRANSFORMS="New Transform 1.mst"  
|                   | You can separate multiple transforms with a semicolon. Because of this, it is recommended that you do not use semicolons in the name of your transform, as the Windows Installer service will interpret those incorrectly. |
| Properties        | All public properties can be set or modified from the command line. Public properties are distinguished from private properties by the fact that they are in all capital letters. For example, COMPANYNAME is a public property.  
|                   | To set a property from the command line, use the following syntax:  
|                   | PROPERTY=VALUE.  
|                   | If you wanted to change the value of COMPANYNAME, you would enter:  
|                   | msiexec /i "C:\Directory\ProductName.msi" COMPANYNAME="YourCompany"

Generating and Viewing AdminStudio Reports

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

You can use Reports to obtain a centralized view of all of the information regarding packages in your AdminStudio Application Catalog. Because Reports is a Web application, it can be easily accessed by a geographically dispersed workforce without requiring any software installation or data transfer. Reports makes it easy to get the application data you need to diagnose and repair software problems and to manage applications across your organization.

A catalog-level search tool enables you to generate detailed, custom reports on packages with particular characteristics. These reports are accessible anywhere via a Web interface and can be exported to PDF or Excel format for sharing and archiving.

Information on generating and viewing AdminStudio reports in Reports is presented in the following sections:

Table 21-2 • Information About Generating AdminStudio Reports

<table>

Viewing Package Reports

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

Note • In Workflow Manager, Package reports can be viewed by users in both Administrator and Consumer companies.

You can generate AdminStudio Package Reports on the Search Packages page, which is opened by clicking Search Packages on the Reports menu of the navigation bar.

On the Search Packages page you can perform a search of all of the applications in the Application Catalog to locate the package you would like to generate a report for.

- Searching for a Package on the Search Packages Page
- Information Included in Package Reports
- Navigating Through a Package Report
- Archiving a Package Report
- Exporting a Package Report

Searching for a Package on the Search Packages Page

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

By default, all of the packages in the connected AdminStudio Application Catalog are listed on the Search Packages page. However, you can filter the list of packages displayed in the package tree to display only those packages that meet specific search criteria. The search criteria are grouped into three categories:
• **Package Attributes**—Search by common properties assigned to packages. See Package Attributes.

• **Package Content**—Search by files, registry entries, .ini files, or shortcuts contained in the package. See Package Content.

• **Workflow Request Attributes**—Search by information related to a package’s associated workflow request. See Workflow Request Attributes.

To filter the list of packages displayed in the package tree to display only those packages that meet specific search criteria, perform the following steps.

**Task**  
**To search for a package on the Search Packages page:**

1. In the Search Packages area of the Search Packages page, expand the criteria category that you want to use by clicking the arrow. When all three categories are expanded, the following fields are available:

![Search Packages](image)

2. Enter values in the criteria fields that you want to search on. You can search for packages in the Application Catalog based on metadata in three categories:

   • **Package Attributes**—Search by properties assigned to the package. See Package Attributes.

   • **Package Content**—Search by files, registry entries, .ini files, or shortcuts contained in the package. See Package Content.

   • **Workflow Request Attributes**—Search by information related to a package’s associated workflow request. See Workflow Request Attributes.
3. After you have entered the search criteria, click **Search**. The packages that meet the criteria are now listed.

**Package Attributes**

You can search for packages in a catalog based on one or more of any of the following package attribute metadata:

**Table 21-3 • Package Attribute Search Fields**

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Package Code** | Enter the GUID that identifies a particular Windows Installer .msi package. The Package Code associates an .msi file with an application or product and is represented as a string GUID—a text string that has a special format:  
{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}  
where each X character is a hex digit (0 through 9 or uppercase A through F). |
| **Product Code** | Enter the GUID that uniquely identifies the particular product release of a package. The ProductCode is a Windows Installer property and is represented as a string GUID—a text string that has a special format:  
{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}  
where each X character is a hex digit (0 through 9 or uppercase A through F). |
| **Upgrade Code** | Enter the GUID that identifies the family of products that are in the same upgrade path. The UpgradeCode is a Windows Installer property and is represented as a string GUID—a text string that has a special format:  
{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXsXXXXX}  
where each X character is a hex digit (0 through 9 or uppercase A through F). |
| **Setup File Name** | Name of the file that was imported into the Application Catalog. |
| **Comments**     | Enter the text of any comments associated with the package. |
| **Extended Attributes** | Enter the value of any of the Extended Attributes associated with the package. |
Chapter 21  Generating and Viewing Reports
Generating and Viewing AdminStudio Reports

Package Content
You can search for packages in a catalog based on one or more of any of the following Package Content metadata

Table 21-4 • Package Content Search Fields

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>Enter the file name of one of the files in the package.</td>
</tr>
<tr>
<td>Registry Key</td>
<td>Enter a registry key to search on.</td>
</tr>
<tr>
<td>Registry Value</td>
<td>Enter a registry value to search on.</td>
</tr>
<tr>
<td>INI File</td>
<td>Enter any changes to an .ini file that are made when the product is installed.</td>
</tr>
<tr>
<td>Shortcut</td>
<td>Enter the name of a shortcut that is created when the product is installed.</td>
</tr>
</tbody>
</table>

Workflow Request Attributes
You can search for packages in a catalog based on one or more of any of the following attributes of the package’s associated workflow request:

Table 21-5 • Workflow Request Attributes Search Fields

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the package’s associated workflow request.</td>
</tr>
<tr>
<td>Upload Date</td>
<td>Enter the date the workflow request was created.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Enter the date the workflow request is scheduled to be completed, based upon its value for Application Due Period.</td>
</tr>
<tr>
<td>Risk Date</td>
<td>Enter the date at which the workflow request’s status will change to At Risk, which is based upon its value for Application At Risk Period.</td>
</tr>
<tr>
<td>Due Period</td>
<td>Enter, in days, the length of time this workflow request needs to be completed in order to meet its project’s Service Level Agreement (SLA) requirements.</td>
</tr>
<tr>
<td>End Date</td>
<td>Enter the date the workflow request was completed.</td>
</tr>
</tbody>
</table>

Information Included in Package Reports
AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

A Package Report lists detailed package information for packages of the following deployment types:
• Microsoft Windows Installer packages
• Microsoft App-V virtual packages
• Apple iOS mobile apps (local and public store)
• Google Android mobile apps (local and public store)

In a Package Report, the information is presented in a tabbed interface, as described in Navigating Through a Package Report. A Package Report includes the following major sections:

• Package Summary Information View
• Files View
• Registry View
• Shortcuts View
• ODBC Drivers View
• ODBC DS View
• Extended Attributes View
• Validation View
• Conflicts View
• History View
• Dependencies View
• Properties View

Package Reports for mobile apps only include the Files View, Properties View, and History View.

Package Summary Information View

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The initial view (Page 1) of a Package Report is the Package Summary Information view.
Figure 21-1: Package Report / Package Summary Information View

The Package Summary Information View lists the following information:

Table 21-6 • Package Report / Package Summary Information

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Name</td>
<td>Name assigned to the package.</td>
</tr>
<tr>
<td>Manufacturer</td>
<td>Company that authored the package.</td>
</tr>
<tr>
<td>Import Date</td>
<td>The date and time the package was imported into the Application Catalog.</td>
</tr>
<tr>
<td>Unresolved Conflicts</td>
<td>The number of detected conflicts, generated during conflict analysis of this package, which have not yet been resolved—either automatically or manually.</td>
</tr>
<tr>
<td>Product Version</td>
<td>Version of package that is recorded in the package’s Windows Installer file.</td>
</tr>
<tr>
<td>Product Language</td>
<td>Decimal-based code identifying the language that this software package was authored for. For example, English is 1033, German is 1031, and Japanese is 1041.</td>
</tr>
<tr>
<td>In Software Repository</td>
<td>Indicates whether or not this package and its associated files are managed by the Software Repository.</td>
</tr>
</tbody>
</table>
Files View

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The Files view lists all of the files included in the selected package, and the location where these files will be installed.

![Figure 21-2: Package Report / Files View](image)

For each file, the following information is listed:

**Table 21-7 • Package Report / Files Information**

<table>

ODBC Drivers View
AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The ODBC Drivers view lists all of the Open Database Connectivity (ODBC) drivers in the package.
ODBC Resources are ones that involve interaction with databases. ODBC drivers are libraries that implement functions involving ODBC. Each database type has its own ODBC driver.

**Figure 21-5:** Package Report / ODBC Drivers View

For each ODBC driver, the following information is listed:

**Table 21-10** Package Report / ODBC Drivers Information

<table>
<thead>
<tr>
<th>Item</th>

Navigating Through a Package Report

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.
The Package Report consists of the initial Package Summary View and 10 other multi-page views which are accessed by clicking the links at the top of the report:

**Figure 21-13:** Navigation Links on the Package Report

**Scrolling Through Pages of a View**

Each of the Package Report views can be either a single page or multi-page, depending upon the content. The Package Report window is not resizable, so you cannot enlarge the window to display more items. Instead, you can use the Page Scrolling controls in the toolbar.

**Figure 21-14:** Page Scrolling Controls on Package Report

The total number of pages of the Package Report is listed in the toolbar, along with the number of the page that you are currently viewing. To jump to a specific page, enter a number in the box and click **Enter**.

Page 1 of the Package Report is the **Package Summary Information** view. Following this view, the rest of the views follow in the order in which they appear in the navigation links. The total number of pages in a Package Report is determined by adding the number of pages of all of the different views together.

**Using Zoom Capability to Modify the Report Size**

You can make selections from the Zoom list in the tool bar to enlarge or decrease the size of the report.
Chapter 21  Generating and Viewing Reports

Generating and Viewing AdminStudio Reports

Figure 21-15: Zoom List on the Package Report

Note • When you use the Zoom list to change the size of a Package Report, the size of the font used in the text is increased or decreased; however, the amount of information displayed on one page does not change.

Searching for Information in a Package Report

You can use the Find box in the Package Report tool bar to search for specific information in the Package Report.

Task  To search a Package Report:

1.  In the Package Report toolbar, enter the text you want to search for in the Find box and click Find. The page containing the first instance of that text is opened, and the text you searched for is highlighted.

2.  Click Next in the tool bar to find the next instance of the text.
Archiving a Package Report

Archiving a Package Report

**Edition** • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

You can archive a Package Report to document a snapshot of a package's information as of a specific date and time.

Package Reports are saved in PDF format, and therefore can be easily distributed. An archived report looks very similar to the original report, except that it is a multiple-page PDF:

![Archived Package Report](image)

**Figure 21-16**: Archived Package Report

**Note** • In an archived Package Report PDF, the navigation links at the top of the report (Files, Registry, Shortcuts, etc.) are not active. To scroll through the PDF, use the standard Adobe Reader controls.

To archive a Package Report, perform the following steps.

**Task** To archive a Package Report:

1. Open a Package Report.
2. Click the Archive Report link in the lower left corner any of the Package Report pages. The report is archived in PDF format and the following message is displayed:

   The report has been archived.
3. Click the Reports All Reports tab. The All Reports page opens, and the report that you just archived is listed.

   
   Note • Each user’s Archived Reports list only includes those reports that they archived. If you want others in your organization to view an archived report, you need to distribute the PDF via email or other delivery method.

4. Click View next to the Package Report that you want to view. The report is opened in a PDF browser.

Deleting an Archived Package Report from the Archived Reports List

To delete an archived Package Report, perform the following steps.

   
   Task To delete an archived Package Report from the Archived Reports list:

1. In the Archived Reports list on the All Reports page, right-click on the archived report you want to delete, and then click Delete. You are prompted to confirm the deletion.

2. Click OK. The archived report is deleted.

Exporting a Package Report

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

You can export the contents of a Package Report to an Excel (.xls) or Acrobat (.pdf) file, or Microsoft Word (.doc) file.

- Excel .xls file—When a Package Report is exported to Microsoft Excel format, each of the Package Report views are displayed on a different worksheet.

- Acrobat .pdf file—An exported Package Report in PDF format is the same as the PDF created when a Package Report is archived. See Archiving a Package Report.

- Word (.doc) file—The Package Report is exported in Microsoft Office Word 97 - 2003 format.

To export a Package Report, perform the following steps.

   
   Task To export a Package Report:

1. In the Package Report tool bar, click on the Export icon.

2. Select Excel or PDF, or Word from the list.

   
   One the following occurs:
If you selected Excel or Word, the File Download dialog box opens. Click Save and select a location for the exported file on the Save As dialog box.

If you selected PDF, the PDF will open in a new browser window.

Generating a Custom SQL Query Report for AdminStudio

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

You can generate a Custom SQL Query Report to include data generated by both AdminStudio and Workflow Manager. To generate a Custom SQL Query Report, perform the following steps.

Task To generate a new Custom SQL Query report:

1. In the navigation bar, click Create Custom SQL Query Report on the Reports menu. The Step 1: Enter SQL Query panel of the Create Custom SQL Query Report page opens.

2. Enter an SQL query to retrieve the data for this report. Click the Test Query button to verify the query syntax.

   Tip • To assist you in writing queries to retrieve data, see Wildcard Support in Reports SQL Queries.

3. Click Next. The Step 2: Specify general information panel opens.
4. Enter a **Report name** and **Description** to clearly identify the contents and purpose of this report. This name and description will be listed on the **All Reports** page.

5. Select the roles that you want to have permission to view this report.

6. Click **Next**. The **Step 3: Save and preview report** page opens, which displays all the information needed to create the report.
7. Click **Save and preview**. The report is generated. This report is also saved and now appears in the list on the **All Reports** page.
Wildcard Support in Reports SQL Queries

In Reports searches, the LIKE operator is always used. You can combine the LIKE operator with a wildcard character, and the following rules apply:

Table 21-17 • Wildcard Support in Reports Queries

<table>
<thead>
<tr>
<th>Situation</th>
<th>Rule</th>
</tr>
</thead>
</table>
| **When no wildcards are used** | If you do not enter a wildcard character in the Search box, then Reports performs a “LIKE” search, which searches for any occurrence of that text anywhere in the item that is being searched for.  
For example, if you are searching for a file name that has the word test anywhere in the file name, and you entered test in the Search box, it would be interpreted by Reports as:  
*test*  
And the following files would be found:  
MyTestFile and TestFile |
| **When wildcards are used**   | You can specify a * wildcard in the Search box to narrow the search results.  
For example, if you are searching for a file name that includes the word test, but does not begin with it, and you entered *test in the Search box, MyTest would be returned, but not TestFile. |
Generating a Custom Stored Procedure Report for AdminStudio

You have the option of generating an AdminStudio Enterprise Server report using a stored procedure. A Custom Stored Procedure Report is a report on data generated by AdminStudio that is defined by specifying a stored procedure.

- Generating a New Custom Stored Procedure Report
- Sample Custom Stored Procedure Report

Generating a New Custom Stored Procedure Report

To generate a Custom Stored Procedure report, perform the following steps.

**Task**

To generate a Custom Stored Procedure report:

1. Open the `AMS_CustomReports` table and enter the names of the stored procedures you want to use to generate reports.

   *Note* • For more information on stored procedures, see SQL Stored Procedures in Microsoft TechNet.

![Create Custom Stored Procedure Report](image)

   The contents of this panel is determined by the selected stored procedure.

   *Note* • This panel is customizable per customer need. The filters shown on the screen are based up on the parameters required by the stored procedure.

3. Select a stored procedure from the list and specify any other requested information.
4. Click Next. The Step 2: Specify general information panel opens.

5. In the Report name field, enter a name to identify this report. This name will be listed on the All Reports page.

6. Enter a Description to identify the purpose of this report.

7. In the Roles section, select those roles that you want to assign permission to view this report.

8. Click Next. The Step 3: Save and preview report panel opens.
9. Click **Save and preview**. The report is displayed.

The report is now saved and available to view by users with appropriate permission.

**Sample Custom Stored Procedure Report**

A sample custom stored procedure report is shipped with Workflow Manager named `usp_GetReadOnlyWorkflows`. This report lists all of the workflow requests that are in “read-only” status due to a stopped SLA clock or having an open critical issue.

You can view this report by selecting **Create Custom Stored Procedure Report** from the **Reports** menu, and then selecting the `usp_GetReadOnlyWorkflows` from the **Stored procedure** list.

**See Also**
- Generating and Viewing AdminStudio Reports
- Select Stored Procedure Panel
Specifying Predefined Parameters in a Custom Stored Procedure Report

You can specify known predefined parameters in a stored procedure. When the report is displayed, it will include drop down lists that users can use to filter the data displayed in the custom report.

![Predefined Parameters Displayed in Custom Stored Procedure Report](image)

Figure 21-17: Predefined Parameters Displayed in Custom Stored Procedure Report

Workflow Manager ships with a default stored procedure named `usp_getreadonlyworkflows`. In this stored procedure, the following predefined parameters are supported:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>@ApplicationID</td>
<td>List of all the workflow request names.</td>
</tr>
<tr>
<td>@ApplicationID_Completed</td>
<td>List of all the workflow request names which are already completed.</td>
</tr>
<tr>
<td>@ApplicationID_InProgress</td>
<td>List of all the workflow request names which are in progress.</td>
</tr>
<tr>
<td>@CompanyID</td>
<td>For a consumer company, this will default to the company ID of the user's company. For an administrator company, this will default to the company ID of the user's company, but will also include the company IDs of corresponding client companies as well.</td>
</tr>
<tr>
<td>@ProjectID</td>
<td>List of all projects.</td>
</tr>
<tr>
<td>@ProjectID_Active</td>
<td>List of all active projects.</td>
</tr>
<tr>
<td>@TemplateID</td>
<td>List of all templates.</td>
</tr>
<tr>
<td>@UserID</td>
<td>List of all users based on CompanyID.</td>
</tr>
<tr>
<td>@WorkflowStatus</td>
<td>Values from [AMS_ApplicationStatus] table status.</td>
</tr>
</tbody>
</table>

Table 21-18 • Predefined Parameters

You can also edit an XML file named `StoredProcParams.xml` in the Workflow Manager installation directory to add additional parameters.
Figure 21-18: StoredProcParams.xml File

This file installed in the following location:

C:\AdminStudioWebComponents_2016\wwwroot\App_Data

In the StoredProcParams.xml file, the <Value> element is a select statement that will be used to populate the drop down list for that parameter.

Viewing AdminStudio Application Catalog Reports

AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

Note • In Workflow Manager, AdminStudio Application Catalog reports can be viewed by users in both Administrator and Consumer companies.

On the Application Catalog Dashboard page, you can view a wide array of reports containing summary information on the applications in your Application Catalog. These reports give you insight into the readiness of those packages for distribution and for conversion to virtual packages.

You open the Application Catalog Reports page by selecting Application Catalog Dashboard on the Reports menu of the navigation bar. You switch between reports by selecting the report name from the Select Report list.

For example, Application readiness Dashboard report is opened and shown in below figure.
Figure 21-19: Application Readiness Dashboard Report

The available reports include test results from operating system compatibility, browser compatibility, virtualization compatibility, remote application publishing compatibility, best practices testing, and application conflict testing. For Mac OS, Apple iOS, Google Android, and Microsoft Windows Phone mobile apps, reports on feature use, risk assessment, device compatibility, and/or policy compatibility are available. Reports are also included on App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.

For most reports, detailed sub-reports are available by clicking on one of the categories of the pie bar chart, on one of the numbers in an issue count column, or on a package name. Click on the available hyperlinks until you have explored all of the levels of the report.

For more information, see Viewing Application Testing and Analysis Reports on the Reports Tab in the AdminStudio Help Library.
Generating and Viewing Workflow Manager Reports

AdminStudio 2019 | Reports

Edition • This feature is available in Workflow Manager only.

Both workflow consumers and administrators can generate reports. All reports can be filtered by many common fields (such as project, company, and so on), and you can also export reports to many different formats, including PDF, RTF, XLSX, and CSV.

This section includes topics on the following:

- Generating Standard Reports
- Creating Custom Reports
- Exporting Report Data from Reports

Note • You must be a Workflow Administrator with Administrative permissions to create a Report.

Reports Reference

Generating Standard Reports

AdminStudio 2019 | Reports

Edition • This feature is available in Workflow Manager only.

Workflow administrators can open five system reports from the All Reports page. These reports provide you with detailed summary information about a company’s projects and workflow requests.
All Reports

Select one of the saved reports below to view:

- **Projects Report** — A report that groups projects by customer and returns summarized information including the progress and Service Level Agreement (SLA) status of workflow requests. You can choose to return information about one project or all of a company’s projects. See *Generating a Projects Report*.

- **Workflow Requests Summary Report** — A report that lists all of a company’s workflow requests, displaying the SLA status and workflow progress of each request. You can filter this report by SLA status. See *Generating a Workflow Requests Summary Report*.

- **Request Detail Report** — A report that lists information on workflow requests for a specific project. See *Generating a Request Detail Report*.

- **Project SLA Report** — A report that measures and reports on the SLA status for a specific project, or for all projects, during a specific date range. See *Generating a Project SLA Report*.

- **Workflow Phases SLA Report** — A report that lists all workflow phases for which phase-level SLA tracking is being performed along with their SLA Status. See *Generating a Workflow Phases SLA Report*.

- **Workflow Steps SLA Report** — A report that lists all workflow steps for which step-level SLA tracking is being performed along with their SLA Status. See *Generating a Workflow Steps SLA Report*.

**Opening a System Report**

You can open all of these System Reports from either the All Reports page or by selecting them on the Reports menu of the navigation bar.
Generating and Viewing Reports

Generating and Viewing Workflow Manager Reports

Task To open a System Report:

1. Click on a report name on the Reports menu of the navigation bar.
2. Follow the instructions in one of the following topics:
   - Generating a Projects Report
   - Generating a Workflow Requests Summary Report
   - Generating a Request Detail Report
   - Generating a Project SLA Report
   - Generating a Workflow Phases SLA Report
   - Generating a Workflow Steps SLA Report

Setting View Permissions for the Projects or Workflow Requests Summary Reports

You can specify which roles at your company are able to view the Projects and the Workflow Requests Summary reports.

Task To set view permissions:

1. On the All Reports page, click the Edit icon Projects Report or Workflow Requests Summary Report. The report’s information panel opens, listing all of the roles for both the Workflow Consumer and Workflow Administrator company.
2. Select the roles that you want to be able to view the selected report.
3. Click Save.

Generating a Projects Report

Edition • This feature is available in Workflow Manager only.

A Projects Report groups projects by customer and returns summarized information including the progress and Service Level Agreement (SLA) status of workflow requests. You can choose to return information about one project or all of a company’s projects.

Task To view a Projects Report:

2. Select the company that you want to report on from the Company list.
3. Choose one of the company’s projects from the Projects list, or select **View for all** to return information about all of a company’s projects.
4. To return only workflow requests with specific SLA Status values, choose one or more of: Completed On Time, Completed Late, On Time, At Risk, or Late. Select all of these if you want to report on all workflow requests.

See Also
Projects Report

 Generating a Workflow Requests Summary Report

To view a Workflow Requests Summary Report:

2. From the Company list, select the company that you want to view a report on.

3. Select one of the following options to specify which requests to include in this report:
   - **Single Workflow Request**—Select this option to return information about only one workflow request, which you select from the associated combo box.
   - **Multiple Workflow Requests**—Select this option to return all workflow requests with specific SLA status values. Choose one or more of Completed On Time, Completed Late, On Time, At Risk, or Late to indicate which workflow requests you wish to return. Select all of these options to return all workflow requests associated with a project

4. If you chose to generate a report about a single workflow request, the Additional Metadata Filter Conditions check box becomes visible. Select this check box to return filter your report by the values provided by people as they complete the data elements in a workflow request. If you select the checkbox, the metadata filter fields appear, and you should do the following:
   a. Select the data element that you want to filter by from the Metadata Field list.
   b. Enter a value for the selected Metadata Field in the Condition Value box, or select a value from the Values List (when available).
   c. Select the appropriate Operator from the list (AND or OR).
   d. Continue adding Metadata Fields, if desired. You can filter by up to four fields.

Generating a Request Detail Report

AdminStudio 2019 | Reports

Edition • This feature is available in Workflow Manager only.

A Request Detail Report groups workflow requests by project, and presents information on their progress and Service Level Agreement (SLA) status.

You can choose to return information about workflow requests for one project or for all of the projects of a company.

Task To view a Request Detail report:

2. From the Company/Business Unit Name list, select the company that you want to view a report on. You can also select **View for all**.
3. From the Template list, select a template. You can also select **View for all**.
4. From the Project list, select a template. You can also select **View for all**.
5. From the Date Range From and Date Range To lists, specify the date range that you want the report to cover.

See Also
Request Detail Report

Generating a Project SLA Report

AdminStudio 2019 | Reports

Edition • This feature is available in Workflow Manager only.

You can generate a Project SLA Report to measure and report on the SLA status for a specific project, or for all projects, during a specific date range. This helps you analyze the delivery time for any completed project, and identify bottlenecks and weak points in your process.

Using this report, you can view projects within a specific date range, and then drill down from project level to workflow requests across both phases and steps to see the SLA status at each level.
Task

To generate a Project SLA Report:

1. Click **Project SLA Report** on the **Reports** menu on the navigation bar. The **Project SLA Report** page opens.
2. From the **Template** list, select the name of the Workflow Template used by the project or projects that you want to view SLA information for.

   **Important** • To generate a report that lists SLA data for all projects during a specific date range, do not make a selection from the **Template** list.

3. For the **Data Range From** and **Date Range To** fields, identify the date range for which you want to view project data.
4. Click **View Report** to generate the Project SLA Report.

5. Click the plus signs to expand the listing to view SLA data across phases and steps for a specific project.
6. To view SLA information on a specific workflow request, click the hyperlinked **Request Name** to open the **SLA Details by Phase and Workflow Step Subreport** for that workflow request.

**SLA Details by Phase and Workflow Step Subreport**

The **SLA Details by Phase and Workflow Step** report lists SLA data for a specific workflow request.

Task

To open an SLA Details by Phase and Workflow Step report:

1. Open a Project SLA Report, as described in **Generating a Project SLA Report**.
2. Click the plus signs to expand the listing until you can view the SLA data for a specific workflow step. Workflow requests that contain that workflow step are listed.
3. Under the expanded workflow step, click the hyperlinked Request Name to open the SLA Details by Phase and Workflow Step Subreport for that workflow request.

4. To view the SLA data for other workflow steps in that workflow request, use the plus signs to expand the listing.

See Also
Project SLA Report

Generating a Workflow Phases SLA Report

AdminStudio 2019 | Reports

Edition • This feature is available in Workflow Manager only.

A Workflow Phases SLA Report lists all workflow phases for which step-level SLA tracking is being performed along with their SLA Status. SLA (Service Level Agreement) time tracking is used to determine the status of a workflow phase (or workflow request) in relationship to its SLA due date as either: In Progress, On Time, At Risk, Late, Completed on Time, or Completed Late.

Note • For information on enabling workflow-phase level SLA tracking, see “Tracking a Workflow Request or Workflow Phase’s SLA Status” in the Workflow Manager Help Library.

Task To generate a Workflow Phases SLA Report:

2. To display the SLA status of workflow steps from all workflow requests, even those that have been completed, clear the selection of the Only include Workflow Phases in active Workflow Requests option and click Refresh Report.
Generating a Workflow Steps SLA Report

A Workflow Steps SLA Report lists all workflow steps for which step-level SLA tracking is being performed along with their SLA Status. SLA (Service Level Agreement) time tracking is used to determine the status of a workflow step (or workflow request) in relationship to its SLA due date as either: In Progress, On Time, At Risk, Late, Completed on Time, or Completed Late.

Note • For information on enabling workflow-step level SLA tracking, see “Tracking a Workflow Request or Workflow Step’s SLA Status” in the Workflow Manager Help Library.

To generate a Workflow Steps SLA Report:

2. To display the SLA status of workflow steps from all workflow requests, even those that have been completed, clear the selection of the Only include Workflow Steps in active Workflow Requests option and click Refresh Report.

Creating Custom Reports

You can create the following types of custom reports using the Reports Wizard:

- **Custom Report**—A custom report defined by using the Reports Wizard. See Creating a Custom Report.
- **Activity Report**—A custom report, which you define using the Report Wizard, that displays a listing of activities that occur during the completion of a request. See Creating an Activity Report.
- **Custom SQL Query Report**—A custom report defined by entering an SQL query in the Report Wizard. See Generating a Custom SQL Query Report.

Additional information is provided in this section that may help you generate custom reports:

- **Wildcard Support in Reports SQL Queries**—You can combine the SQL LIKE operator with wildcard characters to perform searches. See Wildcard Support in Reports SQL Queries.
- **Sample SQL Queries Used to Generate Project and Workflow Request Reports**—Sample SQL queries that are used to generate the built-in Project and Workflow Requests reports are provided. These sample queries might be helpful.
to refer to when you are creating your own custom reports. See Sample SQL Queries Used to Generate Project and Workflow Request Reports.

Creating a Custom Report

To create a new custom report, perform the following steps.

<table>
<thead>
<tr>
<th>Task</th>
<th>To create a new report:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>In the navigation bar, click Create Custom Workflow Manager Report on the Reports menu. The Step 1: Select report objects panel of the Create Custom Workflow Manager Report page opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Select the objects that you would like to include in the report and click Next. The Select report fields panel opens, listing all of the defined fields by object type. Only the objects that you selected in the previous step will be listed.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the report fields that you would like to include in the report and click Next. The Select report filters panel opens, where you can filter the data that you want to appear in the report.</td>
</tr>
<tr>
<td>4.</td>
<td>Click on a field in the tree and set its filter on the right side using the drop-down boxes and the text box, selecting appropriate logical conditions which are populated according to the selected field. Each time you create a filter, click Add to add the filter to the current filter conditions.</td>
</tr>
<tr>
<td></td>
<td>Note • Even though you may not have included all of the available report fields in this report, you can still filter the data using all of these report fields.</td>
</tr>
<tr>
<td>5.</td>
<td>Click Test to test the created query for your report.</td>
</tr>
<tr>
<td>6.</td>
<td>When you are satisfied with the filter conditions, click Next. The Templates panel opens, listing all available template data.</td>
</tr>
<tr>
<td>7.</td>
<td>Expand the templates in the tree and select the data that you want to include in the report. All of the data groups and data elements associated with the selected template are listed. To display only those templates that are in use in the Available Templates list, select the Templates in use only option.</td>
</tr>
<tr>
<td>8.</td>
<td>Click Next. The Specify general information panel opens.</td>
</tr>
<tr>
<td>9.</td>
<td>Enter a Report name and Description to clearly identify the contents and purpose of this report. This name and description will be listed on the All Reports page.</td>
</tr>
<tr>
<td>10.</td>
<td>Select the Administrator and Consumer roles that you want to have permission to view this report.</td>
</tr>
<tr>
<td>11.</td>
<td>Click Next. The Save and preview report panel opens, which displays all the information needed to create the report.</td>
</tr>
<tr>
<td>12.</td>
<td>Click Save and preview. The report is generated. This report is also saved and now appears in the list on the All Reports page.</td>
</tr>
</tbody>
</table>
Creating an Activity Report

Activities Displayed in the Activity Report

The Activity Report lists a record for each time one of the following activities occurs during the completion of a request:

Table 21-19 • Activities Listed in the Activity Report

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Name Change</td>
<td>Occurs when a user edits the Workflow Name field on the Properties tab of the Workflow Request page and clicks Update.</td>
</tr>
<tr>
<td>Request Status Changed</td>
<td>Occurs when a user edits the Status of a request on the Properties tab of the Workflow Request page and clicks Update.</td>
</tr>
<tr>
<td>Data Acceptance Begins</td>
<td>Occurs when a user clicks the Submit button after they have entered all of the initial data that is required for a request (the Data Entry Step of the first Workflow Phase).</td>
</tr>
<tr>
<td>Data Acceptance Cancel</td>
<td>Occurs when a Workflow Administrator clicks the Reject Data button to reject the data submitted during a request’s Data Entry Step.</td>
</tr>
<tr>
<td>Data Acceptance Complete</td>
<td>Occurs when a Workflow Administrator clicks the Accept Data button after reviewing the data submitted during a request’s Data Entry Step.</td>
</tr>
</tbody>
</table>

Note • This event occurs simultaneously with the Data Submission Complete event.

Edition • This feature is available in Workflow Manager only.
Table 21-19 • Activities Listed in the Activity Report (cont.)

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Changed</td>
<td>Occurs when a user clicks Update after editing data that was submitted as part of a request.</td>
</tr>
<tr>
<td>Data Edit</td>
<td>Occurs when a user clicks the name of a Data Entry Workflow Step, and then clicks the Edit Data button.</td>
</tr>
<tr>
<td>Data Rejected</td>
<td>Occurs when a Workflow Administrator clicks the Reject Data button to reject the data submitted during a request’s Data Entry Step.</td>
</tr>
<tr>
<td></td>
<td>Each time data is rejected, three activities are recorded:</td>
</tr>
<tr>
<td></td>
<td>• Data Acceptance Cancel</td>
</tr>
<tr>
<td></td>
<td>• Data Rejected</td>
</tr>
<tr>
<td></td>
<td>• Data Submission Begins</td>
</tr>
<tr>
<td>Data Submission Begins</td>
<td>Because the first Workflow Step of the first Workflow Phase of every Request is a Data Entry step, each time a Workflow Consumer or Workflow Administrator submits a new Request, this activity occurs when the Submit button is clicked.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When Workflow Consumers submit a request, they are immediately prompted to enter the required data. However, when Workflow Administrators submit a request, they are not prompted to enter the required data until they click on the first workflow step of the first workflow phase on the Workflow Request page.</td>
</tr>
<tr>
<td>Data Submission Complete</td>
<td>Occurs when a user clicks the Submit button after they have entered all of the initial data that is required for a request (the Data Entry Step of the first Workflow Phase).</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This event occurs simultaneously with the Data Acceptance Begins event.</td>
</tr>
<tr>
<td>SLA Start</td>
<td>Occurs when a user clicks the Start Clock button on the Workflow Request page to restart monitoring of SLA time for the current workflow step.</td>
</tr>
<tr>
<td>SLA Stop</td>
<td>Occurs when a user clicks the Stop Clock button on the Workflow Request page to stop monitoring of SLA time for the current workflow step.</td>
</tr>
<tr>
<td>Workflow Phase Begins</td>
<td>Occurs when the last workflow step in the previous workflow phase is completed.</td>
</tr>
<tr>
<td>Workflow Phase Cancel</td>
<td>Occurs when all workflow steps in a workflow phase are rolled back.</td>
</tr>
<tr>
<td>Workflow Phase Complete</td>
<td>Occurs when the last Workflow Step of a Workflow Phase is completed.</td>
</tr>
<tr>
<td>Workflow Step Begins</td>
<td>Occurs when the previous Workflow Step in a Workflow is completed.</td>
</tr>
</tbody>
</table>
Information that Can Be Included in an Activity Report

Each time an activity occurs, the following information is recorded:

Table 21-20 • Available Activity Report Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Date</td>
<td>Date and time that an activity occurred.</td>
</tr>
<tr>
<td>Activity Name</td>
<td>Name of event that was recorded. See Activities Displayed in the Activity Report for a complete list.</td>
</tr>
<tr>
<td>Activity Owner</td>
<td>User who was “assigned” to the Workflow Step that was active when the activity occurred; the user who performed the activity.</td>
</tr>
<tr>
<td>Workflow Name</td>
<td>Name of the request that the activity was associated with.</td>
</tr>
<tr>
<td>Data Major</td>
<td>Name of the data group that contains a data element that was modified.</td>
</tr>
<tr>
<td>Data Minor</td>
<td>Name of the data element that was modified.</td>
</tr>
</tbody>
</table>
When defining an Activity Report, you choose which of these fields to include in the report. You can also choose to include any data that was entered for a request, and you can also filter the report based upon the value of one of the available report fields.

### How to Create an Activity Report

To create a Custom Activity Report, perform the following steps.

<table>
<thead>
<tr>
<th>Task</th>
<th>To create an Activity Report:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>In the navigation bar, click Create Workflow Request Activity Report. The Select report objects panel of the Create Workflow Request Activity Report page opens.</td>
</tr>
<tr>
<td>2.</td>
<td>Leave Activities selected and click Next. The Select report fields panel opens.</td>
</tr>
<tr>
<td>3.</td>
<td>Select the report fields that you would like to include in the Activity Report and click Next. The Define report filters panel opens, where you can filter the data that you want to appear in the report.</td>
</tr>
</tbody>
</table>

*Note* • For a listing of the report fields available in the Activity Report, see Information that Can Be Included in an Activity Report.

4. Click on a field in the tree and set its filter on the right side using the drop-down boxes and the text box, selecting appropriate logical conditions which are populated according to the selected field. Each time you create a filter, click Add to add the filter to the current filter conditions.

*Note* • Even though you may not have included all of the available report fields in this report, you can still filter the data using all of these report fields.

5. Click Test to test the created query for your report.

6. When you are satisfied with the filter conditions, click Next. The Templates panel opens, listing all available Templates.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Value</td>
<td>Modified value of the edited data element.</td>
</tr>
<tr>
<td>Old Value</td>
<td>Previous value of the edited data element.</td>
</tr>
<tr>
<td>Project Name</td>
<td>Name of project that the request associated with this Activity is associated with.</td>
</tr>
<tr>
<td>Workflow Major</td>
<td>Name of the Workflow Phase that contains the Workflow Step that was current when the activity occurred.</td>
</tr>
<tr>
<td>Workflow Minor</td>
<td>Name of the Workflow Step that was current when the activity occurred.</td>
</tr>
</tbody>
</table>
7. Expand the templates in the tree and select the data that you want to include in the report. All of the data groups and data elements associated with the selected template are listed.

   To display only those templates that are in use in the Available Templates list, select the Templates in use only option.

8. Click Next. The Specify general information panel opens.

9. Enter a Report name and Description to clearly identify the contents and purpose of this report. This name and description will be listed on the All Reports page.

10. Select the Administrator and Consumer roles that you want to have permission to view this report.

11. Click Next. The Save and preview report panel opens, which displays all the information needed to create the report.

12. Click Save and preview. The report is generated. This report is also saved and now appears in the list on the All Reports page.

---

### Generating a Custom SQL Query Report

A Custom SQL Query Report is a report on data generated by Workflow Manager that is defined by entering an SQL query in the Report Wizard. To generate a Custom SQL Query Report, perform the following steps.

**Task**

**To generate a new Custom SQL Query report:**

1. In the navigation bar, click Create Custom SQL Query Report. The Enter SQL Query panel of the Create Custom SQL Query Report page opens.

2. Enter the SQL query which is to retrieve data for your report into the Custom SQL Query text field to retrieve the data for this report. Click the Test button to verify the query syntax.

   **Note** • Refer to Enter SQL Query Panel for information about Workflow Manager database tables which you might want to return data from.

3. Click Next. The Specify general information panel opens.

4. Enter a Report name and Description to clearly identify the contents and purpose of this report. This name and description will be listed on the All Reports page.

5. Decide which roles should have the right to view your report, selecting them from the Roles tree

6. Click Next. The Save and preview report panel opens, summarizing the information that will be used to create your report.

7. Click Save and preview. Your report is generated. The report will now also appear in the list on the All Reports page.
Generating a Custom Stored Procedure Report

You have the option of generating a Workflow Manager report using a stored procedure. A Custom Stored Procedure Report is a report on data generated by Workflow Manager that is defined by specifying a stored procedure.

To generate a Custom Stored Procedure report, perform the following steps.

Task To generate a Custom Stored Procedure report:

1. Open the AMS_CustomReports table and enter the names of the stored procedures you want to use to generate reports.

   Note • For more information on stored procedures, see SQL Stored Procedures in Microsoft TechNet.

   The contents of this panel is determined by the selected stored procedure.

   Note • This panel is customizable per customer need. The filters shown on the screen are based up on the parameters required by the stored procedure.

3. Select a stored procedure from the list and specify any other requested information.

4. Click Next. The Step 2: Specify general information panel opens.
5. In the **Report name** field, enter a name to identify this report. This name will be listed on the **All Reports** page.

6. Enter a **Description** to identify the purpose of this report.

7. In the **Roles** section, select those roles that you want to assign permission to view this report.

8. Click **Next**. The **Step 3: Save and preview report** panel opens.
9. Click **Save and preview**. The report is displayed.

   The report is now saved and available to view by users with appropriate permission.

**See Also**
Generating and Viewing Workflow Manager Reports
Select Stored Procedure Panel

**Wildcard Support in Reports SQL Queries**

*Edition* • *This feature is available in Workflow Manager only.*
In Reports searches, data is always filtered using the SQL LIKE operator. You can combine the LIKE operator with wildcard characters to achieve the following results:

**Table 21-21 • Wildcard Support in Reports Queries**

<table>
<thead>
<tr>
<th>Situation</th>
<th>Rule</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>When no wildcards</td>
<td>If you do not enter a wildcard character in the Search box, then Reports performs a “LIKE” search, meaning that it will identify any occurrence of your search text in the field being searched.</td>
<td></td>
</tr>
<tr>
<td>are used</td>
<td>For example, if you enter the word test in the Search box, Reports would interpret this as <em>test</em> and would return any records containing the word test (including MyTestFile and TestFile).</td>
<td></td>
</tr>
<tr>
<td>When wildcards</td>
<td>You can specify a * wildcard in the Search box to narrow the search results.</td>
<td></td>
</tr>
<tr>
<td>are used</td>
<td>For example, if you want to return all records which contain the word test but do not begin with it, enter *test in the Search box. Then records with the word MyTest would be returned, but not records with the word TestFile.</td>
<td></td>
</tr>
</tbody>
</table>

Generating Standard Reports

**Sample SQL Queries Used to Generate Project and Workflow Request Reports**

AdminStudio 2019 | Reports

| Edition • This feature is available in Workflow Manager only. |

The following queries are used to generate the built-in Project and Workflow Requests reports. These sample queries might be helpful to refer to when you are creating your own custom reports.

**Note • Note that DateTimeHelper.GetUniversalDateTime() is used in some of the queries for demonstration purposes only, it is not valid SQL syntax.**

**Projects Completed On-Time**

The following is a sample query to generate data on projects that were completed on time.

```
SELECT ApplicationID FROM AMS_Application A, AMS_ApplicationStatus AST WHERE A.AppStatusID= AST.StatusID AND AST.IsActive = 1 AND A.StatusSummary =90 AND A.DueDate >= A.ApplicationEndDate AND A.ContractID = 'd135b5ae-8ac0-42b4-a5bc-e105c11b5e13'
```

**Projects Completed Late**

The following is a sample query to generate data on projects that were completed late.
SELECT ApplicationID FROM AMS_Application A, AMS_ApplicationStatus AST WHERE A.AppStatusID = AST.StatusID AND AST.IsActive = 1 AND A.StatusSummary = 90 AND A.DueDate < A.ApplicationEndDate AND A.ContractID = 'd135b5ae-8ac0-42b4-a5bc-e105c11b5e13'

On Time Workflow Requests

The following is a sample query to generate data on workflow requests that were completed on time.

GetOnTimeActiveApplications

SELECT ApplicationID FROM AMS_Application A, AMS_ApplicationStatus AST WHERE A.AppStatusID = AST.StatusID AND AST.IsActive = 1 AND A.StatusSummary <> 90 AND DateTimeHelper.GetUniversalDateTime() < A.RiskDate AND A.ContractID = 'd135b5ae-8ac0-42b4-a5bc-e105c11b5e13'

At Risk Workflow Requests

The following is a sample query to generate data on workflow requests that are at risk of being completed late.

GetAtRiskApplicationCount

SELECT Count(*) FROM AMS_Application WHERE StatusSummary <> 90 AND DateTimeHelper.GetUniversalDateTime() > RiskDate AND DateTimeHelper.GetUniversalDateTime() < DueDate AND ContractID = 'd135b5ae-8ac0-42b4-a5bc-e105c11b5e13'

Exporting Report Data from Reports

AdminStudio 2019 | Reports

You can choose to export data by using the export feature that is built into all lists to export the data in PDF, RTF, XLSX, or CSV format.

Reports Reference

AdminStudio 2019 / AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

This section includes reference information on the following pages, views, and reports:

- All Reports Page
- Search Packages Page
- Application Catalog Reports Page
- Package Report
- Reports Wizard
All Reports Page

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The All Reports page provides access to the following reports:

- **AdminStudio**—Archived Package Reports, Custom SQL Query Report, and Custom Stored Procedure Report.

The All Reports page can be viewed in either a card view or list view.

**Figure 21-21:** System Reports on the All Reports Page (Card View)

You can click on the icon on the top right to toggle this view to list view.
All Reports

Select one of the saved reports below to view.

Standard Reports

Workflow Manager includes the following standard reports:

- Projects Report
- Workflow Requests Summary Report
- Request Detail Report
- Project SLA Report
- Workflow Phases SLA Report
- Workflow Steps SLA Report

Projects Report

*Edition • This page is available in Workflow Manager only.*

Workflow Manager includes the following standard reports:

- Projects Report
- Workflow Requests Summary Report
- Request Detail Report
- Project SLA Report
- Workflow Phases SLA Report
- Workflow Steps SLA Report
A **Projects Report** groups projects by customer and returns summarized information including the progress and Service Level Agreement (SLA) status of workflow requests. You can choose to return information about one project or all of a company’s projects.

To view a Projects Report, click **Projects Report** on the **Reports** menu. The **Projects Report** page opens.

**Table 21-23 • Projects Report Page Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>

</tr>
<tr>
<td>SLA status</td>
<td>To return only workflow requests with specific SLA Status values, choose one or more of: Completed On Time, Completed Late, On Time, At Risk, or Late. Select all of these if you want to report on all workflow requests.</td>
</tr>
<tr>
<td>View Report</td>
<td>Click to generate and display the Projects Report.</td>
</tr>
</tbody>
</table>

**Projects Report Information**

A Projects Report lists project summary information by Workflow Consumer, including request and Service Level Agreement (SLA) status. You can choose to include information on one project or all of a Workflow Consumer’s projects.

The following information is included in the Projects Report:

**Table 21-24 • Projects Report Information**

<table>
<thead>
<tr>

Workflow Requests Summary Report

AdminStudio 2019 | Reports

Edition • This page is available in Workflow Manager only.

A Workflow Requests Summary Report lists request summary information by company, including progress status and Service Level Agreement (SLA) status. You can choose to include information on one request or all of a company’s requests. You can also filter the report by SLA Status.

Table 21-25 • Workflow Requests Summary Report Page Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company</td>
<td>Select the company that you want to view a report on.</td>
</tr>
<tr>
<td>Include</td>
<td>Select one of the following options to specify which requests to include in this report:</td>
</tr>
<tr>
<td></td>
<td>• Single Workflow Request—Select this option to return information about only one workflow request, which you select from the associated combo box.</td>
</tr>
<tr>
<td></td>
<td>• Multiple Workflow Requests—Select this option to return all workflow requests with specific SLA status values. Choose one or more of Completed On Time, Completed Late, On Time, At Risk, or Late to indicate which workflow requests you wish to return. Select all of these options to return all workflow requests associated with a project</td>
</tr>
<tr>
<td>Additional Metadata Filter Conditions</td>
<td>Select this check box to return filter your report by the values provided by people as they complete the data elements in a workflow request.</td>
</tr>
<tr>
<td></td>
<td>If you select this checkbox, the metadata filter fields appear, and you should do the following:</td>
</tr>
<tr>
<td></td>
<td>• Metadata Field—Select the data element that you want to filter by from the list.</td>
</tr>
<tr>
<td></td>
<td>• Conditional Value &amp; Values List—Enter a value for the selected Metadata Field in the Condition Value box or select a value from the Values List (when available).</td>
</tr>
<tr>
<td></td>
<td>• Operator—Select the appropriate Operator from the list (AND or OR).</td>
</tr>
<tr>
<td></td>
<td>You can filter by up to four Metadata Fields.</td>
</tr>
<tr>
<td>View Report</td>
<td>Click to generate and display the Workflow Requests Summary Report.</td>
</tr>
</tbody>
</table>
Workflow Requests Summary Report Information

A **Workflow Requests Summary Report** lists request summary information by company, including progress status and Service Level Agreement (SLA) status. You can choose to include information on one request or all of a company’s requests. You can also filter the report by SLA Status.

The following information is included in a Workflow Requests Summary Report:

**Table 21-26 • Workflow Requests Summary Report Information**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator Company</td>
<td>Identifies the administrator company associated with these workflow requests.</td>
</tr>
<tr>
<td>Selected Workflow Requests</td>
<td>List of the SLA status values included in this report.</td>
</tr>
<tr>
<td>Workflow Requests</td>
<td>List of workflow requests associated with this administrator company. The list includes the following information:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Workflow</strong>—Hyperlinked workflow request name. Click the name to open the <strong>Workflow Request</strong> page for that workflow request.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Start Date</strong>—The date the workflow request was submitted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Due Date</strong>—The date the workflow request is due to be completed, in order to meet SLA requirements.</td>
</tr>
<tr>
<td></td>
<td>• <strong>End Date</strong>—The actual date the workflow request was completed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Progress Status</strong>—The phase type of the workflow request’s current workflow phase.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SLA Status</strong>—The workflow request’s SLA Status. One of On Time, At Risk, Late, Completed Late, or Completed On Time.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Elapsed Time</strong>—The amount of time elapsed since the workflow request was submitted, excluding any periods when the SLA clock was stopped.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SLA Time</strong>—The amount of time elapsed since the workflow request was submitted, excluding any periods when the SLA clock was stopped, and excluding any time spent performing a workflow step that was not tracked.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Company</strong>—The name of the workflow consumer’s company.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Project</strong>—Hyperlinked name of the project associated with this workflow request. Click the name to open the <strong>Projects Report</strong> for that project.</td>
</tr>
</tbody>
</table>

**See Also**

*Generating a Workflow Requests Summary Report*
Request Detail Report

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The Request Detail Report helps you analyze the SLA delivery time for any workflow request. You can use the fields at the top to filter the list of workflow requests displayed in this report, such as to display only workflow requests from a particular project, or just those using a particular workflow template, etc.

You open the Request Detail Report page by clicking Request Detail Report on the Reports menu.

Request Detail Report

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company/Business Unit</td>
<td>Select the name of the company or business unit that you want to view SLA information for.</td>
</tr>
<tr>
<td>Name</td>
<td></td>
</tr>
<tr>
<td>Template</td>
<td>Select the name of the workflow template used by the workflow requests that you want to view SLA information for.</td>
</tr>
<tr>
<td>Project Name</td>
<td></td>
</tr>
<tr>
<td>*Date Range From:</td>
<td></td>
</tr>
<tr>
<td>*Date Range To:</td>
<td></td>
</tr>
</tbody>
</table>

Important • To generate a report that lists SLA data for all workflow requests during a specific date range, do not make a selection from the Template list.
In the Request Detail Report, workflow requests are listed, along with summary SLA information for all phases in that workflow request. Use the plus signs to expand the listing to view the SLA data for workflow phases and steps in a particular workflow request.

You can generate a Project SLA Report to measure and report on the SLA status for a specific project, or for all projects, during a specific date range. This helps you analyze the delivery time for any completed project, and identify bottlenecks and weak points in your process.

Using this report, you can view projects within a specific date range, and then drill down from project level to workflow requests across both phases and steps to see the SLA status at each level.
You open the **Project SLA Report** page by clicking **Project SLA Report** on the **Reports** menu.

### Projects SLA Report

Average SLA Details on phases and steps

![Project SLA Report page](image)

**Figure 21-25: Project SLA Report / Initial View**

The initial view of the Project SLA Report includes the following options:

**Table 21-28 • Project SLA Report Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Template</strong></td>
<td>Select the name of the Workflow Template used by the project or projects that you want to view SLA information for.</td>
</tr>
<tr>
<td><strong>Date Range From</strong></td>
<td><strong>Date Range To</strong></td>
</tr>
<tr>
<td>Report takes into account any completed workflow request.</td>
<td></td>
</tr>
</tbody>
</table>

*Important* • To generate a report that lists SLA data for all projects during a specific date range, do not make a selection from the **Template** list.

<table>
<thead>
<tr>
<th><strong>Date Range From</strong></th>
<th><strong>Date Range To</strong></th>
<th><strong>View Report</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>identify the date range for which you want to view project data.</td>
<td>Click to generate the Project SLA Report using the specified criteria.</td>
<td></td>
</tr>
</tbody>
</table>

In the Project SLA Report data area, click the plus signs to expand the listing to view SLA data across phases and steps for a specific project.
To view SLA information on a specific workflow request, click the hyperlinked Request Name to open the SLA Details by Phase and Workflow Step Subreport for that workflow request.

**Subreport: SLA Details by Phase and Workflow Step**

The SLA Details by Phase and Workflow Step report, which is opened by clicking on a workflow request name in the Project SLA Report, shows delivery time for one completed workflow request across both phases and steps.

To view the SLA data for other workflow steps in that workflow request, use the plus signs to expand the listing.
Notes:
- Workflow Manager stores SLA time in the SLAPeriod field of the ams_applicationItem table. This value is calculated every time the step is completed. Same SLAPeriod field in ams_application table is stored to save SLAPeriod for the whole application. This field is automatically calculated when the application is completed.

Workflow Phases SLA Report

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

A Workflow Phases SLA Report lists all workflow phases for which step-level SLA tracking is being performed along with their SLA Status. SLA (Service Level Agreement) time tracking is used to determine the status of a workflow phase (or workflow request) in relationship to its SLA due date as either: In Progress, On Time, At Risk, Late, Completed on Time, or Completed Late.

Note • For information on enabling workflow-phase level SLA tracking, see “Tracking a Workflow Request or Workflow Phase’s SLA Status” in the Workflow Manager Help Library.

The Workflow Phases SLA Report lists the following details:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only include Workflow Phases in active Workflow Requests</td>
<td>By default, only workflow phases from currently active workflow requests are listed. To display the SLA status of workflow phases from all workflow requests, even those that have been completed, clear the selection of this option and click Refresh Report.</td>
</tr>
<tr>
<td>Project</td>
<td>Project associated with this workflow request.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Workflow request associated with this workflow phase.</td>
</tr>
<tr>
<td>Workflow Phase</td>
<td>Name of workflow phase that is being tracked for SLA status.</td>
</tr>
<tr>
<td>Due Period</td>
<td>The elapsed time (in days) after the workflow phase becomes the current phase that it should be completed in order to be SLA compliant. If it is not completed by this date, its SLA status would be Late and an email alert would be sent out.</td>
</tr>
<tr>
<td>Risk Period</td>
<td>The elapsed time (in days) after which this workflow phase should be considered at risk of not being completed on time (corresponds to SLA status of At Risk).</td>
</tr>
</tbody>
</table>
Workflow Steps SLA Report

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

A Workflow Steps SLA Report lists all workflow steps for which step-level SLA tracking is being performed along with their SLA Status. SLA (Service Level Agreement) time tracking is used to determine the status of a workflow step (or workflow request) in relationship to its SLA due date as either: In Progress, On Time, At Risk, Late, Completed on Time, or Completed Late.

Note • For information on enabling workflow-step level SLA tracking, see “Tracking a Workflow Request or Workflow Step’s SLA Status” in the Workflow Manager Help Library.

The Workflow Steps SLA Report lists the following details:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only include Workflow Steps in active Workflow Requests</td>
<td>By default, only workflow steps from currently active workflow requests are listed. To display the SLA status of workflow steps from all workflow requests, even those that have been completed, clear the selection of this option and click Refresh Report.</td>
</tr>
<tr>
<td>Project</td>
<td>Project associated with this workflow request.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Workflow request associated with this workflow step.</td>
</tr>
</tbody>
</table>

Search Packages Page

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

From the Search Packages page, you can select or search for a specific package, and then generate a detailed Package Report. On this page, you can filter the list of packages displayed in the package tree to display only those packages that meet specific search criteria, which are grouped into three categories:

- Package Attributes—Search by properties assigned to the Windows Installer package. See Package Attributes.
- Package Content—Search by files, registry entries, .ini files, or shortcuts contained in the Windows Installer package. See Package Content.
- Application Request Attributes—Search by information related to a package’s associated request. See Application Request Attributes.

To filter the list of packages displayed in the package tree to display only those packages that meet specific search criteria, enter values in the criteria fields that you want to search on, and click Search. The packages that meet any of the criteria are then listed in the package tree in alphabetical order and are no longer grouped.

Package Attributes

You can search for packages in a catalog based on one or more of any of the following Package attribute metadata:

Table 21-31 • Package Attribute Search Fields

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
</table>
| Package Code  | Enter the GUID that identifies a particular Windows Installer .msi package. The Package Code associates an .msi file with an application or product and is represented as a string GUID—a text string that has a special format:  
{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}  
where each X character is a hex digit (0 through 9 or uppercase A through F). |
Table 21-31 • Package Attribute Search Fields (cont.)

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Code</td>
<td>Enter the GUID that uniquely identifies the particular product release of the package. The ProductCode is a Windows Installer property and is represented as a string GUID—a text string that has a special format: <code>{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX}</code> where each X character is a hex digit (0 through 9 or uppercase A through F).</td>
</tr>
<tr>
<td>Upgrade Code</td>
<td>Enter the GUID that identifies the family of products that are in the same upgrade path. The UpgradeCode is a Windows Installer property and is represented as a string GUID—a text string that has a special format: <code>{XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXXsXXXXX}</code> where each X character is a hex digit (0 through 9 or uppercase A through F).</td>
</tr>
</tbody>
</table>

**Note** • Each stand-alone product usually has its own UpgradeCode GUID. Every version of XYZ Product typically uses the same GUID for the UpgradeCode. In other words, Product A Version 1.0 has the same UpgradeCode as Product A Version 2.0, but has a different UpgradeCode than Product B.

<table>
<thead>
<tr>
<th>Setup File Name</th>
<th>Name of the Windows Installer (.msi) file that was imported into the Application Catalog.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comments</td>
<td>Enter the text of any comments associated with the package.</td>
</tr>
<tr>
<td>Extended Attributes</td>
<td>Enter the value of any of the Extended Attributes associated with the package.</td>
</tr>
</tbody>
</table>

**Package Content**

You can search for packages in a catalog based on one or more of any of the following Package Content metadata

Table 21-32 • Package Content Search Fields

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>Enter the file name of one of the files in the Windows Installer package.</td>
</tr>
<tr>
<td>Registry Key</td>
<td>Enter a registry key to search on.</td>
</tr>
<tr>
<td>Registry Value</td>
<td>Enter a registry value to search on.</td>
</tr>
<tr>
<td>INI File</td>
<td>Enter any changes to an .ini file that are made when the product is installed.</td>
</tr>
<tr>
<td>Shortcut</td>
<td>Enter any shortcuts that are created when the product is installed.</td>
</tr>
</tbody>
</table>
**Application Request Attributes**

You can search for packages in a catalog based on one or more of any of the following attributes of the package’s associated request:

<table>
<thead>
<tr>
<th>Metadata</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the package’s associated request.</td>
</tr>
<tr>
<td>Upload Date</td>
<td>Date the request was submitted.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Enter the date the request is scheduled to be completed, based upon its value for Application Due Period.</td>
</tr>
<tr>
<td>Risk Date</td>
<td>Enter the date at which the request’s status will change to At Risk, which is based upon its value for Application At Risk Period.</td>
</tr>
<tr>
<td>Due Period</td>
<td>Enter, in days, the length of time this request needs to be completed in order to meet its project’s Service Level Agreement (SLA) requirements.</td>
</tr>
<tr>
<td>End Date</td>
<td>Enter the date the request was completed.</td>
</tr>
</tbody>
</table>

Searching for a Package on the Search Packages Page

---

**Application Catalog Reports Page**

**AdminStudio Enterprise Server 2019 | Reports**

*Edition: Reports is included with AdminStudio Enterprise Edition*

On the **Application Catalog Reports** page, you can view a wide array of reports containing summary information on Windows Installer and virtual packages in the AdminStudio Application Catalog. These reports give you insight into the readiness of those packages for distribution and for conversion to virtual packages.

You open the **Application Catalog Reports** page by selecting **Application Catalog Reports** in the **AdminStudio Reports** subgroup of the **Reports** group in the navigation bar.

- Viewing the AdminStudio Application Catalog Reports
- Exporting a Report in PDF, Excel, or Word Format
Viewing the AdminStudio Application Catalog Reports

AdminStudio Enterprise Server 2019 | Reports

On the Application Catalog Dashboard page, you can view a wide array of reports containing summary information on Windows Installer and virtual packages in the AdminStudio Application Catalog. These reports give you insight into the readiness of those packages for distribution and for conversion to virtual packages.

You open the Application Catalog Dashboard page by selecting Application Catalog Dashboard in the AdminStudio Reports subgroup of the Reports group in the navigation bar.

For example, Application readiness Dashboard report is opened and shown in below figure.

![Application Readiness Dashboard Report](image)

**Figure 21-28:** Application Readiness Dashboard Report

You switch between reports by selecting the report name from the Select Report list.

The available reports include test results from operating system compatibility, browser compatibility testing, remote application publishing compatibility, installer best practices testing, and application conflict testing. They also include information about the App-V packages in your Application Catalog, as well as Microsoft System Center Configuration Manager deployment information.
For most reports, detailed sub-reports are available by clicking on one of the categories of the pie bar chart, on one of the numbers in an issue count column, or on a package name. Click on the available hyperlinks until you have explored all of the levels of the report.

For more information, see Viewing Application Testing and Analysis Reports on the Reports Tab in the AdminStudio Help Library.

### Exporting a Report in PDF, Excel, or Word Format

You can save any of the reports on the **Application Catalog Reports** page (and any of the drill-through reports) in PDF, Microsoft Excel, or Microsoft Word format.

<table>
<thead>
<tr>
<th>Task</th>
<th>Saving a report:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>View the report that you want to save.</td>
</tr>
<tr>
<td>2.</td>
<td>In the toolbar, click the <strong>Save</strong> icon.</td>
</tr>
<tr>
<td>3.</td>
<td>From the menu, select either <strong>Excel</strong>, <strong>PDF</strong>, or <strong>Word</strong>. The report is exported and you are prompted for a location to store the report.</td>
</tr>
<tr>
<td>4.</td>
<td>Specify a location and click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>

**Note** • You can also print the currently viewed report by clicking the **Print** icon in the toolbar.

### Package Report

You can generate AdminStudio Package Reports on the **Search Packages** page, which is opened by clicking **Search Packages** under the **AdminStudio Reports** subgroup of the **Reports** group in the navigation bar. On the **Search Packages** page you can perform a search of all of the applications in the Application Catalog to locate the package you would like to generate a report for.

A **Package Report** lists detailed package information for packages of the following deployment types:

- Microsoft Windows Installer packages
- Microsoft App-V virtual packages
Apple iOS mobile apps (local and public store)
Google Android mobile apps (local and public store)

In a Package Report, the information is presented in a tabbed interface, as described in Navigating Through a Package Report. A Package Report includes the following major sections:

- Package Summary Information View
- Files View
- Registry View
- Shortcuts View
- ODBC Drivers View
- ODBC DS View
- Extended Attributes View
- Validation View
- Conflicts View
- History View
- Dependencies View
- Properties View

Note • See also see Information Included in Package Reports.

Note • Additional information may be available for App-V packages.

**Package Summary Information View**

The initial view (Page 1) of a Package Report is the Package Summary Information view, and it lists the following information:

**Table 21-34 • Package Report / Package Summary Information**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Name</td>
<td>Name assigned to the package.</td>
</tr>
<tr>
<td>Manufacturer</td>
<td>Company that authored the package.</td>
</tr>
<tr>
<td>Import Date</td>
<td>The date and time the package was imported into the Application Catalog.</td>
</tr>
<tr>
<td>Unresolved Conflicts</td>
<td>The number of detected conflicts, generated during conflict analysis of this package, which have not yet been resolved—either automatically or manually.</td>
</tr>
<tr>
<td>Product Version</td>
<td>Version of package that is recorded in the package’s Windows Installer file.</td>
</tr>
</tbody>
</table>
The **Files** view lists the all of the files included in the selected package, and the location where these files will be installed. For each file, the following information is listed:

**Table 21-35 • Package Report / Files Information**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File</td>
<td>Name of file included with this package.</td>
</tr>
<tr>
<td>Target Directory</td>
<td>Name of directory where the file is installed.</td>
</tr>
<tr>
<td>Version</td>
<td>Version number of the file.</td>
</tr>
<tr>
<td>File Size</td>
<td>Size of the installed file.</td>
</tr>
<tr>
<td>Component</td>
<td>Component that the file is associated with.</td>
</tr>
</tbody>
</table>

The **Registry** view lists the registry entries that will be created when this package is installed. For each registry entry, the following information is listed:

**Table 21-36 • Package Report / Registry Information**

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root</td>
<td>Identifies the predefined “root” key that contains the registry entry.</td>
</tr>
<tr>
<td>Key</td>
<td>A registry key.</td>
</tr>
<tr>
<td>Name</td>
<td>Name identifying the registry entry.</td>
</tr>
<tr>
<td>Value</td>
<td>The string of data that defines the value of the key.</td>
</tr>
<tr>
<td>Component</td>
<td>Package component that the registry entry is associated with.</td>
</tr>
</tbody>
</table>
Shortcuts View

The **Shortcuts** view lists all of the shortcuts that will be created when this package is installed. For each shortcut, the following information is listed:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name identifying the shortcut.</td>
</tr>
<tr>
<td>Target Directory</td>
<td>Directory and executable that the shortcut invokes.</td>
</tr>
<tr>
<td>Component</td>
<td>Component associated with the shortcut.</td>
</tr>
</tbody>
</table>

ODBC Drivers View

The **ODBC Drivers** view lists all of the Open Database Connectivity (ODBC) drivers in the package.

ODBC Resources are ones that involve interaction with databases. ODBC drivers are libraries that implement functions involving ODBC. Each database type has its own ODBC driver. For each ODBC driver, the following information is listed:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driver</td>
<td>Name of an Open Database Connectivity (ODBC) driver in the package. Each database type has its own ODBC driver.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the ODBC driver identifying its associated database type.</td>
</tr>
<tr>
<td>File</td>
<td>File associated with the ODBC driver.</td>
</tr>
<tr>
<td>Component</td>
<td>Component associated with the ODBC driver.</td>
</tr>
</tbody>
</table>

ODBC DS View

The **ODBC DS** view lists all of the Open Database Connectivity (ODBC) data sources in the package. An ODBC data source identifies the source database type and provides information on how to connect to that database. For each ODBC DS, the following information is listed:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Source</td>
<td>Name of the ODBC data source, which identifies the source database type and provides information on how to connect to that database.</td>
</tr>
<tr>
<td>Description</td>
<td>Identifies the database type.</td>
</tr>
<tr>
<td>Driver Description</td>
<td>Name of this ODBC data source's associated ODBC driver.</td>
</tr>
</tbody>
</table>
Extended Attributes View

The Extended Attributes view lists all of the extended attribute metadata that has been entered for this package. For each Extended Attribute, the following information is listed:

Table 21-40 • Package Report / Extended Attributes Information

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name identifying the attribute.</td>
</tr>
<tr>
<td>Value</td>
<td>Content entered for the attribute.</td>
</tr>
</tbody>
</table>

Validation View

The Validation view lists all of the ICE rule errors and warnings that were generated when the package was validated against Microsoft ICEs (Internal Consistency Evaluators)—custom actions written by Microsoft which can be executed to determine if an installation package is built according to Windows Installer standards.

For each error or warning, the following information is listed:

Table 21-41 • Package Report / Validation Information

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICE Rule</td>
<td>Name of ICE Rule that generated an error or warning message.</td>
</tr>
<tr>
<td>Description</td>
<td>Error or warning message.</td>
</tr>
<tr>
<td>Error Level</td>
<td>Indicates the severity of the message as either being a Warning or an Error.</td>
</tr>
<tr>
<td>• Errors</td>
<td>Package authoring that will cause incorrect behavior.</td>
</tr>
<tr>
<td>• Warnings</td>
<td>Package authoring that could possibly cause incorrect behavior. Warnings can also report unexpected side-effects of package authoring.</td>
</tr>
</tbody>
</table>

Conflicts View

The Conflicts view lists all of the unresolved errors that were found when conflict analysis was performed on this package. For each error, the following information is listed:

Table 21-42 • Package Report / Conflicts Information

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE Rule</td>
<td>Name of ACE Rule that generated the message.</td>
</tr>
</tbody>
</table>
History View

The **History** view lists all of the actions that have been performed on this package since it was imported into the Application Catalog. For each action, the following information is listed:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Day and time the event occurred.</td>
</tr>
<tr>
<td>Action</td>
<td>Identifies the event that occurred.</td>
</tr>
<tr>
<td>User</td>
<td>Identifies the user who executed the event.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the event that occurred.</td>
</tr>
</tbody>
</table>

Dependencies View

The **Dependencies** view lists all of a package’s files that have dependencies with files used by other products or operating systems in the Application Catalog. For each dependency, the following information is listed:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of a file associated with this package that has dependencies with files used by other products or operating systems in the Application Catalog.</td>
</tr>
<tr>
<td>Path</td>
<td>Location where this dependent file is installed.</td>
</tr>
<tr>
<td>Size</td>
<td>Size of the dependent file.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the dependent file.</td>
</tr>
</tbody>
</table>

Properties View

The **Properties** view of the Package Report, which is only displayed for mobile apps, lists various attributes of the selected mobile application.

Reports Wizard

AdminStudio 2019 / AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

Using the Reports Wizard, you can generate Custom and Activity Reports and Custom SQL Query Reports. For more information, see the following topics:

- Creating a Custom Report
- Creating an Activity Report
- Generating a Custom SQL Query Report

You can use the Reports Wizard to generate reports of Workflow Manager deployment at any Workflow Consumer site. You can choose to include or exclude data, regardless of the specific consumer implementation. You can filter the data by companies, projects, requests, workflow Items, and other data, giving you maximum flexibility.

The Reports Wizard is comprised of the following panels:

- Select Report Objects Panel
- Select Report Fields Panel
- Define Report Filters Panel
- Select Template Data Panel
- Enter SQL Query Panel
- Specify General Information Panel
- Save and Preview Report Panel

Note • Only Workflow Administrators with appropriate role permissions can create a report. Workflow Consumers cannot create reports.

Select Stored Procedure Panel

AdminStudio 2019 / AdminStudio Enterprise Server 2019 | Reports

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.
On the **Select Stored Procedure** panel of the Reports Wizard, select the stored procedure that you want to use to generate a report and then click **Get Report**. The contents of this panel is determined by the selected stored procedure. You will be prompted to enter the information required by the stored procedure.

### Create Custom Stored Procedure Report

**Step 1: Select Stored procedure**

![Select Stored Procedure Panel](image)

**Figure 21-29:** Select Stored Procedure Panel

To add a stored procedure to this list, open the AMS_CustomReports table and enter the name of the stored procedure you want to use to generate a report. For more information, see [Generating a Custom Stored Procedure Report](#).

**Note** • For more information on stored procedures, see [SQL Stored Procedures in Microsoft TechNet](#).

### Select Report Objects Panel

**AdminStudio 2019 | Reports**

**Edition** • This panel is available in Workflow Manager only.

On the **Select Report Objects** panel of the Reports Wizard, select the objects you want to include in the report:

- For a **Custom Report**, you can select **Applications**, **Companies**, **Projects**, and **Issues**.
- For an **Activity Report**, the only selection is **Activities**.
Create Custom Workflow Manager Report

Step 1: Select report objects

Figure 21-30: Select Report Objects Panel

Click Next to continue with the Reports Wizard.

Select Report Fields Panel

Edition • This panel is available in Workflow Manager only.

On the Select Report Fields Panel of the Reports Wizard, select the fields you want to include in the report. All of the available fields are listed by object.

- For a Custom Report, the Applications, Companies, Projects, and Issues objects could be listed.
- For an Activity Report, only the Activities object is listed.
Select Report Fields Panel

Click Next to continue with the Reports Wizard.

Define Report Filters Panel

Edition • This panel is available in Workflow Manager only.

On the Define Report Filters panel of the Reports Wizard, enter a filter to define the data that you want to include in this report.
Figure 21-32: Define Report Filters Panel

The Define Report Filters panel includes the following properties:

Table 21-45 • Select Report Filters Panel of the Reports Wizard

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Fields</td>
<td>Select a field from this tree to use to create a filter. When you click on a field to select it, all of its values populate the <em>Select a value for this filter</em> list.</td>
</tr>
</tbody>
</table>
When you have finished defining filters, click Next to continue with the Reports Wizard.

### Table 21-45 • Select Report Filters Panel of the Reports Wizard (cont.)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set Filter Area</td>
<td>Use the following fields to create a filter to apply to this report:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Select a value for this filter</strong>—All of the values of the selected field are listed. Select the one that you want to use to create this filter.</td>
</tr>
<tr>
<td></td>
<td>• <strong>or alternatively type in a value for this filter</strong>—If you want to use a value that does not appear in the list, type the value in this text box.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Operator list box</strong>—Select an operator from this list box to specify how you want the value in the selected field of each record to be selected, such as Equal, Greater Than, Less Than, etc.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Add</strong>—After you have set a filter, click Add to add the filter to the current filter conditions. It will be added to the Test Query box below, and a query is automatically run to determine if this filter generates any records.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Conjunction Express List (AND, OR)</strong>—After you have set one filter, and want to add another, select a conjunction from this box before you click Add to specify whether the record must meet both filter conditions (AND) or only one filter condition (OR).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Test Query</strong>—Click to run the specified query to determine if the filter combination generates any records. If no records are found, you are prompted to change the filters.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reset All</strong>—Click to remove all filter conditions.</td>
</tr>
</tbody>
</table>

When you have finished defining filters, click Next to continue with the Reports Wizard.

### Select Template Data Panel

**AdminStudio 2019 | Reports**

*This panel is available in Workflow Manager only.*

On the Select Template Data panel of the Reports Wizard, you specify the Template data fields that you want to include in this report.
Create Custom Workflow Manager Report

Step 4: Templates

![Templates Panel]

**Figure 21-33:** Templates Panel

In the Available Templates list, click the plus sign next to a Template name to expand the listing to show all data fields associated with that Template, and select the data fields that you would like to include in the report.

Select the Templates in use only option if you want only Templates that are associated with active projects and requests to be listed.

Click Next to continue with the Reports Wizard.

**Enter SQL Query Panel**

Edition • Reports is included with Workflow Manager and AdminStudio Enterprise Edition.

On the Enter SQL Query panel of the Custom SQL Query Reports Wizard, enter an SQL query to retrieve the data for this report.
**Wildcard Support in Reports SQL Queries**

In Reports searches, the `LIKE` operator is always used. You can combine the `LIKE` operator with a wildcard character, and the following rules apply:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Rule</th>
</tr>
</thead>
</table>
| **When no wildcards are used** | If you do not enter a wildcard character in the **Search** box, then Reports performs a “LIKE” search, which searches for any occurrence of that text anywhere in the item that is being searched for.  
For example, if you are searching for a file name that has the word **test** anywhere in the file name, and you entered **test** in the **Search** box, it would be interpreted by Reports as:**test**  
And the following files would be found:  
*MyTestFile* and *TestFile* |
| **When wildcards are used** | You can specify a * wildcard in the **Search** box to narrow the search results.  
For example, if you are searching for a file name that includes the word **test**, but does not begin with it, and you entered **test** in the **Search** box, *MyTestFile* would be returned, but not *TestFile*. |
Specify General Information Panel

Edition • Reports is included with Workflow Manager and AdminStudio Enterprise Edition.

On the Specify General Information panel of the Reports Wizard, enter a Report Name and Description to clearly identify the contents and purpose of this report. This name and description will be listed on the All Reports page.

Figure 21-35: Specify General Information Panel

Next, select the Roles that you want to have permission to view this report.

Click Next to continue with the Reports Wizard.

Note • You can change the selected roles at any time after this report is created by clicking Edit next to the Report Name on the All Reports page.
Save and Preview Report Panel

Edition • Reports is included with AdminStudio Enterprise Edition and with Workflow Manager.

The Save and Preview Report panel lists a summary of the selections you have made while creating the report.

Create Custom SQL Query Report

Step 3: Save and preview report

Figure 21-36: Save and Preview Report Panel
On the **Save and Preview Report** panel of the Reports Wizard, the following information is listed:

**Table 21-47 • Save and Preview Report Panel**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report Name</td>
<td>Name of report.</td>
</tr>
<tr>
<td>Report Fields</td>
<td>List of fields that you selected to be included in this report.</td>
</tr>
<tr>
<td>Template Data</td>
<td>A list of the Template data you selected to be in this report.</td>
</tr>
<tr>
<td>Filters</td>
<td>A list of filters applied to this report.</td>
</tr>
</tbody>
</table>

Click **Save and preview** to generate the Report. The report is generated. This report is also saved and now appears in the list on the **All Reports** page.
About the AdminStudio PowerShell Cmdlets

You can use the AdminStudio PowerShell Cmdlets to integrate your existing .NET applications or scripting environments like Microsoft PowerShell with AdminStudio.

The AdminStudio Platform exposes the core tasks involved in the application readiness process lifecycle. Automating these core tasks via PowerShell scripts or .NET applications helps your enterprise achieve a higher throughput during this process.

This chapter includes the following topics:

- About the AdminStudio PowerShell Cmdlets
- Setting Up AdminStudio Module in PowerShell
- Example Script to Create Application Catalog, Import Packages, and Perform Testing
- PowerShell Cmdlets Reference

About the AdminStudio PowerShell Cmdlets

Some of the core tasks that the AdminStudio PowerShell Cmdlets enables you to automate include:

- **Application Catalogs**—Creating a new Application Catalog or upgrading an existing Application Catalog.
- **Importing**—Importing existing packages into the AdminStudio Application Catalog.
  - Supports importing all the formats that are currently supported by Application Catalog.
• Supports applying transforms and patches to Windows Installer packages during import.
• Supports importing individual packages or a directory of packages.
• Supports importing applications from System Center 2012 Configuration Manager.
• **Application virtualization compatibility**—Checking to see if your packages for suitable for conversion to virtual formats.
• **Application model properties**—Can set the application model properties of an application.
• **Virtualization**—Converting your packages to Microsoft App-V, Citrix XenApp, VMware ThinApp.
  • Allows you to do the conversion one package at a time, or a bulk folder conversion.
• **Testing**—Testing your packages by running operating system compatibility, best practice validation, and conflict analysis tests on the packages, and viewing test results.
• **Publishing**—Publishing your applications to Microsoft System Center 2012 Configuration Manager.

PowerShell support follows the standard Microsoft PowerShell conventions, including well-documented cmdlets within PowerShell.

**Setting Up AdminStudio Module in PowerShell**

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

**Edition** • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

AdminStudio Platform functionality is shipped in the form of a PowerShell Module that can be used in PowerShell. The AdminStudio Module can be installed on a machine or can be used temporarily per PowerShell session.

**AdminStudio Microsoft .NET 4.0 Requirement**

The AdminStudio DLLs are built using .NET 4.0, while PowerShell by default runs in .NET 2.0. To enable PowerShell to load the AdminStudio DLLs, you need to perform the following steps:

**Task** **To enable PowerShell to load AdminStudio DLLs:**

1. Create a file named `PowerShell.exe.config` containing the following content:

   ```xml
   <?xml version="1.0" encoding="utf-8" ?>
   <configuration>
   <startup useLegacyV2RuntimeActivationPolicy="true">
   <supportedRuntime version="v4.0.30319"/>
   <supportedRuntime version="v2.0.50727"/>
   </startup>
   </configuration>
   ```

2. Copy this file to the `C:\Windows\SysWOW64\WindowsPowerShell\v1.0` directory.
Enabling a Module Per PowerShell Session

To enable a Module per PowerShell session, use the following cmdlet:

```
Import-Module-Name [AdminStudioInstallDir]\Common\AdminStudio.Platform.PowerShellExtensions.dll
```

The following import is needed in any of the PowerShell sessions/scripts:

```
Import-Module-Name [AdminStudioInstallDir]\Common\AdminStudio.Utilities.dll
```

Installing the Module on a Machine

To install the AdminStudio Module on a given machine, use the following cmdlet at a PowerShell prompt:

```
Set-Alias installutil $env:windir\Microsoft.NET\Framework\v4.0.30319\installutil
installutil [AdminStudioInstallDir]\Common\AdminStudio.Platform.PowerShellExtensions.dll
```

The following import is needed in any of the PowerShell sessions/scripts:

```
Import-Module-Name [AdminStudioInstallDir]\Common\AdminStudio.Utilities.dll
```

Running the Invoke-ASPublish Cmdlet

To run the Invoke-ASPublish cmdlet, you need the following import, either in your PowerShell script or the current PowerShell session:

```
Import-Module-Name [AdminStudioInstallDir]\Common\AdminStudio.SCCM.Integrator.dll
```

Requirements

The prerequisite includes the following:

- For the AdminStudio Platform to work properly, PowerShell needs to run under administrator privileges and also needs to be launched with the -STA flag.
- AdminStudio’s PowerShell Cmdlets will be available for use only on the machines where AdminStudio is installed and licensed with Enterprise Edition.

Example Script to Create Application Catalog, Import Packages, and Perform Testing

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

CHECK THIS: “AdminStudio\14.0\” IN EXAMPLE BELOW NEEDS TO BE UPDATED EACH RELEASE.

You can use the example PowerShell script that is provided in this section to perform the following tasks:

- **Create Application Catalog**—Create a new Application Catalog database.
- **Import packages**—Import all of the .msi files from a specified directory into the Application Catalog.
- **Perform testing**—Run all selected tests, and report the summary of errors and warnings.
Example Script

The following script uses the Set-ASConfigPlatform, New-ASCatalogPlatform, Invoke-ASImportPackage, and Test-ASPackages AdminStudio PowerShell cmdlets to create a new Application Catalog, import packages, and then test those packages and view the test results. The AdminStudio PowerShell cmdlets and parameters are highlighted:

```powershell
# Read Command Line Parameters
param ($CatalogName = $(Read-Host "Enter New Catalog Name"))

# Input required from users
$folder = "C:\code\Demo"
$ConnectionString = 'PROVIDER=SQLOLEDB.1;Data Source=localhost;Initial Catalog=MyNewCat;Integrated Security=SSPI;'

# Non-User Settings
$shive = "HKLM:\SOFTWARE\Wow6432Node\InstallShield\AdminStudio\15.0\"
$slocation = "Product Location"
$sAsLoc = (Get-ItemProperty $shive $slocation).$slocation
$sCurrentLoc = [Environment]::CurrentDirectory=(Get-Location-PSProvider FileSystem).ProviderPath
$sAsLoc = $sAsLoc + "Common\"
$global:oPkgArray = @()
$global:oPkgArrayFail = @()

# Functions

function Import ($s) {

    $f = [System.IO.File]::GetAttributes($s)
    $d = ($f-band [System.IO.FileAttributes]::Directory)
    if (!$d) {
        Write-Host 'Importing:' $s
        $obj = Invoke-ASImportPackage-PackagePath $s;
        if ($obj.GetType().FullName-eq 'AdminStudio.Platform.Helpers.PackageHelper') {
            #Write-Host 'Success' $s
            $global:oPkgArray = $global:oPkgArray + $obj
        } else {
            Write-Host 'Failed to import:' $s -foregroundcolor red
            $global:oPkgArrayFail = $global:oPkgArrayFail + $obj
        }
    }
}

function LoadDLL ($s) {

}
```
$FileName = $sAsLoc + $s
import-module-name $FileName
}

function PrepAS ()
{
  cd $sAsLoc
  LoadDLL 'AdminStudio.Platform.PowerShellExtensions.dll'
  LoadDLL 'AdminStudio.Utilities.dll'
  LoadDLL 'AdminStudio.SCCM.Model.dll'
  Set-ASConfigPlatform-ConnectionString $ConnectionString
}

function Write-Host-Indent ()
{

Write-Host 'End:' $tEnd-foregroundcolor gray
Write-Host 'Total Time:' $tDiff.Hours' hours' $tDiff.Minutes' minutes ' $tDiff.Seconds 'seconds'
```

**Output**

When you run the script in Example Script, you will see output similar to the following:

```
PS C:\code\Script> .\MyScript.ps1
Enter New Catalog Name: MyScript
Begin: 2/18/2016 11:27:57 AM
**************************************
Import from Folder and Test
**************************************
Directory = C:\code\Demo
ConnectionString = PROVIDER=SQLOLEDB.1;Data Source=localhost;Initial Catalog=MyNewCat;Integrated Security=SSPI;
AdminStudio Directory = C:\Program Files (x86)\AdminStudio\2016\Common\```
Creating New Catalog MyScript

Importing Applications from C:\code\Demo
Importing: C:\code\Demo\Firefox_MSI\Firefox.msi
Packages that Import Succeeded: 1
Packages that Import Failed: 0
End: 2/18/2016 11:28:00 AM
Total Time: 0 hours 0 minutes 3 seconds
Testing Package: Mozilla_Firefox RowId: 2
   Errors: 0
   Warnings: 382
End: 3/18/2016 11:28:35 AM
Total Time: 0 hours 0 minutes 37 seconds

PowerShell Cmdlets Reference

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Following AdminStudio PowerShell Cmdlets are available.

Table 22-1 • AdminStudio PowerShell Cmdlets

Add-ASKeywords

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the `Add-ASKeywords` cmdlet to add App Portal catalog item keywords to the Application Catalog (as individual records in the ASKeywords table). After creating a keyword, you can use the `Set-ASProperty` cmdlet to assign the keyword to an application, as described in the `Set-ASProperty` topic under Keywords.

Note • Keywords created using the `Add-ASKeywords` cmdlet are also available for selection on the Keywords dialog box. For more information, see Specifying Catalog Item Keywords.

Note • Until you create a keyword using either the `Add-ASKeywords` cmdlet or the Edit Keywords dialog box, you cannot use the `Set-ASProperty` cmdlet to assign it to an application. If you attempt to do so, an error will be returned.

Example

The following is an example of the `Add-ASKeywords` cmdlet:

```
Add-ASKeywords -NewKeywords 'accounting, spreadsheet, project management, graphs'
```

Parameters

The `Add-ASKeywords` cmdlet has the following parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| NewKeywords | Use to add App Portal catalog item keywords to the Application Catalog.  
If you are adding more than one keyword, you must enclose the comma-delimited list in single quote marks, such as:  
```
Add-ASKeywords -NewKeywords 'accounting, spreadsheet, graphs'
```

Return Values

One of the following values is returned:

- **True**—Keyword was added to the ASKeywords table.
- **False**—Keyword was not added to the ASKeywords table.
Add-ASPackageForConversion

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

The Add-ASPackageForConversion cmdlet adds a package to the Automated Application Converter project file for conversion. It could be used to add a series of packages to an Automated Application Converter project file for conversion. This cmdlet allows you to make decisions in your script for a list of packages and choose which one you need to add for conversion.

Note • To make sure that the Automated Application Converter project file is cleaned of any packages in it, use the -CleanProjectFile parameter. Usually this is used the first time you add a package.

Examples

The following are examples of the Add-ASPackageForConversion cmdlet:

Add-ASPackageForConversion-PackagePath C:\Packages\Reader\Reader.msi-CleanProjectFile
Add-ASPackageForConversion-PackagePath C:\Packages\Orca\Orca.msi-AACSettings C:\Packages\test.aacx

In this example, two packages are added to the default Automated Application Converter project file (which is specified in the Automated Application Converter settings file using the Set-ASConfigPlatform -AACSettings cmdlet).

This example includes the -CleanProjectFile parameter in the first cmdlet to clean up the list of packages in the project file when it is created. However, it is not necessary to specify the parameter in subsequent Add-ASPackageForConversion cmdlets.

Parameters

The Add-ASPackageForConversion cmdlet has the following parameters:

Table 22-3 • Add-ASPackageForConversion Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackagePath</td>
<td>Mandatory parameter which specifies the path to the package that needs to be added to the Automated Application Converter settings file for conversion.</td>
</tr>
<tr>
<td>[AACSettings]</td>
<td>Use to specify the Automated Application Converter project file to use during conversion. If it is not supplied, a copy of the project file specified in the platform settings file will be used.</td>
</tr>
<tr>
<td>[CleanProjectFile]</td>
<td>Specify this parameter the first time you add a package so that references to any packages in the Automated Application Converter project file will be removed.</td>
</tr>
<tr>
<td>[CommandLine]</td>
<td>Use to specify command line parameters that can be used to silently install this package during repackaging.</td>
</tr>
</tbody>
</table>
Return Values

The name and path to the Automated Application Converter settings file is returned in the following format:

\[Path\]/ProjectFileName.Copy.aacx

Get-ASApplicationID

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

The Get-ASApplicationID cmdlet returns the ApplicationID for a given PackageID. This is useful when you have a PackageID from Invoke-ASImportPackage and need to publish the application to System Center Configuration Manager using the Invoke-ASPublish cmdlet. The Invoke-ASPublish cmdlet requires a mandatory ApplicationID parameter.

Example

The following is an example of the Get-ASApplicationID cmdlet:

Get-ASApplicationID-PackageID 10

Parameters

The Get-ASApplicationID cmdlet has the following parameters:

Table 22-4 • Get-ASApplicationID Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageID</td>
<td>Specify the PackageID of the package that you need the ApplicationID for.</td>
</tr>
</tbody>
</table>
Return Values

The ApplicationID for the package is returned.

Get-ASAppPortalCategories

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

The Get-ASAppPortalCategories cmdlet returns an XML stream of existing categories in App Portal, such as:

```xml
<Categories Status="Synced">
  <Category Id="1" XPath="Software">
    <Name>Software</Name>
  </Category>
  <Category Id="3" XPath="Software/Microsoft">
    <Name>Microsoft</Name>
  </Category>
  <Category Id="2" XPath="Hardware">
    <Name>Hardware</Name>
  </Category>
  <Category Id="13" XPath="Data">
    <Name>Data</Name>
  </Category>
  <Category Id="14" XPath="LM Desktop QA">
    <Name>LM Desktop QA</Name>
  </Category>
</Categories>
```

You can then use the Set-ASProperty cmdlet to set the App Portal category for an application, such as:

```powershell
Set-ASProperty -PackageID 1 -PropertyName "Categories" -PropertyValue "Software/Microsoft"
```

When the application is published to an App Portal-linked distribution system, an App Portal catalog item will be created and will appear in the specified category.

Example

The following is an example of the Get-ASAppPortalCategories cmdlet:

```
Get-ASAppPortalCategories
```

Parameters

The Get-ASAppPortalCategories cmdlet has no parameters.

Note • For more information on setting App Portal properties using PowerShell cmdlets, see App Portal Information Tab under Set-ASProperty. App Portal properties that can be set include: Categories, Template, Keywords, Long Description, and Brief Description.
Get-ASAppPortalTemplates

In App Portal, you can use templates to automatically assign a defined set of properties to a catalog item. The Get-ASAppPortalTemplates cmdlet returns an XML stream of existing templates in App Portal, such as:

```xml
<Templates Status="Synced">
  <Template Id="172">
    <Name>MyTemplateTwo</Name>
  </Template>
</Templates>
```

You can then use the Set-ASProperty cmdlet to set the App Portal template for an application, such as:

```powershell
Set-ASProperty -PackageID 1 -PropertyName "Templates" -PropertyValue "Standard SCCM 2012"
```

When the application is published to an App Portal-linked distribution system, an App Portal catalog item will be created using the specified template.

Example

The following is an example of the Get-ASAppPortalTemplates cmdlet:

```
Get-ASAppPortalTemplates
```

Parameters

The Get-ASAppPortalTemplates cmdlet has no parameters.

Note • For more information on setting App Portal properties using PowerShell cmdlets, see App Portal Information Tab under Set-ASProperty. App Portal properties that can be set include: Categories, Template, Keywords, Long Description, and Brief Description.

Get-ASCatalogItem

The Get-ASCatalogItem cmdlet returns a list of the root items of the specified type: Group, Application, or Package. For example, if you use this cmdlet with the ItemType of Group, the applications in the specified group will be listed, along with each application's RowID. If you use an ItemType of Application, that application's packages will be listed, along with each package's RowID.
You can use this cmdlet to display the groups, applications, and packages in your Application Catalog from a source outside of Application Catalog. Also, once the RowID of an item in the Application Catalog is known, you can use other AdminStudio PowerShell Cmdlets cmdlets to perform actions on that item.

Example

The following is an example of the Get-ASCatalogItem cmdlet:

Get-ASCatalogItem-ItemType 'Group'-ItemId 1

Parameters

The Get-ASCatalogItem cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ItemType</td>
<td>Specify one of the following types to identify which type of catalog item you want to list the contents of, in single quote marks:</td>
</tr>
<tr>
<td></td>
<td>• Group</td>
</tr>
<tr>
<td></td>
<td>• Application</td>
</tr>
<tr>
<td></td>
<td>• Package</td>
</tr>
<tr>
<td>-ItemId</td>
<td>Use to specify the ID number of the group, application or package that you want to list the contents of. For example:</td>
</tr>
</tbody>
</table>

```
Get-ASCatalogItem-ItemType 'Group'-ItemId 10
```

Sample Script

Below is a sample script that uses the Get-ASCatalogItem cmdlet. If you use option 11 in this script, the entire package tree will be returned.

```

Notes
In this script, make sure that you define the following parameters correctly:

$global:CatalogName = 'MyNewCatalog'
$ConnectionString = 'PROVIDER=SQLOLEDB.1;Data Source=localhost;Initial Catalog=' + $global:CatalogName + ';Integrated Security=SSPI;'

Return Values
A list of the root items of the specified type is returned: Group, Application, or Package.
Get-ASConfigPlatform

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the Get-ASConfigPlatform cmdlet to retrieve configuration information, such as to retrieve the database connection string to which the current PowerShell session is configured.

Example

Get-ASConfigPlatform -ConnectionString

For example, if the Get-ASConfigPlatform cmdlet is used with the -ConnectionString parameter, the database connection string to which the current PowerShell session was configured using Set-ASConfigPlatform cmdlet will be returned, such as:

```
PROVIDER=SQLOLEDB.1;Data Source=ADMIN-PC;Initial catalog=TesCatalog;Integrated Security=SSPI
```

Parameters

The Get-ASConfigPlatform cmdlet has the following parameters:

Table 22-6 • Get-ASConfigPlatform Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ConnectionString]</td>
<td>Use to specify the connection string for Application Catalog.</td>
</tr>
<tr>
<td>[Group]</td>
<td>Use to specify the group to import packages into. The group should already exist in the Application Catalog.</td>
</tr>
<tr>
<td>[AACSettingsFile]</td>
<td>Specify the Automated Application Converter project file (.aacx) to use for all conversion tasks. This setting can be overridden by individual conversion cmdlets.</td>
</tr>
<tr>
<td>[OutputPath]</td>
<td>Specify the default output folder under which all virtualized packages will be stored. This setting can be overridden by individual conversion cmdlets.</td>
</tr>
<tr>
<td>[HardTimeout]</td>
<td>Hard time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[SoftTimeout]</td>
<td>Soft time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[BuildAppV]</td>
<td>Build Microsoft App-V packages (*.sft). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildXenApp]</td>
<td>Build Citrix XenApp profiles (*.profile). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildThinApp]</td>
<td>Build VMWare ThinApp packages (*.exe). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildMSI]</td>
<td>Build Windows Installer packages (*.msi). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[AppVServerHost]</td>
<td>Host name portion of the server location for App-V packages.</td>
</tr>
</tbody>
</table>
Return Values

The connection string to which the current PowerShell session is configured is returned.

Get-ASApplicationDeploymentSummary

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the Get-ASApplicationDeploymentSummary cmdlet to obtain the deployment history of a given distribution system.

Example

Get-ASApplicationDeploymentSummary -ConnectionName MySCCM2012Connection

Parameters

The Get-ASApplicationDeploymentSummary cmdlet has the following parameters:

Table 22-7 • Get-ASApplicationDeploymentSummary Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionName</td>
<td>Name of the distribution system connection for which to obtain deployment summary data. This is the same data that is displayed on the Server Options &gt; Distribution System tab of the Application Catalog Options dialog box.</td>
</tr>
</tbody>
</table>

Note • For information on creating a named connection to a deployment system, see Creating Multiple Named Connections to Distribution Systems.

Return Values

This cmdlet returns an ApplicationDeploymentInfo object, such as the following:

```csharp
public class ApplicationDeploymentInfo
{
    public int groupId { get; private set; }
    public string appId { get; private set; }
    public string scopeId { get; private set; }
    public string customId { get; private set; }
}
```
Get-ASDeploymentSystemPackageTree

**Parameters**

The `Get-ASDeploymentSystemPackageTree` cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SystemConnectionName</td>
<td>Use to specify a named connection to a deployment system. See Creating Multiple Named Connections to Distribution Systems for more information.</td>
</tr>
</tbody>
</table>
Note • To import an application using the Application ID identified using the Get-ASDeploymentSystemPackageTree cmdlet, see Invoke-ASImportAppFromDeploymentSystem.

Return Values
XML output containing a list of all of a deployment system’s applications and groups is returned.

Get-ASDistributionProperty

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Get-ASDistributionProperty cmdlet to retrieve the property value of the distribution system for a package. The property name will be fetched from the Property_PluginId table for the corresponding distribution system. For example, for Casper server distribution system, the property will be fetched from [Property_D66C6D178D0549419D129CED618A6C9E].

Example
The following is an example of the Get-ASDistributionProperty cmdlet:

Get-ASDistributionProperty -PackageId 9 -SystemConnectionName 'Altiris' -PropertyName 'PackageName'

Important • All parameters are mandatory.

Parameters
The Get-ASDistributionProperty cmdlet has the following parameters:

Table 22-9 • Get-ASDistributionProperty Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>(Required) Use to specify the ID number of the package that you want to get distribution properties for. The ID number is obtained from the cstblPackage table.</td>
</tr>
<tr>
<td>-SystemConnectionName</td>
<td>(Required) Use to specify a named connection to a deployment system. See Creating Multiple Named Connections to Distribution Systems for more information.</td>
</tr>
<tr>
<td>PropertyName</td>
<td>(Required) Use to specify the name of the property that you want to get. The name of the property is fetched from the Property_PluginId table for the corresponding distribution system.</td>
</tr>
</tbody>
</table>
Returns

The corresponding property value’s display text is returned.

Note • The value of a property that is stored may not be the value which is displayed in the AdminStudio user interface. For example, Workspace ONE has a property called pushmodeinternal (enum) and one of its values is ondemand. However, in the AdminStudio user interface, this value is displayed as On Demand. The Get-ASDistributionProperty cmdlet returns the display value (On Demand), not the stored value (ondemand).

Get-ASPProperty
Set-ASPProperty
Set-ASDistributionProperty

Get-ASKeywords

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Get-ASKeywords cmdlet to return a comma-delimited list of App Portal catalog item keywords in the Application Catalog’s ASKeywords table.

Example

The following is an example of the Add-ASKeywords cmdlet:

Get-ASKeywords

After creating the keywords, you can use the Set-ASPProperty cmdlet to assign keywords to an application, as described in the Set-ASPProperty topic under Keywords.

Note • Keywords are created using either the Add-ASKeywords cmdlet or on the Edit Keywords dialog box, as described in Specifying Catalog Item Keywords. Keywords are assigned to an application using the Set-ASPProperty cmdlet or using the Keywords dialog box.

Return Values

Returns a comma-delimited list of App Portal catalog item keywords in the Application Catalog’s ASKeywords table.

Get-ASPackages

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.
Use the `Get-ASPackage` cmdlet to return a package object, given the `PackageId`. The default connection string set in the platform settings file is used to query the Application Catalog. If a package with the specified ID is found, it is returned.

**Examples**

```powershell
Get-ASPackage -PackageId 10
'Package Path is: " + $oPackage.FileName
```

**Parameters**

The `Get-ASPackage` cmdlet has the following parameters:

**Table 22-10 • Get-ASPackage Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>ID of the package that will be returned.</td>
</tr>
</tbody>
</table>

**Return Values**

If a package with the specified ID is found, its package object is returned.

---

**Get-ASPackageTestSummary**

**Edition** • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

You can use the `Get-ASPackageTestSummary` cmdlet to return a summary of various tests performed for the package that is specified using the `-PackageId` parameter.

**Examples**

```powershell
Get-ASPackageTestSummary -PackageId 35
```

**Parameters**

The `Get-ASPackageTestSummary` cmdlet has the following parameters:

**Table 22-11 • Get-ASPackageTestSummary Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>ID of the package that will be returned.</td>
</tr>
</tbody>
</table>

**Sample**

Below is sample code using the `Get-ASPackageTestSummary` cmdlet.

```powershell
function ASPackageTestSummary ()
{
```
[String] $Item = Read-Host "Enter Package to see summary of"
if ($Item)
{
    Write-Host 'Return Value: '
    $oTestResults = Get-ASPackageTestSummary $Item
    foreach ($oTestResult in $oTestResults)
    {
        Write-Host ($oTestResult.CategroyName)-foregroundcolor yellow
        Write-Host '     Errors:' ($oTestResult.TotalErrors)-foregroundcolor white
        Write-Host '     Warnings: ' ($oTestResult.TotalWarnings)-foregroundcolor white
        Write-Host '     Overall Assessment: ' ($oTestResult.OverallAssessment)-foregroundcolor white
    }
}

Return Values
A summary of the tests that were performed for the specified package is returned.

Get-ASProperty
AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Get-ASProperty cmdlet to return the value for a property specified using the -PropertyName parameter associated to a specified package specified using -PackageId parameter.

Note • The Get-ASProperty cmdlet supports only System Center Configuration Manager distribution-level properties. To get other distribution-level properties for a package, use Get-ASDistributionProperty.

Note • The Get-ASProperty cmdlet also supports ASCMPackageData table properties. This is a dynamic table that stores some of the properties of the new package types such as .apk, .ipa, .dmg, etc. These property values can be fetched using this cmdlet.

Example

Get-ASProperty-PackageName 35-PropertyName "AutoInstall"

Parameters
The Get-ASProperty cmdlet has the following parameters:

Table 22-12 • Get-ASProperty Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>ID of the package that will be returned.</td>
</tr>
</tbody>
</table>
**Get-ASTestDetails**

You can use the `Get-ASTestDetails` cmdlet of the AdminStudio PowerShell Cmdlets to display the details of an application compatibility or Microsoft ICE test that is run using the `Test-ASPackage` cmdlet. For example:

```powershell
Get-ASTestDetails -TestId $nnnn
```

**Parameters**

The `Get-ASTestDetails` cmdlet has the following parameters:

**Table 22-13 • Get-ASTestDetails Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TestId $nnnn</td>
<td>Use to specify the ID of the application compatibility or Microsoft ICE test that you want to see a description of, where $nnnn is the test ID. The test ID number can be found in the results that are generated by the <code>Test-ASPackage</code> cmdlet when the <code>-DetailedResults</code> parameter is used.</td>
</tr>
</tbody>
</table>

**Return Values**

The details of an application compatibility or Microsoft ICE test that was run using the `Test-ASPackage` cmdlet are returned.
Get-ASTestState

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Get-ASTestState cmdlet to return the test state (selected or not selected) of a given test.

Example

The following is the syntax used to return the test state of a given test:

Get-ASTestState-TestId nnnnn

For example:

Get-ASTestState-TestId ICE33

Parameters

The ASTestState cmdlet has the following parameters:

Table 22-14 • ASTestState Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TestId</td>
<td>Use to specify the ID number of the test that you are checking the test state of. This is the same ID number that identifies the test on the Application Catalog Select Tests to Execute dialog box.</td>
</tr>
</tbody>
</table>

Return Values

One of the following values is returned:

- **True**—Test is selected to run.
- **False**—Test is not selected to run.

Get-ASVirtualReadiness

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the Get-ASVirtualReadiness cmdlet to obtain the virtualization readiness status of a given package.

Example

Get-ASVirtualReadiness-PackagePath "\\111.22.33.44\Packages\win32-setup.msi"-PackageId 425
Parameters

The Get-ASVirtualReadiness cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackagePath</td>
<td>Mandatory parameter which specifies the path to the package that you want to obtain the virtualization readiness status of.</td>
</tr>
<tr>
<td>[PackageId]</td>
<td>Specify the package ID of package that you are testing so that the virtualization readiness status returned by the Get-ASVirtualReadiness cmdlet will be stored in the Application Catalog.</td>
</tr>
</tbody>
</table>

Return Values

If an error or warning is generated, one of the following values is returned:

<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32</td>
<td>✘</td>
<td>Click Once</td>
<td>Package contains a ClickOnce application. ClickOnce is a per-user installation format that is often incompatible with the per-machine nature of virtual package deployment. A ClickOnce application also may try to automatically update itself, which results in invalid versioning in the application virtualization client.</td>
</tr>
<tr>
<td>64</td>
<td>🚸</td>
<td>Shell Extension</td>
<td>Package contains a shell extension. Shell extensions extend Windows Explorer and cannot be loaded from a virtual package. This extension may be critical to the use of this application, and, if so, this application will not function when virtualized. However if this extension is non-critical, the application may function when virtualized.</td>
</tr>
<tr>
<td>128</td>
<td>✘</td>
<td>OS Integrated</td>
<td>Package contains files that are closely integrated with the operating system. The files that make up applications like Internet Explorer or Windows Media Player, or frameworks like the .NET Framework, do not make good candidates for virtualization. These files should instead be installed locally on the machine.</td>
</tr>
<tr>
<td>256</td>
<td>✘</td>
<td>Boot Service</td>
<td>Package contains a service that starts at boot-time. Virtualized services are limited to the lifetime of the virtual application, so services that must start at boot-time do not make good candidates for virtualization to App-V or XenApp formats. It may be possible to extract this service such that it can be installed locally on the machine and allow the rest of the package to be virtualized.</td>
</tr>
</tbody>
</table>
### Table 22-16 • Error and Warning Return Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>512</td>
<td></td>
<td>Too Large</td>
<td>Package contains more than 4 GB of files. Since App-V 4.x and XenApp do not support packages that contain more than 4 GB of files, this application cannot be successfully virtualized to App-V 4.x or XenApp as an uncompressed package. However, if the compressed size of the package is less than 4 GB, then this application can be virtualized to these formats as a compressed package.</td>
</tr>
<tr>
<td>1024</td>
<td></td>
<td>COM Surrogate DLLs</td>
<td>Package contains a COM DLL that uses surrogate virtualization. App-V, XenApp, and ThinApp do not support COM DLL surrogate virtualization, so this package may not work correctly if virtualized.</td>
</tr>
<tr>
<td>4096</td>
<td></td>
<td>Device Drive</td>
<td>Package contains a device driver. System-level drivers such as print drivers or USB device drivers do not work from a virtualized environment. It may be possible to extract this driver such that it can be installed locally on the machine and allow the rest of the package to be virtualized.</td>
</tr>
<tr>
<td>8192</td>
<td></td>
<td>Questionable</td>
<td>Package is questionable for conversion.</td>
</tr>
<tr>
<td>16384</td>
<td></td>
<td>Unsuitable</td>
<td>Package is unsuitable for conversion.</td>
</tr>
<tr>
<td>32768</td>
<td></td>
<td>64-Bit Package</td>
<td>Package is a 64-bit package. XenApp and ThinApp do not support virtualization of 64-bit packages.</td>
</tr>
<tr>
<td>65536</td>
<td></td>
<td>ASP.NET/IIS Application</td>
<td>Package contains an ASP.NET or IIS application component, which is not supported by App-V 4.x, App-V 5.x, XenApp, and ThinApp. If the ASP.NET or IIS application component is not an important part of the application, or if it can be separately installed from the package, this error can be suppressed and ignored.</td>
</tr>
<tr>
<td>131072</td>
<td></td>
<td>WMI Provider</td>
<td>Package contains a WMI provider component, which is not supported by App-V 4.x, App-V 5.x, XenApp, and ThinApp. If the WMI Provider component is not an important part of the application, or if it can be separately installed from the App-V package, this error can be suppressed and ignored.</td>
</tr>
<tr>
<td>262144</td>
<td></td>
<td>J2EE Application Server</td>
<td>Package contains a J2EE application server, which is not supported by App-V, XenApp, or ThinApp. If the J2EE application is not an important part of the application, or if it can be separately installed from the package, this error can be suppressed and ignored.</td>
</tr>
</tbody>
</table>
Invoke-ASAppVBulkUpgrade

The Invoke-ASAppVBulkUpgrade cmdlet is used for bulk conversion of App-V 4.x packages (.sft) to App-V 5.x packages (.appv).

Example

The following is an example of the Get-ASAppVBulkUpgrade cmdlet:

Invoke-ASAppVBulkUpgrade-GroupID 11-UpgradeComments "Bulk Upgrade"

Parameters

The Invoke-ASAppVBulkUpgrade cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupID</td>
<td>Specifies the group ID of the group containing legacy App-V packages in the catalog.</td>
</tr>
<tr>
<td>UpgradeComments</td>
<td>Specifies the comments to document the upgraded package.</td>
</tr>
</tbody>
</table>

Return Values

A success or failure message is returned along with the details of the failure.
Invoke-ASConvertFolder

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the Invoke-ASConvertFolder cmdlet to convert a folder of packages to specified virtual formats using Automatic Application Converter. The conversion settings specified in the platform settings file are applied across all packages found in the specified folder.

Tip • If you need to apply settings on per package basis, it is recommended that you use the Add-ASPackageForConversion cmdlet.

Examples

Invoke-ASConvertFolder -FolderPath C:\Packages-BuildAppV -OutputPath C:\VirtualizedPackages

Parameters

The Invoke-ASConvertFolder cmdlet has the following parameters:

Table 22-18 • Invoke-ASConvertFolder Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FolderPath</td>
<td>Use to specify the path to the folder where the packages to be converted are stored.</td>
</tr>
<tr>
<td>[ AACSettings ]</td>
<td>Use to specify the Automated Application Converter project file to use during conversion. If it is not supplied, a copy of the project file specified in the platform settings file will be used.</td>
</tr>
<tr>
<td>[ OutputPath ]</td>
<td>Use to specify the output folder under which all output will be collected.</td>
</tr>
<tr>
<td>[ BuildAppV ]</td>
<td>Specify this parameter to build App-V packages.</td>
</tr>
<tr>
<td>[ BuildXenApp ]</td>
<td>Specify this parameter to build Citrix XenApp profiles.</td>
</tr>
<tr>
<td>[ BuildThinApp ]</td>
<td>Specify this parameter to build VMware ThinApp packages.</td>
</tr>
<tr>
<td>[ BuildMSI ]</td>
<td>Specify this parameter to build Windows Installer packages.</td>
</tr>
<tr>
<td>[ HardTimeout ]</td>
<td>Hard time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[ SoftTimeout ]</td>
<td>Soft time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[ UseSingleStepSnapshot ]</td>
<td>Use to specify that you want to use the Snapshot installation technology to repack the package.</td>
</tr>
</tbody>
</table>
Chapter 22  
AdminStudio PowerShell Cmdlets

Return Values
A success or failure message is returned.

Invoke-ASConvertPackageEx

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

The Invoke-ASConvertPackageEx cmdlet invokes the Application Catalog Conversion Wizard process to convert a package from one package type to another. You can use the Invoke-ASConvertPackageEx cmdlet to:

- Convert an App-V 4.x package to App-V 5.0 format.
- Convert one or multiple Windows Installer packages or legacy installers to virtual packages using default Automated Application Converter settings.

You are required to specify a target type and an Automated Application Converter settings file.

Example

Invoke-ASConvertPackageEx-PackageID $n-TargetType type-AACSettings $PathToSettingsFile

For example:

Invoke-ASConvertPackageEx-PackageID 5-TargetType AppVS -AACSettings C:\MyProjectFile\MySettings.aacx

Parameters

The Invoke-ASConvertPackageEx cmdlet has the following parameters:

**Table 22-19 • Invoke-ASConvertPackageEx Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>The ID of the source package to be converted.</td>
</tr>
</tbody>
</table>
Invoke-ASImportAppFromDeploymentSystem

Return Values
Success or failure messages are returned.

## Table 22-19 • Invoke-ASConvertPackageEx Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TargetType</td>
<td>Follow the -TargetType parameter with one of the following to identify the deployment type of the converted package:</td>
</tr>
<tr>
<td></td>
<td>• AppV4</td>
</tr>
<tr>
<td></td>
<td>• AppV5</td>
</tr>
<tr>
<td></td>
<td>• Profile</td>
</tr>
<tr>
<td></td>
<td>• ThinApp</td>
</tr>
<tr>
<td></td>
<td>• Msi</td>
</tr>
<tr>
<td></td>
<td>• Symantec</td>
</tr>
<tr>
<td></td>
<td>• MSIX</td>
</tr>
<tr>
<td>AACSettings</td>
<td>Enter the fully qualified path to the .accx project file that will be used for the conversion, which contains virtual machine login information and conversion defaults.</td>
</tr>
<tr>
<td></td>
<td>Note • For more information, see Creating an Automated Application Converter Settings File.</td>
</tr>
<tr>
<td>CommandLine</td>
<td>This parameter is used to pass command line switches to the installer during an unattended installation, such as when Automated Application Converter automatically launches a virtual machine to perform repackaging.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set, it takes precedence. If this parameter is not set, then any specified command line in the Automated Application Converter plugin options takes precedence. If neither are specified, then Automatic Application Converter automatically uses a basic UI mode for MSI packages.</td>
</tr>
</tbody>
</table>

## Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the Invoke-ASImportAppFromDeploymentSystem cmdlet to import an application from a deployment system, such as System Center 2012 Configuration Manager, into the Application Catalog using the application ID returned from the Get-ASDeploymentSystemPackageTree cmdlet.
Example

The following is an example of the `Invoke-ASImportAppFromDeploymentSystem` cmdlet and its parameters:

```
Invoke-ASImportAppFromDeploymentSystem-ConnectionName <Name>-SystemDeploymentID <ID> -TargetASGroupPath "<Path excluding the root folder ('Applications')>
```

The following is an example of the `Invoke-ASImportAppFromDeploymentSystem` cmdlet using sample values:

```
Invoke-ASImportAppFromDeploymentSystem-ConnectionName SCCM2012-SystemDeploymentID 16778779 -TargetASGroupPath "Test\SubTest"
```

Parameters

The `Invoke-ASImportAppFromDeploymentSystem` cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionName</td>
<td>Use to specify named connection to a deployment system. See <a href="#">Creating Multiple Named Connections to Distribution Systems</a> for more information.</td>
</tr>
<tr>
<td>SystemDeploymentID</td>
<td>The ID of the application you are importing from your deployment system such as: SystemDeploymentID 16778779. You obtain this ID by first running the <code>Get-ASDeploymentSystemPackageTree</code> cmdlet.</td>
</tr>
<tr>
<td>TargetASGroupPath</td>
<td>Use to specify the destination group in the Application Catalog tree for the imported application. Note: When specifying this path, exclude the root folder (<code>Applications</code>).</td>
</tr>
</tbody>
</table>

Return Values

A success or failure message is returned.

**Invoke-ASImportPackage**

Edition • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

The `Invoke-ASImportPackage` cmdlet invokes the import process on a single package.

Examples

In this example, the `Orca.msi` package from the given path is imported, as well as the specified transform file.
Invoke-ASImportPackage -PackagePath C:\Packages\Orca\Orca.msi -Transforms C:\Packages\Orca\Orca.mst

You can also import .exe files into the Application Catalog using the Invoke-ASImportPackage cmdlet:

Invoke-ASImportPackage -PackagePath C:\Packages\ABCapp\ABC.exe

**Parameters**

The Invoke-ASImportPackage cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackagePath</td>
<td>Specify the path to the package to be imported.</td>
</tr>
<tr>
<td>[Group]</td>
<td>Use to specify the group into which the package will be imported.</td>
</tr>
<tr>
<td></td>
<td>When specifying the Group parameter, you need to include the Applications root group in the path to the group. For example:</td>
</tr>
<tr>
<td></td>
<td>Invoke-ASImportPackage -PackagePath C:\Packages\Orca\Orca.msi -Group &quot;Applications\SubGroup\SubGroup1&quot;</td>
</tr>
<tr>
<td></td>
<td>If you do not include the Applications root group in the path, the packages will be imported under the root node instead of the specified folder path.</td>
</tr>
<tr>
<td>[Transforms]</td>
<td>List of transforms to apply during the import process. Specify the full paths. When specifying multiple transform files, use commas to separate them.</td>
</tr>
<tr>
<td>[Patches]</td>
<td>List of patches to apply during the import process. Specify the full paths. When specifying multiple patches, use commas to separate them.</td>
</tr>
<tr>
<td>[InstallCommandLine]</td>
<td>Use to set the package's <strong>Install command line</strong> property. This property will be transferred to System Center Configuration Manager when the package's application is published.</td>
</tr>
<tr>
<td></td>
<td>Invoke-ASImportPackage -PackagePath &quot;C:\Packages\Calc2020\Calc2020.msi&quot; -InstallCommandLine &quot;msiexec /i 'Calc2020.msi'&quot;</td>
</tr>
<tr>
<td>[ExistingPackageId]</td>
<td>In the case of reimporting an existing package, use this parameter to specify the existing package's ID.</td>
</tr>
</tbody>
</table>

**Return Values**

A success or failure message is returned.

---

Invoke-ASWrapPackage

*Edition* • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.
Use the `Invoke-ASWrapPackage` to convert a Windows Installer (.msi) or installation package (.exe) to a wrapped package file (.ps1/.exe).

**Example**

```powershell
Invoke-ASWrapPackage -PackageId 25 -OutputLocation "C:\Users\ssahoo\Desktop" -WrapType Exe
```

**Parameters**

The `Invoke-ASWrapPackage` has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageID</td>
<td>(Required) Enter the package ID to identify the package you want to wrap.</td>
</tr>
<tr>
<td>OutputLocation</td>
<td>(Optional) If you want to change the default packaging location, specified on the Wrap Options tab of the Application Catalog Options dialog box, use this parameter.</td>
</tr>
<tr>
<td>WrapType</td>
<td>Either add .ps1 or .exe</td>
</tr>
</tbody>
</table>

**Return Values**

A success or failure message is returned.

---

**Invoke-ASPublish**

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

**Edition** - Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use the `Invoke-ASPublish` cmdlet to publish a package to a deployment server, such as System Center 2012 Configuration Manager, Citrix XenApp Server, Symantec Altiris Server, or Workspace ONE Server. For publishing, an ApplicationID is needed instead of a PackageID.

**Tip** - If you have the PackageID, you can determine the ApplicationID by using the `Get-ASApplicationID` cmdlet.

**Specifying an Import-Module Cmdlet**

Because publishing requires `AdminStudio.SCCM.Integrator.dll`, you need to specify an Import-Module cmdlet either in your PowerShell session or in the PowerShell script.

You can import this module for your PowerShell session as shown below:

```powershell
Import-Module-Name [AdminStudioInstallDirectory]\Common\AdminStudio.SCCM.Integrator.dll
```

You can either specify this import in your PowerShell script or in a PowerShell session at the command prompt.
Examples

First, use a package's PackageID to obtain its ApplicationID:

$AppID = Get-ASApplicationID-PackageID 10

Then, use the ApplicationID to publish the package:

Invoke-ASPublish-ConnectionName "SCCM12"-ApplicationID 35-TargetGroup "Applications\Marketing"-Password "ABC1234"

Parameters

The Invoke-ASPublish cmdlet has the following parameters:

Table 22-23 • Invoke-ASPublish Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionName</td>
<td>Use to specify named connection to a deployment system. See Creating Multiple Named Connections to Distribution Systems for more information.</td>
</tr>
<tr>
<td>ApplicationID</td>
<td>Specify the ApplicationID of the application you are publishing.</td>
</tr>
<tr>
<td>[TargetGroup]</td>
<td>Specify the target group on the deployment server that you want to publish this application to.</td>
</tr>
<tr>
<td>[Password]</td>
<td>Specify the password of the deployment server you are publishing to.</td>
</tr>
</tbody>
</table>

Note • If you publish an application with an empty Target Group to Workspace ONE server, the application will be published to the default organization group to which the particular Workspace ONE user belongs to.

Return Values

A success or failure message is returned.

Invoke-ASUpdatePackage

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.
Starting with AdminStudio 2016, when you import suite executables (.exe) that contain child packages, the child packages are automatically extracted during import and are available for testing.

However, if you are upgrading an existing Application Catalog (from releases prior to AdminStudio 2016) that already contains installers with bundled child packages, you will need to run the Invoke-ASUpdatePackage cmdlet on each of those existing installers to extract details on the child packages bundled with those installers.

The Invoke-ASUpdatePackage cmdlet is run on an existing .exe package to extract the bundled .msi details. Along with child package extraction, the Invoke-ASUpdatePackage also extracts Java dependency information and identifies the type of suite .exe.

**Example**

The following is an example of the Invoke-ASUpdatePackage cmdlet:

```
Invoke-ASUpdatePackage -PackageId 2
```

**Parameters**

The Invoke-ASUpdatePackage cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>ID of the package from cstblPackage table.</td>
</tr>
</tbody>
</table>

**Procedure**

To use the Invoke-ASUpdatePackage cmdlet to extract bundled .msi details from an .exe package, perform the following steps.

1. Select an .exe package from cstblpackage table.
2. Open a PowerShell cmdlet and set a connection to an existing Application Catalog database.
3. Import the necessary PowerShell assemblies.
4. Enter the following:
   ```
   Invoke-ASUpdatePackage -PackageId 2
   ```

   Information about the bundled .msi packages is extracted. The extracted .msi packages will be listed in the AdminStudio user interface.
Invoke-ASSignPackage

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

*Edition •* Powershell cmdlets are enabled with AdminStudio Enterprise Edition.

Use the Invoke-ASSignPackage cmdlets to sign the MSIX package.

**Example**

The following is an example of the Invoke-ASSignPackage cmdlet:

```powershell
Invoke-ASSignPackage -PackageId 1 -CertificateInfoType PfxFile -FilePath "E:\Packages\MSIX\Orca\FlexeraDigCert.pfx" -Password "121"
```

**Parameters**

The Invoke-ASSignPackage has the following parameters:

**Table 22-25 •** Invoke-ASSignPackage Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PackageID</strong></td>
<td>(Required) Enter the package ID to identify the package you want to Sign.</td>
</tr>
<tr>
<td><strong>CertificateInfoType</strong></td>
<td>Follow the -CertificateInfoType parameter with one of the following to identify the Signing type of the MSIX package:</td>
</tr>
<tr>
<td></td>
<td>• PfxFile</td>
</tr>
<tr>
<td></td>
<td>• CertificateName</td>
</tr>
<tr>
<td><strong>PfxFile</strong></td>
<td>If the selected certificate info type is PfxFile, Enter the following:</td>
</tr>
<tr>
<td></td>
<td>• File Path - pfx file path (Required)</td>
</tr>
<tr>
<td></td>
<td>• Password - Valid Password (Required)</td>
</tr>
<tr>
<td><strong>CertificateName</strong></td>
<td>If the selected certificate info type is Certificate Name, Enter the following:</td>
</tr>
<tr>
<td></td>
<td>• Subject - Subject of the certificate (Required)</td>
</tr>
<tr>
<td></td>
<td>• Select one of the following StoreType:</td>
</tr>
<tr>
<td></td>
<td>• User</td>
</tr>
<tr>
<td></td>
<td>• System</td>
</tr>
<tr>
<td></td>
<td>• SpecificStore</td>
</tr>
<tr>
<td><strong>SpecificStore</strong></td>
<td>If the selected store type is SpecificStore, Enter the following:</td>
</tr>
<tr>
<td></td>
<td>• StoreName - Enter the store name</td>
</tr>
</tbody>
</table>
Return Values

A success or failure message is returned.

New-ASCatalog

You can use the `New-ASCatalog` cmdlet to create a new Application Catalog.

Examples

The following is the syntax used to create a new Application Catalog:

```
New-ASCatalog -CatalogName NameOfNewCatalog
```

For example:

```
New-ASCatalog -CatalogName CAT2016FEB
```

Important • When AdminStudio executes the `New-ASCatalog` cmdlet, it uses the upgrade.xml file, which contains a list of the SQL scripts that need to be run to create a new Application Catalog. By default, the upgrade.xml file is installed in the Support subdirectory of the AdminStudio installation directory. If you want to create a new Application Catalog using an upgrade.xml file in a different location, you need to provide the path to that file in the `New-ASCatalog` cmdlet, such as:

```
New-ASCatalog C:\MyScripts -CatalogName MyNewCatalog
```

Note • Before using the `New-ASCatalog` cmdlet to create a new Application Catalog, you need to have already used the `Set-ASConfigPlatform` cmdlet with the `ConnectionString` parameter to enter the connection information to the SQL database.

Parameters

The `New-ASCatalog` cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CatalogName</td>
<td>Use to enter a name for the new Application Catalog. Upon successful creation, you will be automatically connected to the new Application Catalog.</td>
</tr>
</tbody>
</table>
Return Values

A success or failure message is returned.

New-ASDistributionConnection

Administration Studio 2019 | Administration Studio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with Administration Studio Enterprise Edition and with Workflow Manager.

You can use the New-ASDistributionConnection cmdlet to use PowerShell to define named connections to System Center Configuration Manager, Citrix XenApp Server, Symantec Altiris Management Server, and Workspace ONE Server distribution systems. This enables you to refer to those connection settings by name in Administration Studio PowerShell Cmdlets cmdlets.

Example

New-ASDistributionConnection
-Name SCCM2012
-PluginID 0
-ServerAddress 172.01.02.03
-SiteCode ABC
-DistributionWindowsAuthentication 0
-DistributionUser MyDomain\UserName
-DistributionPassword Password123
-ShareWindowsAuthentication 0
-SharePath \172.01.02.03\SharedLocation
-ShareUserName MyDomain\UserName
-SharePassword Password123
Parameters

The `New-ASDistributionConnection` cmdlet has the following parameters:

**Table 22-27 • New-ASDistributionConnection Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Use to specify the name of this new named connection to a distribution system.</td>
</tr>
<tr>
<td>PluginID</td>
<td>Use to specify the plug-in with which the distribution system is associated. This parameter is mapped to the object identifier (OID) of the <code>ASCMSupportedPackageTypes</code> database table; you can provide any value available in this table to identify the plug-in.</td>
</tr>
<tr>
<td>ServerAddress</td>
<td>Use to specify the distribution server address.</td>
</tr>
<tr>
<td>SiteCode</td>
<td>When connecting to a System Center Configuration Manager distribution system, use to specify the site code.</td>
</tr>
<tr>
<td>DistributionWindowsAuthentication</td>
<td>Use to specify whether the distribution connection should use Windows Authentication or a custom user name and password. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• 0 = Do not use Windows Authentication</td>
</tr>
<tr>
<td></td>
<td>• 1 = Use Windows Authentication</td>
</tr>
<tr>
<td>[DistributionUser]</td>
<td>If not using Windows Authentication, use this parameter to specify the user name to use when connecting to the distribution system.</td>
</tr>
<tr>
<td>[DistributionPassword]</td>
<td>If not using Windows Authentication, use this parameter to specify the password to use when connecting to the distribution system.</td>
</tr>
<tr>
<td>SharePath</td>
<td>Use to specify the path to which packages are published.</td>
</tr>
<tr>
<td>ShareWindowsAuthentication</td>
<td>Use to specify whether the share path should use Windows Authentication or a custom user name and password. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• 0 = Do not use Windows Authentication</td>
</tr>
<tr>
<td></td>
<td>• 1 = Use Windows Authentication</td>
</tr>
<tr>
<td>[ShareUserName]</td>
<td>If not using Windows Authentication, use this parameter to specify the user name to use when connecting to the share path.</td>
</tr>
<tr>
<td>[SharePassword]</td>
<td>If not using Windows Authentication, use this parameter to specify the password to use when connecting to the share path.</td>
</tr>
</tbody>
</table>
**Return Values**

No values are returned.

---

**New-ASCreateSoftwareTag**

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

---

*Edition* • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition.*

You can use the `New-ASCreateSoftwareTag` cmdlet to create a new Software Tag.

---

**Examples**

The following is the syntax used to create a new Software Tag:

```
New-ASCreateSoftwareTag -PackageID 1
```

---

**Parameters**

The `New-ASCreateSoftwareTag` cmdlet has the following parameters:

---

**Table 22-28 • New-ASCreateSoftwareTag Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageID</td>
<td>ID of the package that will be returned from the catalog</td>
</tr>
</tbody>
</table>

---

*Note* • For more information to set the software tag properties see `Set-ASSoftwareTagProperties`.

---

**Return Values**

A success or failure message is returned.

---

**Remove-ASApplication**

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

---

*Edition* • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

You can use the `Remove-ASApplication` cmdlet to delete a package using its `ApplicationId`.

---

*Note* • The `Remove-ASApplication` cmdlet removes the linked packages and applications as well as the targeted packages and applications for each respective operation.
Example

The following is the syntax used to delete an application:

Remove-ASApplication-ID nn

For example:

Remove-ASApplication-ID 67

Parameters

The Remove-ASApplication cmdlet has the following parameters:

Table 22-29 • Remove-ASApplication Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Specifies the ID for the application which is being removed. (Required)</td>
</tr>
</tbody>
</table>

Returns

One of the following values is returned:

- 0—Success. The delete operation completed successfully.
- 1—Insufficient access rights. Permission to Delete is not available.
- 2—Object is locked. The group contains locked virtual packages. You will need to unlock the virtual packages in order to delete the group.
- 3—General failure. Operation did not complete successfully.
- 4—Protected group. The deletion of protected groups is prohibited.
- 5—Item not found. The requested item could not be deleted because it could not be found.

Remove-ASGroup

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Remove-ASGroup cmdlet to delete a group using its GroupID.

Note • The Remove-ASGroup cmdlet removes the linked packages and applications as well as the targeted packages and applications for each respective operation.

Example

The following is the syntax used to delete a group:

Remove-ASGroup-ID nn
For example:

Remove-ASGroup -ID 32

**Parameters**

The Remove-ASGroup cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Specifies the ID for the group which is being removed. (Required)</td>
</tr>
</tbody>
</table>

**Returns**

One of the following values is returned:

- 0 — Success. The delete operation completed successfully.
- 1 — Insufficient access rights. Permission to **Delete** is not available.
- 2 — Object is locked. The group contains locked virtual packages. You will need to unlock the virtual packages in order to delete the group.
- 3 — General failure. Operation did not complete successfully.
- 4 — Protected group. The deletion of protected groups is prohibited.
- 5 — Item not found. The requested item could not be deleted because it could not be found.

**Remove-ASPackage**

*Edition* • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

You can use the Remove-ASPackage cmdlet to delete a package using its PackageId.

*Note* • The Remove-ASPackage cmdlet removes the linked packages and applications as well as the targeted packages and applications for each respective operation.

**Example**

The following is the syntax used to delete a package:

Remove-ASPackage -ID nn

For example:

Remove-ASPackage 45
Parameters

The Remove-ASPackage cmdlet has the following parameters:

Table 22-31 • Remove-ASPackage Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Specifies the package ID for the package which is being removed. (Required)</td>
</tr>
</tbody>
</table>

Returns

One of the following values is returned:

- 0 — Success. The delete operation completed successfully.
- 1 — Insufficient access rights. Permission to **Delete** is not available.
- 2 — Object is locked. The group contains locked virtual packages. You will need to unlock the virtual packages in order to delete the group.
- 3 — General failure. Operation did not complete successfully.
- 4 — Protected group. The deletion of protected groups is prohibited.
- 5 — Item not found. The requested item could not be deleted because it could not be found.

Resolve-ASPackage

You can use the Resolve-ASPackage cmdlet to run application compatibility fixes on a package. This only picks up issues that are fixable. This will also return the path to fix transform that was produced, so the user can start a re-import.

Example

The following is the syntax used to run application compatibility fixes on a package:

```
Resolve-ASPackage -PackageId *n*-DetailedResults
```

For example:

```
Resolve-ASPackage -PackageId 45-DetailedResults
```
Parameters

The Resolve-ASPackage cmdlet has the following parameters:

Table 22-32 • Resolve-ASPackage Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>Specifies the package ID for the package on which fixes need to be run. (Required)</td>
</tr>
<tr>
<td>[DetailedResults]</td>
<td>Returns detailed results of the operation. If this parameter is not used, the Resolve-ASPackage cmdlet returns a summary of the operation.</td>
</tr>
</tbody>
</table>

Returns

Either a summary of results or detailed results are returned, depending upon whether the -DetailedResults parameter was used.

Set-ASCatalog

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Set-ASCatalog cmdlet to upgrade an existing Application Catalog from one version to another.

Before using the Set-ASCatalog cmdlet to upgrade an existing Application Catalog, you first need to identify and connect to that Application Catalog using the Set-ASConfigPlatform cmdlet with the ConnectionString parameter.

Examples

The following is the syntax used to upgrade an existing Application Catalog:

```
Set-ASCatalog
```

When the Set-ASCatalog cmdlet is executed, AdminStudio detects the version of the connected Application Catalog and upgrades it to the latest version listed in the upgrade.xml file.
Parameters

The Set-ASCatalog cmdlet includes the following parameters:

### Table 22-33 • Set-ASCatalog Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ScriptPath]</td>
<td>When AdminStudio executes the Set-ASCatalog cmdlet, it uses the upgrade.xml file, which contains a list of the SQL scripts that need to be run to upgrade an Application Catalog. By default, the upgrade.xml file is installed in the Support subdirectory of the AdminStudio installation directory. If you want to upgrade an Application Catalog using an upgrade.xml file in a different location, you need to use this parameter to provide the path to that file: Set-ASCatalog -ScriptPath C:\MyScripts</td>
</tr>
</tbody>
</table>

Return Values

A success or failure message is returned.

Set-ASConfigPlatform

**AdminStudio 2019 | AdminStudio PowerShell Cmdlets**

- **Edition** • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

Use this cmdlet to set defaults for most of the parameters. These defaults will be used when a specific argument/setting is not overridden in various other PowerShell cmdlets under AdminStudio Platform.

For example, if you want to set the default virtual technology to use for all your conversions, then use:

```powershell
Set-ASConfigPlatform-BuildAppV 1
```

Then during conversion, if you do not specify any virtual technology parameter, the above defaults will be used.

**Example**

The following is an example of the Set-ASConfigPlatform cmdlet and its ConnectionString parameter with SQL Server authentication:

```powershell
Set-ASConfigPlatform-ConnectionString "PROVIDER=SQLOLEDB.1;Data Source=SCHLTENG01\MSSQL_5500;User ID=jsmith; Password=admin8032 InitialCatalog=MKTGCAT2016;"
```

The following is an example of the Set-ASConfigPlatform cmdlet and its ConnectionString parameter with Windows NT authentication:

```powershell
Set-ASConfigPlatform-ConnectionString "PROVIDER=SQLOLEDB.1;Data Source=SCHLTENG01\MSSQL_5500;Integrated Security=SSPI; InitialCatalog=MKTGCAT2016;"
```
Parameters

The Set-ASConfigPlatform cmdlet has the following parameters:

Table 22-34 • Set-ASConfigPlatform Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ConnectionString]</td>
<td>Sets the default connection string for the AdminStudio Platform. A connection string consists of a set of elements, separated by semi-colons.</td>
</tr>
<tr>
<td></td>
<td>• PROVIDER—Because AdminStudio only supports SQL Server databases, this element must always be set to SQLOLEDB.1.</td>
</tr>
<tr>
<td></td>
<td>• Data Source—Identifies the database server.</td>
</tr>
<tr>
<td></td>
<td>• Initial Catalog—Identifies the Application Catalog name.</td>
</tr>
</tbody>
</table>

The elements used in the connection string vary depending upon the authentication method you are using.

**SQL Server Authentication**

When using this authentication method, you need to include the User ID and Password elements to provide the SQL Server login credentials:

```
PROVIDER=SQLOLEDB.1;
    Data Source=SCHLTENG01\MSSQL_5500;
    User ID=UserName;
    Password=passwd;
    Initial Catalog=CatalogName;
```

**Windows NT Authentication**

When using this authentication method, you need to include the Integrated Security=SSPI element to specify that you are using Windows NT authentication:

```
PROVIDER=SQLOLEDB.1;
    Data Source=SCHLTENG01\MSSQL_5500;
    Initial Catalog=CatalogName;
    Integrated Security=SSPI;
```

**Note** • The connection string is encrypted before setting in the PlatformSettings.xml file.
### Table 22-34 • Set-ASConfigPlatform Parameters (cont.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Group]</td>
<td>Use to specify the default group name where all imported packages should be placed.</td>
</tr>
<tr>
<td></td>
<td><img src="https://example.com/note" alt="Note" /> • This setting can be overridden by the Invoke-ASImportPackage cmdlet.</td>
</tr>
<tr>
<td></td>
<td><img src="https://example.com/note" alt="Note" /> • This default group does not need to already exist in Application Catalog in order for the platform cmdlets to work.</td>
</tr>
<tr>
<td></td>
<td>Also, when specifying the Group parameter, you need to include the Applications root group in the path to the group. For example: Set-ASConfigPlatform -BuildAppV 1 -Group &quot;Applications\SubGroup\SubGroup1&quot; If you do not include the Applications root group in the path, the packages will be imported under the root node instead of the specified folder path.</td>
</tr>
<tr>
<td>[AACSettingsFile]</td>
<td>Specify the Automated Application Converter project file (.aacx) to use for all conversion tasks. This setting can be overridden by individual conversion cmdlets.</td>
</tr>
<tr>
<td>[OutputPath]</td>
<td>Specify the default output folder under which all virtualized packages will be stored. This setting can be overridden by individual conversion cmdlets.</td>
</tr>
<tr>
<td>[HardTimeout]</td>
<td>Hard time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[SoftTimeout]</td>
<td>Soft time-out (in minutes) for the package installation.</td>
</tr>
<tr>
<td>[BuildAppV]</td>
<td>Build Microsoft App-V packages (*.sft). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildXenApp]</td>
<td>Build Citrix XenApp profiles (*.profile). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildThinApp]</td>
<td>Build VMWare ThinApp packages (*.exe). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[BuildMSI]</td>
<td>Build Windows Installer packages (*.msi). Specify 0 (do not build) or 1 (build).</td>
</tr>
<tr>
<td>[AppVServerHost]</td>
<td>Host name portion of the server location for App-V packages.</td>
</tr>
<tr>
<td>[AppVServerPort]</td>
<td>Port number portion of the server location for App-V packages.</td>
</tr>
</tbody>
</table>

### Return Values

No values are returned.
Set-ASDistributionProperty

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Set-ASDistributionProperty cmdlet to set the property value of the distribution system for a package. The property name is obtained from the Property_PluginId table for the corresponding distribution system. The property value should be the display text that is displayed in the AdminStudio user interface.

Example

The following is an example of the Set-ASDistributionProperty cmdlet:

Set-ASDistributionProperty-PackageId 10-SystemConnectionName 'Altiris'-PropertyName 'PackageName'-PropertyValue 'PackageABC'

Important • All parameters are mandatory.

Parameters

The Set-ASDistributionProperty cmdlet has the following parameters:

Table 22-35 • Set-ASDistributionProperty Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>(Required) Use to specify the ID number of the package that you want to set distribution properties for. The ID number is obtained from the cstblPackage table.</td>
</tr>
<tr>
<td>-SystemConnectionName</td>
<td>(Required) Use to specify a named connection to a deployment system. See Creating Multiple Named Connections to Distribution Systems for more information.</td>
</tr>
<tr>
<td>PropertyName</td>
<td>(Required) Use to specify the name of the property that you want to set. The name of the property is fetched from the Property_PluginId table for the corresponding distribution system.</td>
</tr>
<tr>
<td>PropertyValue</td>
<td>(Required) Use to specify the value of the distribution property that you want to set. For enum values, specify the display text of the drop down selection that is displayed in the AdminStudio user interface.</td>
</tr>
</tbody>
</table>

Return Value

One of the following values is returned:

- **True**—Property value is set.
- **False**—Property value is not set.
Set-ASProperty

You can use the Set-ASProperty cmdlet to set the application model properties of a package.

- Example
- Parameters
- Available Application Properties
- Available Deployment Type Properties

Note • The Set-ASProperty cmdlet supports only System Center Configuration Manager distribution-level properties. To set other distribution-level properties for a package, use Set-ASDistributionProperty.

Example

To set application model properties using the Set-ASProperty cmdlet, use the following syntax:

Set-ASProperty -PackageName "Name" -PropertyValue "Value"

where:

- Name—Name of application model property.
- Value—Value of application model property.
- n—Package ID number.

For example, you would use the following code to set the PrestagedDPSetting property to ManualCopy:

Set-ASProperty -PropertyName "PrestagedDPSetting" -PropertyValue "ManualCopy" -PackageID 1

To set multiple properties simultaneously, you should create a PowerShell script file containing multiple Set-ASProperty cmdlets, such as:

Set-ASProperty -PropertyName "PrestagedDPSetting" -PropertyValue "ManualCopy" -PackageID 1
Set-ASProperty -PropertyName "AutoInstall" -PropertyValue "True" -PackageID 1
Set-ASProperty -PropertyName "RunAs32" -PropertyValue "False" -PackageID 1
Parameters

The Set-ASProperty cmdlet includes the following parameters:

Table 22-36 • Set-ASProperty Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PropertyName</td>
<td>Use to specify the name of the application model property that you want to set.</td>
</tr>
<tr>
<td>PropertyValue</td>
<td>Use to specify the value of the application model property that you want to set.</td>
</tr>
</tbody>
</table>

Available Application Properties

The following application properties that appear on the Application View can also be set using the Set-ASProperty cmdlet:

- General Information Tab
- App Portal Information Tab

General Information Tab

The following application properties can be set using the Set-ASProperty cmdlet. These properties are also displayed on the General Information tab of the Application Catalog Application View.

Table 22-37 • Application View / General Information Tab Properties

<table>
<thead>
<tr>
<th>Name Displayed in Application Catalog</th>
<th>Property Name</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator comments</td>
<td>Description</td>
<td>Any string value</td>
</tr>
<tr>
<td>Manufacturer</td>
<td>Publisher</td>
<td>Any string value</td>
</tr>
<tr>
<td>Install from Install Application task sequence</td>
<td>AutoInstall</td>
<td>True False</td>
</tr>
<tr>
<td>Distribution priority</td>
<td>DistributionPriority</td>
<td>High Medium Low</td>
</tr>

<td>FID</td>
<td>Flexera ID not found, Not connected to Flexera Service Gateway, Multiple applications detected, Error while fetching Flexera ID, Not synchronized with FlexNet Manager Platform</td>
</tr>
</tbody>
</table>

#### Table 22-37 • Application View / General Information Tab Properties

<table>
<thead>
<tr>
<th>Name Displayed in Application Catalog</th>
<th>Property Name</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Categories</td>
<td>Categories</td>
<td>String value of path to existing category. For example: Set-ASProperty -PackageID 1 -PropertyName &quot;Categories&quot; -PropertyValue &quot;HR/Office/Excel 2007&quot; Set-ASProperty -PackageID 1 -PropertyName &quot;Categories&quot; -PropertyValue &quot;HR/Office/Excel 2007,IT/Software/Excel&quot; Multiple categories can be set by separating them by a comma.</td>
</tr>
</tbody>
</table>

**Important** • Categories must already exist in App Portal. If you attempt to use `Set-ASProperty` to assign an application to a non-existent category, the cmdlet will fail.
Available Deployment Type Properties

The following deployment type properties that appear on the Home Deployment Type View can also be set using the Set-ASProperty cmdlet.

• Package Information Tab
• Deployment Data Tab

Package Information Tab

The following deployment type properties can be set using the Set-ASProperty cmdlet. These properties are also displayed on the Package Information tab of the Application Catalog Home Deployment Type View.

Table 22-39 • Home Deployment Type View / Package Information Tab Properties

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Keywords</td>
<td>Keywords</td>
<td>Single or comma-delimited list of keywords. For example:</td>
</tr>
</tbody>
</table>

Set-ASProperty -PackageID 1 -PropertyName "Keywords" -PropertyValue "Admin"

Set-ASProperty -PackageID 1 -PropertyName "Keywords" -PropertyValue "Admin,IT,HR"

**Note** • When using the Set-ASProperty cmdlet to assign keywords to an application, follow these rules:

• Until you create a keyword using either the Add-ASKeywords cmdlet or the Edit Keywords dialog box, you cannot use the Set-ASProperty cmdlet to assign it to an application. If you attempt to do so, an error will be returned.
• If you attempt to assign multiple keywords (in a comma-delimited list) to an application, if one of them has not yet been created, the cmdlet will fail and no keywords will be assigned.
• If you attempt to assign a duplicate keyword to an application using the Set-ASProperty cmdlet, the cmdlet will fail.
• Do not use the single-quote character (‘) in a keyword.
Deployment Data Tab

In Application Catalog, deployment type properties are displayed on the Deployment Data tab of the Application Catalog Home Deployment Type View on the following subtabs:

- Content Subtab
- Programs Subtab
- User Experience Subtab

**Content Subtab**

The following properties, which are displayed on the Content subtab of the Deployment Type tab, can be set using the Set-ASProperty cmdlet of the AdminStudio PowerShell Cmdlets.

> **Note**: Class can be of ASCMMSCContent, ASCMScriptContent, or ASCMAppvContent.

Table 22-40 • Home Deployment Type View / Content Subtab

<table>
<thead>
<tr>

Set-ASSoftwareRepositoryState

**AdminStudio 2019 | AdminStudio PowerShell Cmdlets**

---

**Edition** • *Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.*

You can use the `Set-ASSoftwareRepositoryState` cmdlet to perform CheckOut and UndoCheckOut operations on a Software Repository-enabled Application Catalog.

---

**Note** • *The CheckIn operation is restricted to the user interface and is not supported through the Set-ASSoftwareRepositoryState API.*

---

**Example**

The following is the syntax used to check out a package from the Software Repository:

`Set-ASSoftwareRepositoryState-PackageId nnnn-State state`

For example:

`Set-ASSoftwareRepositoryState-PackageId 45-State CheckOut`

---

**Parameters**

The `Set-ASSoftwareRepositoryState` cmdlet has the following parameters:

**Table 22-43 • Set-ASSoftwareRepositoryState Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId</td>
<td>(Required) Use to specify the ID number of the package to be checked out or have its checkout canceled.</td>
</tr>
</tbody>
</table>
| State          | (Required) Use one of the following values to specify the change you want to make to the Software Repository state:  
  • CheckOut  
  • UndoCheckOut |

---

**Returns**

When executed, one of the following values is returned:

**Table 22-44 • Return Values for Set-ASSoftwareRepositoryState**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The state change was successful.</td>
</tr>
<tr>
<td>-1</td>
<td>Error: Package directory was not found.</td>
</tr>

</table>

**Set-ASTestState**

*AdminStudio 2019 | AdminStudio PowerShell Cmdlets*

**Edition** • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

You can use the Set-ASTestState cmdlet to set a given test to either run or not run.

**Example**

The following is the syntax used to specify whether or not a test will run:

```powershell
Set-ASTestState-TestId nnnn-TestState 0
```

For example:

```powershell
Set-ASTestState-TestId 0401-TestState 0
```
Parameters

The ASTestState cmdlet has the following parameters:

Table 22-45 • ASTestState Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TestId</td>
<td>Use to specify the ID number of the test whose test state you want to set.</td>
</tr>
<tr>
<td></td>
<td>This is the same ID number that identifies the test on the Application</td>
</tr>
<tr>
<td></td>
<td>Catalog Select Tests to Execute dialog box. (Required)</td>
</tr>
<tr>
<td>TestState</td>
<td>(Required) Use one of the following values to specify a test state:</td>
</tr>
<tr>
<td></td>
<td>• 1 = Select test</td>
</tr>
<tr>
<td></td>
<td>• 0 = Clear the selection of the test</td>
</tr>
</tbody>
</table>

Returns

One of the following values is returned:

• True—Operation was successful.
• False—Operation was not successful.

Set-ASSoftwareTagProperties

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition.

You can use the Set-ASSoftwareTagProperties cmdlet to set the software tag properties.

Example

The following is the syntax used to set the software tag properties:

Set-ASSoftwareTagProperties -PackageId 1 -RequireSoftwareEntitlement 1 -SoftwareCreatorRegId "regid.YYYY-MM.ReversedDomainName,division."
Parameters

The `ASSoftwareTagProperties` cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequireSoftwareEntitlement</td>
<td>(Required) Use one of the following values to specify a software entitlement:</td>
</tr>
<tr>
<td></td>
<td>• 1 = Software must be purchased</td>
</tr>
<tr>
<td></td>
<td>• 0 = Software is free</td>
</tr>
<tr>
<td>TagCreatorName</td>
<td>Use to enter a name to identify the creator of this tag file, the default</td>
</tr>
<tr>
<td></td>
<td>value is Flexera Software LLC.</td>
</tr>
<tr>
<td>TagCreatorRegID</td>
<td>(Required) Use to enter a RegID to identify the creator of this tag file,</td>
</tr>
<tr>
<td></td>
<td>using the following format:</td>
</tr>
<tr>
<td></td>
<td>regid.YYYY-MM.ReversedDomainName,optional_division</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>regid.2009-06.com.yourcompany,GlobalProductDivision</td>
</tr>
<tr>
<td>SoftwareCreatorName</td>
<td>Enter a name to identify the creator of this package. By default, the value</td>
</tr>
<tr>
<td></td>
<td>is Unknown. If the value of this field is left as Unknown, then that exact</td>
</tr>
<tr>
<td></td>
<td>string will appear in the tag file to indicate that it is not possible to</td>
</tr>
<tr>
<td></td>
<td>determine the actual value for this field.</td>
</tr>
<tr>
<td>SoftwareCreatorRegID</td>
<td>(Required) Use to enter a RegID to identify the creator of this package. By</td>
</tr>
<tr>
<td></td>
<td>default, the value is Unknown. If the value of this field is left as</td>
</tr>
<tr>
<td></td>
<td>Unknown, then that exact string will appear in the tag file to indicate</td>
</tr>
<tr>
<td></td>
<td>that it is not possible to determine the actual value for this field.</td>
</tr>
<tr>
<td>SoftwareLicenseName</td>
<td>Use to enter a name to identify the licensor of this package. By default,</td>
</tr>
<tr>
<td></td>
<td>the value is Unknown. If the value of this field is left as Unknown, then</td>
</tr>
<tr>
<td></td>
<td>that exact string will appear in the tag file to indicate that it is not</td>
</tr>
<tr>
<td></td>
<td>possible to determine the actual value for this field.</td>
</tr>
<tr>
<td>SoftwareLicensorRegID</td>
<td>(Required) Use to enter a RegID to identify the licensor of this package. By</td>
</tr>
<tr>
<td></td>
<td>default, the value is Unknown. If the value of this field is left as</td>
</tr>
<tr>
<td></td>
<td>Unknown, then that exact string will appear in the tag file to indicate</td>
</tr>
<tr>
<td></td>
<td>that it is not possible to determine the actual value for this field.</td>
</tr>
</tbody>
</table>

Returns

A success or failure message is returned.

Start-ASConversion

- **Edition**: Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.
Use the Start-ASConversion cmdlet to start Automatic Application Converter using a given .aacx file. This cmdlet is usually used after you have added one or more packages using the Add-ASPackageForConversion cmdlet, which returns a path to an .aacx file. This .aacx file is then passed to the Start-ASConversion cmdlet to start the conversion.

**Examples**

The following are examples of how to use the Start-ASConversion cmdlet:

Start-ASConversion-AACSettings "C:\Personal\AAC\test.aacx" -BuildMSI

Start-ASConversion-AACSettings "C:\Personal\AAC\test.aacx"-OutputPath "C:\Result"-BuildAppV-BuildXenApp-BuildSymantec-BuildThinApp -BuildMSI

**Parameters**

The Start-ASConversion cmdlet has the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AACSettings</td>
<td>The Automated Application Converter project file to use for Conversion. Use to specify the Automated Application Converter project file to use during conversion. If it is not supplied, a copy of the project file specified in the platform settings file will be used.</td>
</tr>
<tr>
<td>[VMPlatform]</td>
<td>Specify platform to use for automated repackaging, such as 600Sx64, 501, or 502S.</td>
</tr>
<tr>
<td>[OutputPath]</td>
<td>Output folder under which all output will be collected.</td>
</tr>
<tr>
<td>[BuildAppV]</td>
<td>Specify this parameter to build App-V packages.</td>
</tr>
<tr>
<td>[BuildXenApp]</td>
<td>Specify this parameter to build Citrix XenApp profiles.</td>
</tr>
<tr>
<td>[BuildThinApp]</td>
<td>Specify this parameter to build VMWare ThinApp packages.</td>
</tr>
<tr>
<td>[BuildMSI]</td>
<td>Specify this parameter to build Windows Installer packages.</td>
</tr>
</tbody>
</table>

**Return Values**

The path to an .aacx file is returned.

**Test-ASConflicts**

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • PowerShell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

The Test-ASConflicts cmdlet performs conflict analysis between a source package and target packages.

When using the Test-ASConflicts cmdlet:
• The package needs to exist in the Application Catalog.
• You can run the analysis against a list of other PackageIDs, or specify an existing group name to run the analysis against all packages in that group.
• If none of these targets are specified, then the group in which the source package exists will be used for analysis. You can optionally specify a comma-separated list of rule names to run.

Examples
Test-ASConflicts-PackageID 21-TargetGroups MyApplications-Rules ACE03,ACE04

Parameters
The Test-ASConflicts cmdlet has the following parameters:

Table 22-48 • Test-ASConflicts Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageID</td>
<td>Use to specify the source package in the conflict analysis.</td>
</tr>
<tr>
<td>[TargetGroups]</td>
<td>Use to specify the group name(s) of the groups against which you want to compare the source package for conflicts.</td>
</tr>
<tr>
<td>[TargetPackageIDs]</td>
<td>Use to specify the Package IDs of the packages against which you want to compare the source package for conflicts.</td>
</tr>
<tr>
<td>[Rules]</td>
<td>Use to specify the rules to evaluate during the conflict analysis.</td>
</tr>
</tbody>
</table>

Return Values
A list of test results is returned.

Test-ASPackage

AdminStudio 2019 | AdminStudio PowerShell Cmdlets

Edition • Powershell cmdlets are enabled with AdminStudio Enterprise Edition and with Workflow Manager.

The Test-ASPackage cmdlet performs testing on a specified package. Using this cmdlet is equivalent to selecting the package in the Application Catalog tree of the Analyze tab and clicking the Execute Tests button. When using the AdminStudio PowerShell Cmdlets to perform testing, the tests appropriate to the package that are selected in AdminStudio Application Catalog on the Select Tests to Execute dialog box are executed.
Examples

Test-ASPackage- PackageId nnn-DetailedResults

Parameters

The Test-ASPackage cmdlet has the following parameters:

Table 22-49 • Test-ASPackage Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PackageId nnn</td>
<td>Use to identify the package which needs to be tested.</td>
</tr>
<tr>
<td>[DetailedResults]</td>
<td>Add this parameter to return individual result data for the tests that were run.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is not included, then the cmdlet returns a summary of the test execution and just includes the number of errors and warnings encountered in the test run.</td>
</tr>
</tbody>
</table>

Return Values

A list of test results is returned.
